The Chalk Country.—The dominating surface-feature formed by the Cretaceous rocks is the Chalk escarpment, the northern edge of the great sheet of chalk that once spread continuously over the whole south-east. It appears as a series of rounded hills of no great elevation, running in a curve from the mouth of the Axe to Flamborough Head, roughly parallel with the Oolitic escarpment. Successive portions of this line of heights are known as the Western Downs, the White Horse hills, the Chiltern hills, the East Anglian ridge, the Lincolnshire Wolds and the Yorkshire Wolds. The rivers from the gentle southern slopes of the Oolitic heights pass by deep valleys through the Chalk escarpments, and flow on to the Tertiary plains within. The hills of the Chalk country rise into rounded downs, often capped with clumps of beech, and usually covered with thin turf, affording pasture for sheep. The chalk, when exposed on the surface, is an excellent foundation for roads, and the lines of many of the Roman "streets" were probably determined by this fact. The Chalk country extends over part of Dorset, most of Wiltshire, a considerable portion of Hampshire and Oxfordshire, most of Hertfordshire and Cambridgeshire, the west of Norfolk and Suffolk, the east of Lincolnshire, and the East Riding of Yorkshire. From the upland of Salisbury plain, which corresponds to the axis of the anticline marking the centre of the double fold into which the strata of the south of England have been thrown, the great Chalk escarpment runs north-eastward; fingers of Chalk run eastward one each side of the Weald, forming the North and South Downs, while the southern edge of the Chalk sheet appears from beneath the Tertiary strata at several places on the south coast, and especially in the Isle of Wight. Flamborough Head, the South Foreland, Beachy Head and the Needles are examples of the fine scenery into which chalk weathers where it fronts the sea, and these white cliffs gave to the island its early name of Albion. The chalk supports only a small population, except where it is thickly covered with boulder clay, and so becomes fertile, or where it is scored by drift-filled valleys, in which the small towns and villages are dotted along the high roads. The thickest covering of drift is found in the Holderness district of Yorkshire. Of the few towns in the Chalk country, the same may be said as of those on the Jurassic belt, that their interest is historical or scholastic; Salisbury, Winchester, Marlborough and Cambridge are the most distinguished. Reading manufacturing biscuits flourishes from its position on the edge of the London basin. The narrow strip of Greensands appearing from beneath the Chalk escarpment on its northern side is crowded with small towns and villages on account of the plentiful water-supply.

The Fenlands.—The continuity of the belts of Chalk and of the Middle and Upper Oolites in the Eastern plain is broken by the shallow depression of the Wash and the Fenlands. The Fenland comprises a strip of Norfolk, a considerable part of Cambridgeshire, and the Holland district of Lincoln. Formerly part of the channel of a large river draining to join an extended Thames in the region now the North sea, the region is now low, flat and marshy, and for the most part within 15 ft. of sea-level; the seaward edge in many places is below the level of high tide, and is protected by dykes as in Holland, while straight canals and ditches carry the sluggish drainage from the land. The soil is composed for the most part of silt and peat. In early times it offered seclusion to the hermit and saint, but a line of approach to raiders from the sea. The difficult nature of the country made its Isle of Ely the last stronghold of Hereward the Wake against the Normans. With the drainage schemes of the 17th century, much land was reclaimed and the intensive agriculture of recent times is making for prosperity. Wheat, market gardening and sugar beet are important. A few elevations of gravel, or of underlying formations, rise above the 25 ft. level: these were in former times islands, and now they form the sites of a few villages. Boston and King's Lynn are memorials of the maritime importance of the Wash in the days of small ships. The numerous ancient churches and the cathedrals of Ely and Peterborough bear witness to the lead given by religious communities in the reclamation and cultivation of the land.

The Weald.—The dissection of the east and west anticline in the south-east of England has given a remarkable piece of country, occupying the east of Hampshire and practically the whole of Sussex, Surrey and Kent. The sheet of Chalk shows its cut edges in the escarpments facing the centre of the Weald, and surrounding it in oval fashion. The eastern end of the Weald is broken by the Strait of Dover, so that its completion must be sought in France. From the crest of the escarpment, all round on south, west and north, the dip-slope of the Chalk forms a gentle descent outwards, the escarpment a very steep slope inwards. The cut edges of the escarpment forming the Hog's Back and North Downs on the north, and the South Downs on the south, meet the sea in the fine promontories of the South Foreland and Beachy Head. The Downs are sparsely populated, waterless and grass-covered, with patches of beech wood. Their only important towns are on the coast, *e.g.*, Brighton, Eastbourne, Dover, Chatham, or in the gaps where rivers from the centre pierce the Chalk ring, as at Guildford, Rochester, Canterbury, Lewes and Arundel. Within the Chalk ring, and at the base of the steep escarpment, there is a low terrace of the Upper Greensand, seldom a mile in width, but in most places crowded with villages, ranged like beads on a necklace. Within the Upper Greensand an equally narrow ring of Gault is exposed, its stiff clay forming level plains of grazing pasture, without villages, and with few farmhouses; and from beneath it the successive beds of the Lower Greensand rise towards the centre, forming a wider belt, and reaching a considerable height before breaking off in a fine escarpment, the crest of which is in several points higher than the outer ring of Chalk. Leith hill and Hindhead are parts of this edge in the west, where the exposure is widest. Several towns have originated in the gaps of the Lower Greensand escarpment which are continuous with those through the Chalk: such are Dorking, Reigate, Maidstone and Ashford. Folkestone and Pevensey stand where the two ends of the broken ring meet the sea. It is largely a region of oak and pine trees, in contrast to the beech of the Chalk Downs The Lower Greensand escarpment looks inwards in its turn over the wide plain of Weald Clay, along which the Medway flows in the north, and which forms a fertile soil, well cultivated, and particularly rich in hops and wheat. The primitive forests have been largely cleared, the early marshes have all been drained, and now the Weald Clay district is well peopled and sprinkled with villages. From the middle of this plain the core of Lower Cretaceous sandstones emerges steeply, and reaches in the centre an elevation

of 796 ft. at Crowborough Beacon. It is on the whole a region with few streams, and a portion of the ancient woodland still remains in Ashdown forest. The forest ridges are poorly inhabited and towns are found only round the edge bordering the Weald Clay, such as Tonbridge, Tunbridge Wells and Horsham; and along the line where it is cut off by the sea, *e.g.*, Hastings and St. Leonards. The broad low tongue of Romney marsh running out to Dungeness is a product of shore-building by the Channel tides, attached to the Wealden area, but not essentially part of it.

The historical associations of the area are important as showing it to be the great gateway into England from the Continent. The south-east is the pivot on which Britain balances its Continental influences. Its fertile soil made it a region of early settlement and the large number of small ports along its shore line, giving choice of land to the little boats of early times driven by force of wind and tide, necessitated inland foci of the many landing places from the Continent, and in such positions there grew up Canterbury, characteristically the centre whence Roman Christians spread over England. The coast land remained dotted with active ports during the middle ages, the activity of the Cinque Ports (*q.v.*) and their satellites being famous. The mediaeval iron smelting dependent on the Weald forest lands ceased with the protection of the woodland and the use of coal on a large scale in other areas. It is possible that the recent development of the Kent coalfield may recreate this industry on a different basis. The rapid development of the coalfield with its deep pits and problems of transport is the outstanding feature of the south-east, linked up as it is with a remarkable regional-planning scheme calculated to avoid the overcrowded, dirty, ugly settlements with their many social difficulties that have hitherto characterized British industrial areas. Alongside this development is the extensive use of the region both as a holiday resort and as a residential area for the ever-growing metropolis.

The London Basin and East Anglia.—The London basin occupies a triangular depression in the Chalk which is filled up with clays and gravels of Tertiary and later age. It extends from the eastern extremity of Wiltshire in a widening triangle to the sea, which it meets along an irregular line from Deal to Cromer. It thus occupies parts of Wiltshire, Hampshire, Surrey, Kent, Berkshire, Hertfordshire, the whole of Middlesex, the county of London and Essex, and the eastern edge of Suffolk and Norfolk. The gravel hills are often prominent features, as at Harrow and in the northern suburbs of London; the country is now mainly under grass or occupied with market and nursery gardens, and many parts, particularly Epping forest, still retain much oak wood. The coast is everywhere low and deeply indented by ragged and shallow estuaries, that of the Thames being the largest. Shallow lagoons formed along the lower courses of the rivers of Norfolk have given to that part of the country the name of the Broads, a district of low and nearly level land. Apart from the immense area of urban and suburban London (for its development *see* separate article) the London basin has few large towns. Norwich and Ipswich, Yarmouth, Lowestoft, Harwich and Colchester may be mentioned in the north-eastern part, all depending for their prosperity on agriculture or on the sea; and a fringe of summer resorts on the low coast has arisen which depend on London's population. Reading and Windsor lie in the western portion beyond the suburban sphere of London. The Bagshot beds in the west form infertile tracts of sandy soil on which is situated Aldershot. The London clay in the east is more fertile and crowded with villages, while the East Anglian portion of the basin consists of the more recent Pliocene sands and gravels, which mix with the boulder clay to form the best wheat-growing soil in the country. This country appears to have had agricultural associations from the Bronze Age times and even at that time there was a long tradition of human settlement. Mediaeval contacts with the Flemish weavers over the North sea gave an impetus to the East Anglian woollen trade. Foodstuffs were also exported thither and before the days of coal East Anglia was one of the most important industrial and most populous regions of England. Rural beauty called forth some of England's greatest landscape painters, while centuries of contact with the Continent and especially with Flemish weavers, both traders and artisans, gave her people a broad vision in agricultural, economic, political and religious life, a factor that has to be considered when we remember the part she has played at important crises in the history of England.

London itself, as primarily the focus of its basin and the lowest Thames crossing, is too large a subject for treatment here, but its complementary relation to the estuarine ports of the Continental shores and its consequent facilities as an entrepôt, once England had become a great agent in the carrying trade, may be mentioned. The western suburban industrial growth, following application of electrical power in recent years, is portentous.

Hampshire Basin.—The remaining Tertiary basin for consideration forms a triangle between Dorchester, Salisbury and Worthing. The Tertiary rocks are enclosed by a vein of chalk which to the south appears in broken fragments in the Isle of Purbeck, the Isle of Wight and to the east of Bognor. On the infertile Bagshot beds is the large area known as the New Forest. Considerable sections are still under oak. The London Clay of the east is more fertile, but the feature of the district lies in its coastline, which is deeply indented like that of the London Basin. On a fine natural harbour, with deep water and a double inroad from the sea, stands Southampton—the focus of the Hampshire basin. It is well placed for direct services to northern France and for transatlantic traffic. The development of a network of railways in its hinterland has facilitated its contact with London and the remainder of the British Isles. It has recently become the leading passenger port of England and has developed secondary interests and trades dependent on a large collecting and distributing centre. Portsmouth, with another fine harbour, has specialized on naval work. Bournemouth and Bognor, from their favourable position in the sunniest belt of the country, have developed as health resorts. Winchester was of old an inland focus behind a number of harbours and was thus in some ways analogous with Canterbury (*see* above).

CLIMATE

The main features of the climate of England are dependent upon the passage from the North Atlantic of cyclones which are centres of low barometric pressure usually having phases of strong winds and much rainfall. Equally important for English weather is the extension of high-pressure systems (anti-cyclones) from the Continent or the neighbourhood of the Azores. These conditions bring calm, dry, sunny weather in summer and dry cold weather in winter. The alternation of these conditions, and particularly the relation of England to the Continental high pressure region in winter and low pressure region in summer, cause the variety of atmospheric conditions experienced. These conditions are always modified locally by the configuration of the land and lead to contrasts of climate on the western highlands and eastern lowlands of England. The fact that England is surrounded by the sea obviates extremes of heat and cold at all times. The chief paths of depressions from the Atlantic are from south-west to north-east across England; one track runs across the south-east and western counties, and is that followed by a large proportion of the summer and autumn storms. A second track crosses central England, entering by the Severn estuary and leaving by the Humber or the Wash; while a third crosses the north of England from the neighbourhood of Morecambe bay to the Tyne. Individual cyclones may and do cross the country in all directions, though very rarely indeed from east to west or from north to south.

The average barometric pressure normally diminishes from south-west to north-east at all seasons. The direction of the mean annual isobars shows that the normal wind in all parts of England and Wales must be from the south-west on the west coast, curving gradually until in the centre of the country and on the east coast it is westerly. The normal seasonal march of pressure-change produces a maximum gradient in December and January, and a minimum gradient in April. In spring the gradient is often slight enough for a temporary fall of pressure to the south of

England or rise to the north to reverse the gradient and produce an east wind over the whole country. The liability to east wind in spring is a marked feature of the climate especially on the east coast. The southerly component is most marked in the winter months, and westerly, predominating in summer.

Rainfall.—The Western or highland Area is the wettest at all seasons, each orographic group forming a centre of heavy precipitation. There are few places in the Western Area where the rainfall is less than 35in., while in the south-west, the Lake district and the southern part of the Pennine region the precipitation exceeds 40in., and in the Lake district considerable areas have a rainfall of over 60in. In the Eastern Area, on the other hand, an annual rainfall exceeding 30in. is rare, and in the low ground about the mouth of the Thames estuary and around the Wash the mean annual rainfall is less than 25in. In the Western Area and along the south coast the driest month is usually April or May, while in the Eastern Area it is February or March. The wettest month for most parts of England is October, the most noticeable exception being in East Anglia, where, on account of the frequency of summer thunderstorms, July is the month in which most rain falls, although October is not far behind. In the Western Area there is a tendency for the annual maximum of rainfall to occur later than October. It may be stated generally that the Western Area is mild and wet in winter, and cool and less wet in summer; while the Eastern Area is cold and dry in winter and spring, and hot and less dry in summer and autumn; that is the Eastern Area approximates more closely to continental conditions. The south coast occupies an intermediate position as regards climate.

Temperature.—The mean annual temperature of the whole of England and Wales (reduced to sea-level) is about 50° F, varying from something over 52° in the Scilly isles to something under 48° at the mouth of the Tweed. The mean annual temperature diminishes very regularly from south-west to north-east, the west coast being warmer than the east, so that the mean temperature at the mouth of the Mersey is as high as that at the mouth of the Thames. During the coldest month of the year (January) the mean temperature of all England is about 40°. The influence of the western ocean is very strongly marked, the temperature falling steadily from west to east. Thus while the temperature in the west of Cornwall is 44°, the temperature on the east coast from north of the Humber to the Thames is under 38°, the coldest winters being experienced in the Fenland. In the hottest month (July) the mean temperature is about 61·5°, and the westerly wind then exercises a cooling effect, the greatest heat being found in the Thames basin immediately around London, where the mean temperature of the month exceeds 64°: the mean temperature along the south coast is 62°, and that at the mouth of the Tweed a little under 59°. In the centre of the country along a line drawn from London to Carlisle the mean temperature in July is found to diminish gradually at an average rate of 1° per 60m. The coasts are cooler than the centre of the country, but the west coast is much cooler than the east, modified continental conditions prevailing over the North sea. Oceanic influence penetrates the midlands especially by way of the Severn estuary. The Mersey estuary, being partly sheltered by Ireland and north Wales, does not serve as an inlet for modifying influences to the same extent; and as the wind entering by it blows against the slope of the Pennines, it does not much affect the climate of the midland plain.

The amount of sunshine experienced in various places varies naturally with the seasons, but there is more sunshine recorded for some coastal regions than for the inland areas. The regions of England that get most sunshine are the south-west and a belt covering the south coast around East Anglia to the Fen country. The north-east including the Pennine region and the whole of Yorkshire is very cloudy. It is estimated that in Britain mists, fogs and clouds obscure the sun for about two-thirds of the time that it is above the horizon.

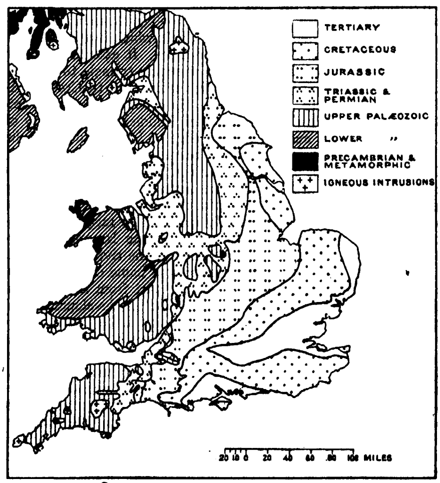
GEOLOGY

In a general account of the geological history of England it is natural to include Wales since the two have been intimately connected during geological time. Many of the major divisions of geological time are named after places or tribes in England or Wales, and it is fortunate that much of the early work on stratigraphy was done in a country where representatives of rocks of nearly every age are exposed at the surface.

The Pre-Cambrian formation, on which the later fossiliferous strata were deposited, appears at the surface only in small and scattered exposures; but these give indications of the earliest geological time in the island. Small areas of gneiss are found in Anglesey, N. Wales, the Malvern Hills and Cornwall which suggest that gneiss forms the basal rocks here as in Scotland and elsewhere. Following these, and probably considerably later in date, are certain volcanic and pyroclastic rocks found in Charnwood Forest, Nuneaton, Church Stretton, Malvern and elsewhere, whilst later still there are the red sandstones of the Longmynd which are in all probability of the same age as the Torridonian.

Thus, in the Pre-Cambrian there is evidence of a period of great earth-movement probably followed by violent volcanic action and finally the arid conditions of deposition of the Longmyndian. All these rocks were intensely folded, generally with a N.W.-S.E. strike, and formed the land masses and sea floor against and on which the first fossiliferous deposits were laid down.

Throughout Lower Palaeozoic times there was continuous deposition in a trough, one shore of which lay along the southern border of the Scottish Highlands while the other appears to have run more or less along the present line of the Pennines to Shropshire and S. Wales, with a second trough occupying much of the area of the present English Channel. Naturally the actual position of the shore-line varied from time to time. The Cambrian, Ordovician and Silurian together form one protracted marine period in this trough, during which the type of sediment was usually sand or finer mud with occasional thin limestones, whilst during the Ordovician period there were frequent and often important eruptions of volcanic material. These formed massive



GEOLOGICAL MAP OF ENGLAND AND WALES

beds of lava and ash which now weather into mountainous ground with bold crags and are responsible for much of the finest scenery of the island, such as Snowdonia or the Lake District. Towards the end of Silurian times this marine trough became silted up and warped, and as compressional forces increased in intensity the whole area with the exception of Devon and Cornwall became land, while farther north the great Caledonian range of mountains was formed. These compressional forces are responsible for the strong slaty cleavage which is found in Wales and the Lake District in the older Palaeozoic rocks and gives

rise to some of the most perfectly cleaved slates in the world.

It was during the elevation of this great mountain chain and while much of England was land that vast amounts of material were worn from the newly formed hills to accumulate in the low-lying elongated basins between the ranges. Thus the Old Red Sandstone with the earliest vertebrates, the fish, was laid down; while to the south, in S. Devon and Cornwall, the sea still remained with its deposits of limestones and shales. In the neighbourhood of the main mountain chain much igneous activity took place, but in England this is restricted to the intrusion of a few granite masses in the Lake District and elsewhere.

Coal Seams Formed.—After the gradual destruction of the land masses by denudation, the sea again invaded the area from the west and deposited extensive beds of Carboniferous Limestone which now form the characteristic scenery of the Pennines, Peak district and Mendip hills. Later these seas were filled up with deltaic and estuarine deposits; and it was on the resulting swampy flats that a luxuriant vegetation grew and accumulated which eventually turned into the coal seams alternating with the sands and muds of the estuaries. The conditions of the crust once more became unstable and another period of mountain-building was initiated, but at this time the main range lay to the south in Brittany with secondary ranges on the line of the Mendip hills and in S. Wales.

The chief result of this uplift together with the residual mountains of the former range in Scotland was the formation of a land with an arid climate, a large intermontane tract deprived of almost all moisture-laden winds; while the western shores of an inland sea reached to the line of the Pennines. In this sea the Magnesian Limestone was laid down; on much of the land surface wind-blown sands and breccias were accumulated, while in other places sheets of highly saline water deposited beds of salt and gypsum. These arid conditions continued to the end of Trias times.

There now followed a long period of comparative quiescence during which the sea invaded the area, probably from the south-east and spread up in a Y-shaped gulf between the high land of Wales and the old rocks of East Anglia bifurcating on the Pennines, one branch running up to the west coast of Scotland and the other to the Yorkshire coast. This Y was broken by cross-bars of greater rigidity than the rest of the trough, so that the deposits thin out both to the margins of the trough and also when traced along its length. The deposits are mostly clays and shallow water limestones full of fossils, showing that the waters supported abundant life. This state of affairs lasted throughout the Jurassic and Lower Cretaceous, and it was not until the beginning of the deposition of the Chalk that any general submergence took place. In this deepening and clear sea the highly characteristic deposit of the Chalk which gives rise to the familiar scenery of the Downs and Chiltern Hills was laid down.

At the end of the Cretaceous period important changes took place in the geography of the British islands and what had been an open sea was uplifted into land, all excepting an area in the south-east of England where Tertiary clays and sands were deposited. At this period the fringe of the great Alpine earth movement reached England, causing the marked folding of the beds in the Isle of Wight and the less marked but equally important folds which located the London basin and Wealden anticline. The whole of England and Wales appears also to have received a slight tilt down to the east about that time, and this occasioned the removal by erosion of most of the western part of the Mesozoic sediments and also much from the Palaeozoic rocks of Wales and the Pennines.

While this was happening, widespread volcanic acivity was taking place in northern Ireland and western Scotland, but the only evidence of a similar occurrence in England is the Cleveland dyke in Yorkshire and possibly some intrusions of doubtful age in the Midlands. The quantity of material which was removed must have been enormous and the land appears to have been worn down to a gradually sloping surface out of which the higher hills rose as residual mountains. In East Anglia the shell-banks of the Pliocene were laid down, during a time when the climate was gradually changing from temperate to arctic, a change that continued, with fluctuations, until the end of the Pliocene when conditions were such that great ice sheets formed and covered most of England and Wales north of a line from the Severn estuary to the Thames.

There is considerable evidence that there were marked advances and retreats of the ice coinciding with marked oscillations of temperature and probably with considerable changes in the relative level of land and sea, but as the oscillations became less the climate gradually approached its present state and geological time merged into the historic period. (W. B. R. K.)

FAUNA AND FLORA

Flora.—The spread of ice to the line of the Thames and Severn during the maximum Pleistocene glaciation, evidently impoverished the flora of the whole country most drastically. If, as seems probable, the land stood higher, it may be that some plants needing a more temperate climate survived on the then coasts, that is, on land now submerged. The sinking of the land after the Ice age, by converting a one-time peninsula into the British archipelago, made the repeopling of the islands incomplete and the species spreading in from the continent become fewer and fewer westwards. Remains of a post-glacial colony of Arctic plants, such as the dwarf-birch, have been found near Teignmouth, and patches of Arctic-Alpine flora still survive in Scotland and North Wales, on high ground. It is now generally agreed that while the glaciers of north-west Europe were retreating, steppe conditions prevailed widely, and there are plants on sandy soils in Norfolk that may be relics of these conditions; they do not occur in the wetter west. The steppe period of the Upper Palaeolithic age was followed by land-sinking and the spread of Atlantic climate, with growth of forest as a result.

It has been proved that pines, especially *Pinus sylvestris*, were widely distributed, and many remains of this tree occur in the submerged forests off the west coasts, as well as in the peats of the high lands, while what seem to be survivals of very ancient pine forests, with junipers, etc., still grow in north-east Scotland. The west of Ireland has some special plants, such as *Saxifraga umbrosa* (London pride), *S. hirsuta*, *S. geum*, *Erica mediterranea*, *E. Mackaii*, *Daboecia polifolia* (St. Dabeoc's heath), and *Arbutus Unedo* (strawberry tree). The south-west of England has *Erica ciliaris*, *E. vagans*, *Lobelia urens* and a few other plants which seem to belong to the same association. Several species are common to south-west England and southern Ireland, and hardly occur elsewhere. Forbes interpreted this flora as a survival of a pre-glacial flora, but Clement Reid urged that it must be a post-glacial immigration, in view of the arctic condition which must have prevailed over the whole of the present area of the British Isles. The apparent conflict of view would be greatly diminished if it could be established that during glaciation the land lay higher, as this would make it probable that there were plants of the then south-west coasts of Europe which might well have maintained their coastal position as the coastline receded, and thus have established themselves in west and south Ireland and south-west England. Praeger has well named this flora the south-west European. The pennywort (*Cotyledon umbilicus*), not strictly included in the above group, is characteristic of walls and some stony hedges of the south and west of England.

The Forest period was probably beginning in the west when East Anglia was still under steppe conditions. There are two forest beds along various parts of the coast related to movements of land levels as well as to changes of climate, but this is a matter for geological and archaeological argument. The great development of forest spread trees to far higher levels than they occupy at the present time; their remains have been found by Lewis at a height of 2,600 ft. on Cross Fell. The lowland and the drier uplands grew oak forest (including the large oak *Quercus robur*), while the non-calcareous soils of the western hills were clothed with the smaller *Quercus sessiliflora*. It has been estimated that they grew up to levels exceeding their present limits by over 300 feet. The birch still grows above the upper limit of the oak. The beech has existed in Britain since early prehistoric times, though its invasion of Denmark was probably not long before the

beginning of the last millenium B.C. It is highly characteristic of soil-covered slopes on the chalk hills, and it is often accompanied by the yew. Ash forests are specially important in limestone areas. Beech forests degenerate into scrub, and may even become grassland, as on parts of the chalk.

The wide extension of woodland in the period following post-glacial land sinking, had considerable effect in limiting the sites of human occupation, but though Fox has shown in special detail that man reduced the forest, especially after Roman times in England, it is doubtful whether the reduction of the forest should be ascribed entirely to the efforts of man. The reduction of its upper limit on the hills might be sheer denudation or wastage due to sheep and goats, but its universality suggests rather a reduction of temperature, which is also a possible cause of the invasion of forests by peat bogs. It has been shown that, whereas in the heyday of the Swiss lake villages the water-level lay very low, the lake-dwellers civilization was brought to an end by the cooling of the climate and the increase in the volume of the lakes. The invasion of forest by peat bog in Scandinavia, the invasion of the previous oak forests of Denmark by the beech, which can stand less heat, all point to a climatic change 1000 B.C., and evidence is being gathered for this from the Mediterranean region as well. At the same time it should be remembered that a beech wood, for example, accumulates acid humus in its soil, and so makes that soil unfavourable, in the long run, to renewal of the trees as they die. In some parts of the British Isles peat bogs are decaying; in others they are stable; in others again they are growing at the present time. The gorse or yellow whin (*Ulex europaeus*) is one of the most characteristic plants of Britain.

The cultivation of wheat in England finds highly suitable soil in the east, but the climate in many parts makes the harvest risky; there may be an occasional drought; there is far more often an excess of rain when the ears are ripening. Wheat is most largely grown in the south-east of the country, but the amount is diminishing. Oats, more tolerant of rain, ripen more assuredly, and it is noteworthy that the English oats-harvest is before the wheat-harvest, whereas in Poland the order is reversed. Barley is grown in many different areas. Hops are grown in large quantities in Kent, and also on the Hereford plain. Beet-sugar is being established in East Anglia, Salop, Somerset, etc. Fruit orchards of apples, plums and cherries are important in Herefordshire, Gloucestershire, Worcestershire, Somerset, Devon, etc. Kent is well named the garden of England.

Fauna.—The wild fauna of Britain is characterized by its poverty, which arises from its devastation in the Ice age, its conversion into an island as the climate was becoming temperate once more, and its density of human population. The wolf probably disappeared from England before Tudor times, the wild boar and beaver have also gone within historic times. The pure wild cattle have vanished, but their blood has influenced the races of domestic cattle in Britain. Red deer and roe deer and fox owe their preservation to the huntsmen of the country. The pine marten still occurs now and then, and the polecat is found in some localities still; the badger and hare are of some importance, as are the stoat and weasel. The so-called brown rat has largely displaced an older-established smaller black race. The rabbit, a mediaeval introduction, has spread far and wide.

Many of the birds that used to visit England in the breeding season come no longer. The draining of the Fens in eastern England has curtailed the breeding ground of many of the warblers, the crane and the bittern. The only peculiar British species, the red grouse (*Lagopus scoticus*), occurs in the northern counties, while the introduced pheasant is widely distributed. The most numerous bird is probably the meadow pipit, the most familiar the house sparrow.

Particular interest attaches to certain species of fresh water fishes, especially the salmon and trout, as they react both in pigment and form to different environments, and there are thus many local peculiarities. Some fish (char, etc.) of the lakes of Westmorland and Cumberland are of interest in that they probably represent an old group, related to the trout, that formerly migrated to the sea, but with the tectonic changes that formed these lakes, their outlets were cut off. All that need be said of the invertebrates is that there exists in England no species not found on the Continent, while some of the invertebrates offer the best examples of the Continental origin of our fauna.

PEOPLE AND SETTLEMENTS

The subject of early immigrations into Britain can be followed, in outline, in the section of ethnology in the article EUROPE, and some of the archaeological correlations can be studied in article ARCHAEOLOGY. Here it must suffice to say that the old notion of a purely savage Britain civilized by Roman conquerors seems to be fading away. The persistence of features of older organization in Roman times is a noteworthy fact in several parts of south Britain. The much debated problem of the relations of Anglo-Saxon invaders to pre-existing populations is still very difficult to follow to any reasonable conclusion, but it is often argued that the very large amount of medium and dark brown hair in British populations is a sign of survival of pre-Saxon elements, and we note the fact that there are numerous nests of dark types, apart from the Celtic fringe, notably in the Chilterns.

Early Settlement.—The view is often held, but sometimes disputed, that settlements in lowland villages in England began in Anglo-Saxon times, and introduced the system of common arable land held in strips, and cultivated on a two-field (one field each year), or a three-field (one field winter corn, one spring corn and one fallow) scheme. Leeds has recently brought forward evidence to suggest that there were valley villages on the gravelly patches near certain rivers in the Bronze age, the cultivation scheme of which is quite unknown, while Crawford's air surveys have revealed a scheme of hamlets high on the downs, with small enclosed fields, a system of cultivation presumably dating from the Early Iron age. The lynchets of the Downs are another old scheme of cultivation probably linked with definitive settlement. Whatever may be the facts about pre-Roman settlement, there can be no doubt that it utilized mainly the land that was not densely wooded, and that the post-Roman centuries in Britain, as in central Europe, saw a great extension of lowland rural settlement above water meadows and in woodland clearings. Nor is there any doubt that the villages thus arising utilized the two-field, and probably the three-field, system of cultivation, whatever may be the truth as to the origin of such systems.

The fair, tall, long-headed element in the British population was probably strengthened by Viking and Danish invasions, and the study of place names organized recently by Allen Mawer, will throw further light, it is hoped, on the distribution of these populations; it appears that the abundance of Scandinavian names around the Solway firth, and in Cumberland and Lancashire, indicates an influence that had much to do with the definitive isolation of Celtic-speaking elements in Strathclyde from Celtic-speaking peoples in Wales. It seems clear that at this period the Celtic-speaking inhabitants were still under tribal organization, with the homesteads of the herdsmen on the hill sides, and probably with the custom of moving up to the hill pastures in summer.

Norman Period.—The Norman period witnessed a considerable extension of rural settlement along with the growth of manors, and the regions which were once, or are still in some cases, rich in parish churches of Romanesque (Norman) architecture, might be mapped to give clues to the spread of population. At the same time there was urban and commercial growth followed by the establishment of bishops' sees in regional capitals, especially such as had communication by water with the Continent. The placing of bishops at Lincoln, Norwich and Exeter is typical here. At the same time comes the rise of Bristol in connection with trade to Ireland, where Dublin became for a while a dependency of Bristol. An estimate of the population of England at the time of the Domesday survey makes the total 1,500,000, and, especially after a measure of order had been established under Henry II., and a further measure under Edward I., it seems to have grown, for estimates of the total just before the Black Death (1348–49) give totals varying from 2,500,000 upwards. The tendency to specialize in wool seems to have been

SEASIDE AND RURAL TOWNS OF ENGLAND

1. View of Torquay, Devon, a popular watering-place and health resort. It is situated on seven hills rising above Tor Bay at the convergence of two valleys. The town is protected from all winds except those from the south and the temperature range is about 30°–75°
2. The old market town of Ross, Herefordshire, from the River Wye. The river was at one time the boundary between the Saxons and the Welsh. The most prominent building in the town is the Decorated and Perpendicular church, the spire of which is shown at the right
3. Clovelly, a herring-fishing village, situated in a rift in the cliffs on the shore of the Bristol channel. The main street descends in steps and stages from a height of 400 ft. to the little cove and pier. No two of the whitewashed houses are on the same level
4. Lynmouth, a summer resort on the shore of the Bristol channel at the point where the valleys of the East and West Lyn converge. Its twin village, Lynton, is situated on a cliff 430 ft. above Lynmouth. These two villages have literary associations of interest; Shelley and his wife Harriet Westbrook lived here at one time, and Southey, who visited the villages, wrote a famous description of them
5. Airplane view of Blackpool, on the Irish Sea, a popular seaside resort of England. It is crowded in summer by excursionists from all parts of the industrial North and the Midlands. In the left foreground of the picture is a view of the big enclosed pool
6. Robin Hood's Bay, and Bay Town, on the Yorkshire coast, a fishing-village built on a steep slope at the north end of the bay

promoted by shortage of labour due to the Black Death, and the claim has been made that the Cistercians had, prior to this, done a good deal to foster the wool trade. Some manors fell into decay, owing both to loss of population and to the spread of sheep-farming and, with the decay of manorial restrictions and the rise of wool trade, movement began to be a little freer, and money payments began to take the place of dues in service. With the rise of the wool trade came the enclosure of common lands, sometimes old arable, more often old woodland and hill pasture, with the result that population and the wool trade grew in several areas such as the Cotswolds. It is interesting to note that, at the Reformation, bishoprics of Chester, Gloucester, Oxford and Peterborough were created; this seems to mark a considerable inland development in England.

Tudor, Stuart and Hanoverian Periods.—The Age of Discovery changed England from a land at the edge of the known world, to a collection of harbours in the centre of the land hemisphere and at a prime focus of maritime routes. Devon sea-dogs spread Britain's power at the expense of that of Spain. London began to function on a new scale in relation to the Continent; trade with the Indies and with the new populations of Anglo-Saxon America was added. The spread of root crops increased stock-raising possibilities and, by interfering with the right of stubble-pasture, weakened the agricultural village communities. The little regional centres, county-towns and the like, had a period of development following agricultural improvement and consequent growth of markets, and many towns show this in their fine 18th century houses, so well seen at Shrewsbury and Ludlow. These towns became social centres of some importance so long as roads were not good enough to draw people to London from more distant districts. Up to this time the population was dense on the south-eastern plains of England and sparse in the west and north, denser where there was more cultivation or more woollen manufacturing, sparser where there was more woodland and hunting and where stock-raising was the characteristic rural activity. The region of denser, more commercial population was, in the main, Roundhead in the 17th century struggles, the region where it was sparser was, on the whole, Royalist. From the 16th to the 18th century England received a new influx of people, not in large numbers but of great energy and initiative, mainly religious refugees from France and Flanders, who caused the woollen manufactures to grow enormously, brought commercial experience, and a power of criticism in both religion and politics. Their influence and that of their descendants on the subsequent growth of British towns and industries has been a very great one.

The population at the various decades was:—

Date	Population	Decennial rate of increase per cent
1801	8,892,536	..
1811	10,164,256	14·00
1821	12,000,236	18·06
1831	13,896,797	15·80
1841	15,914,148	14·27
1851	17,927,609	12·65
1861	20,066,224	11·90
1871	22,712,266	13·21
1881	25,974,439	14·36
1891	29,002,525	11·65
1901	32,527,843	12·17
1911	36,070,492	10·89
1921*	37,886,699	..

*The World War of 1914–18 makes the figure for 1911–21 of no value for comparisons.

The Industrial Revolution.—Coal had been used domestically in the middle ages, and it had been exported from Newcastle-on-Tyne, Swansea, etc. In the 19th century it was applied on a large scale, at first in Staffordshire for iron work, then for iron smelting, and then for steam machinery of all kinds, with the result that there was an enormous and rapid growth of new centres of population where the coal was dug, usually in regions that had previously been old-fashioned and sparsely peopled. The rapid growth of clusters of very large towns in previously out-of-the-way areas is a feature that makes English industrial development very different from that of Germany, where Cologne, Düsseldorf, Leipzig, Nürnberg and many another industrial city has been great and famous for centuries. Invention followed invention, population on the coal fields grew, and the British markets were opened freely to foreign corn to feed the masses that industrialism had called into existence; cultivation and rural population entered upon a period of decline in the second half of the 19th century, with a resultant drift to the poor quarters of the ill-planned towns of mushroom growth. The smoke and grime of coal pits, and transport of crude coal has added to the squalor of many of the industrial agglomerates of Britain, and a characteristic reaction of the last generation has been the Town and Regional Planning movement, which has owed much of its inspiration to the Society of Friends and to Ebenezer Howard and Patrick Geddes. There is still serious overcrowding and bad housing in many centres, notably in Northumberland and Durham.

In 1921 the distribution on a county basis in England was:—

English counties	Area, 1921 (acres, land and water) counties including county boroughs	Population including county boroughs
Bedfordshire	302,942	206,588
Berkshire	463,834	294,794

(Those in italics are not complete counties.)

Population and Vital Statistics.—Thus, during the 19th century, the face of England was changed. Regions of relatively dense population in 1800 (excluding London) were regions of

relatively sparse population by 1900, less because of local decline than because of immense growth in the coal fields. The present (1921) distribution shows five great centres of dense population —south Lancashire, of which Manchester and Liverpool are the centres; Northumberland, with Newcastle as focus; the West Riding of Yorkshire around Leeds and Sheffield; the Midlands, with Birmingham as centre; and the region of Greater London. During the century the population of England and Wales had increased from 8,750,000 to 32,500,000. The total population had reached 37,750,000 in 1921.

The towns with a population (1921) over 100,000 were:—

	Area in acres (1921)	Census population
Birkenhead (C.B.)	3,909	145,577
Birmingham, City of (C.B.)	43,601	919,444
Blackburn (C.B.)	7,420	126,643
Bolton (C.B.)	15,280	178,683
Bradford, City of (C.B.)	22,881	285,961
Brighton (C.B.)	2,545	142,430
Bristol, City of (C.B.)	18,436	376,975
Burnley (C.B.)	4,620	103,157
Coventry, City of (C.B.)	4,147	128,157
Croydon (C.B.)	9,012	190,684
Derby (C.B.)	5,272	129,796
East Ham (C.B.)	3,324	143,246
Gateshead (C.B.)	3,132	125,142

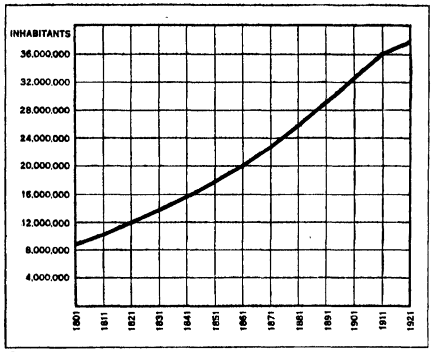
Wolverhampton (C.B.)	3,525	102,342

(C.B.) = County Borough.

A town with a population of over 50,000 may become a county borough. All towns over 50,000 are not, however, county boroughs, while four towns with small populations, according to present standards, were created county boroughs for other reasons long ago, and still retain the name, though not all the distinctive organization. They are Carmarthen and Haverfordwest in South Wales, Poole and Lichfield in England.

Of the 38 towns listed above, 26 belong to the industrial north and the Black Country area of the Midlands, while three more, Bristol, Leicester and Nottingham, also owe their great growth in considerable measure to coal in their neighbourhoods, and another five are units dependent on London. This leaves the non-coal area with only four cities of this size, apart from the places which are extensions of the metropolis, and three of the four are modern ports; Portsmouth, the naval centre, and Southampton and Plymouth. Norwich is thus, in a sense, alone in this class as an old centre which has maintained itself without coal or steamship traffic. The change of distribution of population following the rise of industry is thus dramatically demonstrated.

An outstanding feature of the English population, as contrasted, for example, with that of France, is the discontinuity in social and economic development of the former. The enclosure of common lands, as a long-continued change, culminated in the general Enclosures Act of 1845. This movement broke up the traditional village organization and, incidentally, converted a former peasantry into landless labourers, who often drifted to industrial and mining centres, and sometimes became squatters on the heaths and waste lands. By 1875 means of overseas transport had improved sufficiently, and the populations of far-off lands had grown sufficiently, to flood the British market with foreign-grown wheat at rates below those at which it could be produced



GRAPH SHOWING GROWTH OF POPULATION IN ENGLAND AND WALES FROM 1801–1921. IN 1921 THERE WERE 109.6 FEMALES TO 100 MALES

in England, in which country the wheat harvest is particularly dependent on the weather. From 1875 onward more rural workers, and especially the abler youths among their children, migrated to the large towns or emigrated abroad, and the enormous growth of industry drew immigrants from Ireland and the Clyde and Wales, the immigrants usually taking up activities arising out of their previous experience in some way. There seems little doubt that this vast redistribution of population has altered, not only the location, but the proportions of the types of the population. The old-established British stock, marked by dark hair, long head and moderate stature, appears better able than others to withstand crowding and factory conditions, provided that it gets a sufficient quantity of food, and the immigrants into industrial areas included large numbers of this type, while the fair, stalwart type has apparently been streaming off to the new lands pioneering, just as it came pioneering to Britain centuries ago. The growth of towns is illustrated by the fact that, in England and Wales, only 23% of the population was rural in 1901, and the proportion had gone down to 20·7% in 1921. In France, on the other hand, the proportion of rural population in 1911 was nearly 59%; it is doubtless lower now, but satisfactory estimates would be difficult to make in a period of transition and reconstruction such as that which is just closing. In Germany, the proportion of the population living in agglomerations of over 2,000 inhabitants each was estimated for 1919 at 62·5%, giving a rural population of 37·5%; it was claimed that the cities were becoming stabilized and that immigration of rural workers into the towns was not likely to continue on a large scale.

Vital Statistics.—The birth rate and the death rate in England, as well as in the British Isles, in general, are diminishing. The birth rate rose during the 19th century until, between 1870–75, it was 35·5 per 1,000 of the population. Since that date it has fallen steadily; in 1927 it was calculated at 16·6. The fall in the death rate has not been quite so marked. It was about 23 per 1,000 of the population about 1845, and had fallen to about 12 per 1,000 in 1921. When we remember that, late in the 18th century, mortality of infants under the age of five was as high as 75% of the births, and has been reduced at the present time to about 5%, we realize the triumph of medical science and social and hygienic improvements. The birth rate minus death rate figures have come down very considerably during the present century,

which suggests that the population is moving towards stability. In 1928 the population was still actually increasing, but the rate of increase is growing less and less. Recent calculations (*see* Sir C. F. Close, "Population and Migration," *Geography*, vol. xiv.) seem to indicate that the effect of the war of 1914–18 was very marked and that the population is at least 2,000,000 less than it would have been if there had been no war.

In 1927 there were 1,041 male to 1,000 female births. This ratio has now become approximately what it was before 1914. During 1914–18, and for some time afterwards, the proportion of male births was abnormally high. Infantile mortality is, however, greater among males, and the general population has an excess of females at almost all ages, an excess which increases for adult life. The proportion of females is usually highest in residential districts with considerable domestic staffs; it is lowest in mining areas, though this would probably be more true of newly-developing regions than of those that have become more stabilized.

The marriage rate of the population (adults, aged 20 and upwards) was 14·2 per 1,000 in 1886, and 16·5 per 1,000 in 1899. In 1927 it was 15·7 per 1,000. The number of births per 1,000 married women in 1921 was 100. It was 166 per 1,000 in the '70s of last century. (*See* A. M. Carr-Saunders and Caradog Jones, *The Social Structure of England and Wales*, p. 222.)

The number of British emigrants to places outside Europe was 153,505 in 1927. Their destinations were mainly the United States (25,662), British North America (52,916), Australia (40,991), New Zealand (7,841), British South Africa (7,572), India and Ceylon (6,476). These figures are low compared with those previous to the World War. There was a large emigration in 1923, reaching 199,000. The high figure was due to the approaching restrictions on immigration into the United States.

RELIGION

The distribution of adherence to religious organizations in England is difficult to survey in the absence of suitable records. In the religious revolution of the 16th century the English aristocracy in general, and the rural population with them, adhered to the State Church, which was also strongly supported by the wealthier residents in towns, and retained a large following among the poor. Contacts with religious refugees from the Continent, however, and the progress of discussion, developed a large dissenting element, mainly in industrial centres and among the tradesfolk of market towns. This element received a considerable intellectual stimulus from the clergy dispossessed at the time of the Act of Uniformity (1661). From these early dissenting groups there have arisen chiefly the Congregationalists and Baptists, who have their traditional centres in the part of England that was Parliamentarian in the Civil War, and especially in parts of the east Midlands. Some dissenting groups, especially in industrial centres, became Unitarian or related themselves to the Society of Friends, and the Unitarian and Quaker groups of many of the great cities of England have played a part, altogether out of proportion to their numbers, in the economic development and, especially, in the social amelioration of British life. The fact that at the time Birmingham was still governed as a manor and was not a municipality, made it a specially important centre of dissent (*see* BIRMINGHAM). On the other side of the State Church position stood some old families, chiefly of the Welsh border and Lancashire, continuing to adhere to the Roman Catholic Church.

In the 18th century the Methodist movement gained considerable numbers of adherents in the old dissenting centres of the south and east, but had its greatest influence among the miners and heath peoples of the west and north, and the coincidence in time between its spread and the rise of textile industries made it play a great part in shaping opinion in 19th century England.

The 19th century has witnessed the gradual removal of disabilities under which non-members of the State Church formerly lived, and this, among other factors, has helped to bring into the State Church considerable numbers of descendants of dissenting and Methodist families. It has also witnessed a considerable sub-division of the Methodist groups, followed by efforts now apparently approaching a successful issue, to reunite the various bodies in one large Methodist Church. The removal of disabilities has almost ended religious persecution, save for conscientious objectors in war time, and outlying groups such as spiritualist practitioners, whose beliefs or practices bring them into conflict with laws which did not visualize such cases.

In the Church of England the ecclesiastical system is episcopal, and the whole of England is divided into two provinces, Canterbury and York, each with its archbishop. Until the Welsh Church Acts of 1914 and 1919, the whole of Wales was included under Canterbury, but since 1920 Wales has been formed into a separate archbishopric. The archbishoprics are divided into bishoprics, and these are subdivided again into parishes (the smallest ecclesiastical units). The parishes are grouped for certain administrative purposes into rural deaneries. The cathedral churches are governed by chapters, consisting of a dean, canons and prebendaries. The present civil parishes do not coincide with ecclesiastical parishes, which have lost their old significance. Each parish has its church, with its priest who is known as a vicar, rector or perpetual curate, according to his relation to the temporalities of his parish.

Twenty-six bishops have the right to seats in the House of Lords, of whom five, namely, the two archbishops and the bishops of London, Durham and Winchester, always sit, the others taking their seats in order of seniority of consecration.

Under the Church of England Assembly (Powers) Act, 1919, there is a National Assembly called "The Church Assembly" in England, consisting of a house of bishops, a house of clergy, and a house of laymen, which has power to legislate regarding Church matters. Every measure passed by the Church Assembly must be submitted to an ecclesiastical committee nominated by parliament, and this committee reports on each measure which becomes law, if passed by both houses of parliament.

The various Nonconformist Churches generally have a resident minister (pastor) where the churches have large congregations. The smaller congregations are visited periodically by ministers, but otherwise have lay preachers. The Wesleyan Methodist and some other Methodist ministers change circuit periodically, the period in the Wesleyan Methodist Church having formerly been three years. The organization of the Wesleyan Methodist and other Churches is highly developed, government being vested in a conference. The Congregationalist and Baptist Churches have a less elaborate general organization, and have relied more on the principle of self-government of each group. The Presbyterian Church has developed in England on Scottish lines. The Society of Friends occupies a very special position, as fixed dogmas and an ordained ministry are against the principles of the society; though a small group numerically, the influence of the Society upon thought and policy is a great one. The Salvation Army, with a more or less military organization, is a group famed for its work among the less fortunate strata of the community. The Jewish religion numbers about 300,000 adherents, with about 200 synagogues. The removal of restrictions has permitted the Roman Catholic Church to build up afresh its organization in this country, and it has in England (1924) three archbishops, of whom one is a cardinal, 13 bishops and four bishops-auxiliary.

BIBLIOGRAPHY.—The older works which have become classics, especially for descriptive topography, include J. Leland (1506–52), *Itinerary* (1710–12) and *Collectanea* (1715, ed. by J. Hearne); Camden, *Britannia* (1586 and subsequent editions); T. Fuller, *History of the Worthies of England* (1662); D. Defoe, *Tour through the Whole Island of Great Britain* (1724–27); W. Marshall, *General Survey of the Rural Economy of England* (1787–98, 12 vols.), and other works; A. Young, *A Six Weeks' Tour through the Southern Counties* (1768); *A Six Months' Tour through the North of England* (1770); *The Farmer's Tour through the East of England* (1771); *General View of the Agriculture of Suffolk* (1797), *Lincoln* (1799), *Hertfordshire* (1804), *Norfolk* (1804), *Essex* (1807), *Oxfordshire* (1809). A modern general work of reference is the *Victoria History of the Counties of England*, a series in many volumes and still in progress.

ENGLAND, THE CHURCH OF. The Christian Church in England existed as the Church of the English people long before that people became a united nation; and notwithstanding changes of doctrine, ritual and organization, there has been no real breach of continuity from the 6th century onwards. In the present article only the most outstanding and significant facts in the history of the Church of England are described, until we come to the last decade of the 19th century, from which date the course of events is treated more fully.

The British Church.—Christianity reached Britain during the 3rd century, and perhaps earlier, probably from Gaul. An early tradition records the death of a martyr Alban at Verulamium, the present St. Albans. A fully grown British Church existed in the 4th century: bishops of London, York and Lincoln attended the council of Arles in 314; the church assented to the council of Nicaea in 325, and some of its bishops were present at the council of Rimini in 359. Britons made pilgrimages, to Rome and to Palestine, and some joined the monks who gathered round St. Martin, bishop of Tours. Among these was Ninian, who preached to the southern Picts, and about 400 built a church of stone on Wigton Bay; its whiteness struck the people and their name for it is commemorated in the modern name Whithorn. From northern Britain, St. Patrick (*see* PATRICK, ST.) went to accomplish his work as the apostle of Ireland. When the Britons were hard pressed by Saxon invaders large bodies of them found shelter in western Armorica, in a lesser Britain, which gave its name to Brittany. A British Church was founded there, and bishops, scholars and recluses of either Britain seem constantly to have visited the other. Afterward Gildas (about 550) and other British monks preached in Ireland, and from them the Scots, the dominant people of Northern Ireland, received a ritual. The organization of the Scotic Church in Ireland was similar to that of the British Church. Its monastic settlements or schools were many and large, and were the abodes of learning. Bishops dwelt in them and were reverenced for their office, but each was subject to the direction of the abbot and convent. In 565 (?) St. Columba, the founder and head of several Scotic monasteries, left Ireland and founded a monastery in Iona, which afforded gospel teaching to the Scots of Dalriada and the northern Picts, and later did a great work in evangelizing many of the Teutonic conquerors of Britain. But the Anglo-Saxon invasion had cut off Britain from communication with Rome. The British Church had no share in the progressive life of the Roman Church. The Britons themselves gradually retreated before the invaders to Wales, and to western and northern districts, or dwelt among them as slaves or as outlaws, and they made no attempts to evangelize the conquering race.

Foundation of the English Church.—The romantic story of the Roman Abbot Gregory (afterwards Pope Gregory the Great) seeing some fair-haired English boys exposed for sale in Rome, and so being led to take a practical interest in the Christianization of their country, is well known. After he became pope he sent a mission to England headed by Augustine. The way was prepared, for Aethelberht, king of Kent, had married a Christian, a Frankish princess Berhta. Augustine and his band landed probably at Ebbsfleet in 597. They were well received by Aethelberht, who was converted and baptized. On the 16th of November Augustine was consecrated by the archbishop of Arles to be the archbishop of the English, and by Christmas had baptized many hundreds of Kentish men. Augustine restored a Roman church at Canterbury to be the church of his see. Gregory sent directions for the rule of the infant church. There were to be two archbishops, at London and York; London, however, was not fully Christianized for some years, and the primatial see remained at Canterbury. The mission prospered, but its influence depended on the varying fortunes of the Anglo-Saxon kings; and in 30 years only Kent, East Anglia and parts of Northumbria remained Christian.

The work of the Romans was taken up by Scotic missionaries. Oswald, under whom the Northumbrian power revived, had lived as an exile among the Scots, and asked them for a bishop to teach his people. Aidan was sent to him by the monks of Iona in 635, and fixed his see in Lindisfarne, or Holy Island, where he founded a monastery. Saintly, zealous and supported by Oswald's influence, he brought Northumbria generally to accept the gospel. The conversion of the Middle Angles and Mercians, and the reconversion of the East Saxons, were also achieved by Scots or by

COMMERCIAL AND INDUSTRIAL CENTRES

1. View of the docks at Southampton. Among the best equipped in the world, they can accommodate the largest ships afloat. Transatlantic passenger traffic passes largely through this port

2. Docks at Sunderland, Durham, on the North Sea, a base for the export of coal. Shipbuilding is also an important industry here. The iron bridge shown in the centre of the picture, crossing the River Wear, was the most advanced structure of its kind when built, in 1796

3. Preston, Lancashire. Cotton mills and the tenement homes of the workers surrounding them. The photograph shows the congested conditions in which the mill-hands and their families live

4. Clifton, Bristol, showing old tenement houses. It is situated on the gorge of the Avon, which is here crossed by the Clifton suspension bridge. Chains on the bridge once formed part of the London Hungerford bridge

5. General view of Oldham, a Lancashire cotton town with over 300 cotton-spinning mills, and which manufactures a large amount of velvet, silks, sateens and cotton goods

6. Hanley, one of the six towns of "The Potteries," showing mills where pottery is made. An entire district about 10 miles long and ⅔ mile wide is devoted to this industry. Pottery of every description from the artistic to the utilitarian is manufactured

disciples of the Scotic mission. The Scots were admirable missionaries, holy and self-devoted, and building partly on Roman foundations and elsewhere breaking new ground, they and their English disciples, as Ceadda (St. Chad), bishop of the Mercians, and Cuthbert, bishop of Lindisfarne, who were by no means inferior to their teachers, almost completed the conversion of the country. But they practised an excessive asceticism and were apt to abandon their work in order to live as hermits. Great as were the benefits which the English derived from their teaching, its cessation was not altogether a loss, for the church was passing beyond the stage of mission teaching and needed organization.

Its organization like its foundation came from Rome. An archbishop-designate who was sent to Rome for consecration having died there, Pope Vitalian in 668 consecrated Theodore of Tarsus as archbishop of Canterbury. The church had no system of government nor means of legislation. Theodore united it in obedience to himself, instituted national synods and subdivided the overlarge bishoprics. He also gave the church learning by establishing a school at Canterbury, where many gained knowledge of the Scriptures, of Latin and Greek, and other religious and secular subjects. In the north learning was promoted by Benedict Biscop in the sister monasteries which he founded at Wearmouth and Jarrow. There Bede (*q.v.*) received the learning which he imparted to others. In the year of Bede's death, 735, one of his disciples, Ecgbert, bishop of York, became the first archbishop of York, Gregory III. giving him the *pallium*, a vestment which conferred archiepiscopal authority. He established a school or university at York, to which scholars came from the continent. His work as a teacher was carried on by Alcuin (*q.v.*), who later brought learning to the dominions of Charlemagne. The infant church, following the example of the Irish Scots, showed much missionary zeal, and English missionaries founded an organized church in Frisia and laboured on the lower Rhine. Most famous of all, Winfrid, or St. Boniface, the apostle of Germany, with many English helpers preached to the Frisians, Hessians and Thuringians, founded bishoprics and monasteries, became the first archbishop of Mainz, and in 754 was martyred in Frisia. Meanwhile, religion, learning, arts, such as transcription and illumination, flourished in English monasteries; but heathen customs and beliefs lingered on among the people, and in Bede's time there were many pseudo-monasteries where men and women made monasticism a cloak for idleness and vice.

The Danish Invasions.—The invasions of the Danes fell heavily on the church; priests were slaughtered and churches sacked and burnt. Learning disappeared in Northumbria, and things were little better in the south. Bishops fought and fell in battle, the clergy lived as laymen, the monasteries were held by married canons, heathen superstitions and immorality prevailed among the laity. The successful efforts of King Alfred to improve the religious and intellectual condition of his own people (*see* ALFRED), and the gradual reconquest of middle and northern England by his successors, was accompanied by the conversion of the Danish population. A revival of religion was effected by churchmen inspired by the reformed monasticism of France and Flanders, by Odo, archbishop of Canterbury, Oswald, archbishop of York and Dunstan (*see* DUNSTAN). Dunstan sought to reform the church by ecclesiastical and secular legislation, forbidding immorality among laymen, insisting on the duties of the clergy and compelling the payment of tithes and other church dues; but the ecclesiastical revival was short-lived. Renewed Danish invasions, in the course of which Archbishop Alphege was martyred in 1012, and a decline in national character, injuriously affected the church and, though in the reign of Canute it was outwardly prosperous, spirituality and learning decreased. Bishoprics and abbacies were rewards of service to the king, the bishops were worldly-minded, plurality was frequent, and simony not unknown. A political conflict led to the banishment of the Norman archbishop and the appointment of an Englishman, Stigand, in his place. When William of Normandy planned his invasion of England, Alexander II., by the advice of Hildebrand, afterwards Gregory VII., moved doubtless by this schism and by the desire to bring the English Church under the influence of the Cluniac revival and into closer relation with Rome, gave the duke a consecrated banner, and the Norman invasion had something of the character of a holy war.

Norman Times.—The Conqueror's relations with Rome ensured a reform; for the papacy was instinct with the Cluniac spirit. Lanfranc, abbot of Bec, was appointed archbishop of Canterbury and worked harmoniously with the king in bringing the English Church up to the level of the church in Normandy. William and Lanfranc also worked on Hildebrandine lines in separating ecclesiastical from civil administration. Ecclesiastical affairs were regulated in church councils held at the same time as the king's councils. Bishops and archdeacons were no longer to exercise their spiritual jurisdiction in secular courts, as had been the custom, but in ecclesiastical courts and according to canon law. The king, however, ruled church as well as state; Gregory granted him control over episcopal elections, he invested bishops with the crozier and they held their temporalities of him, and he allowed no councils to meet and no business to be done without his licence. Gregory claimed homage from him; but while the king promised the payment of Peter's pence and such obedience as his English predecessors had rendered, he refused homage; he allowed no papal letters to enter the kingdom without his leave, and when an anti-pope was set up, he and Lanfranc treated the question as to which pope should be acknowledged in England as one to be decided by the crown. The relations established by the Conqueror between the crown, the church and the pope, its head and supreme judge, worked well as long as the king and the primate were agreed, but were so complex that trouble necessarily arose when they disagreed. William Rufus quarrelled with Anselm (*q.v.*), who succeeded Lanfranc; and Anselm maintained against Henry I. the papal right of investiture (*q.v.*). This question was settled in England by a compromise: Henry surrendered investiture and kept the right to homage. The substantial gain lay with the crown, for, while elections were theoretically free, the king retained his power over them.

The Angevin Kings.—During Stephen's reign the church grew more powerful than was for the good either of the state or itself. Its courts encroached on the sphere of the lay courts, and further claimed exclusive criminal jurisdiction over all clerks whether in holy or minor orders, with the result that criminous clerks, though degraded by a spiritual court, escaped temporal punishment. Henry II., finding ecclesiastical privileges an obstacle to administrative reform, demanded that the bishops should agree to observe the ancient customs of the realm. These customs were, he asserted, expressed in certain constitutions to which he required their assent at a council at Clarendon in 1164. In spirit they generally maintained the rights of the crown as they existed under the Conqueror. Archbishop Becket (*see* BECKET) agreed, repented and refused his assent; and a long quarrel ensued. The archbishop's murder consequent on the king's hasty words shocked Christendom, and Henry did penance publicly. By agreement with the pope he renounced the Constitutions, but the encroachments of the church courts were slightly checked, and the king's decisive influence on episcopal elections and some other advantages were secured. Under the guidance of ecclesiastics employed as royal ministers, the church supported the crown until, in 1206, Innocent III. refused to confirm the election of a bishop nominated by King John to Canterbury, and consecrated Stephen Langton as archbishop. The resulting quarrel with the pope ended with the king's surrender in 1213, when he acknowledged that he held his kingdom of the Roman see, promised a yearly tribute for England and Ireland, surrendered his crown to the legate, and received it again from him. Langton guided the barons in their demands on the king which were expressed in Magna Carta. The first clause provided, as charters of Henry I. and Stephen had already provided, that the English Church should be "free," adding that it should have freedom of election, which John had promised in 1214. As John's suzerain, Innocent annulled the charter, suspended Langton, and excommunicated the barons in arms against the king. These prerogatives were maintained by the papal legates after the accession of Henry III., until 1221, when Pandulf's departure restored Langton to his rightful position as head in England of the church. Reforms in discipline and clerical work were

then carried out. Religious life was quickened by the coming of the friars (*see* FRIARS). Parochial organization was strengthened by the institution of vicars in benefices held by religious bodies. It was a time of intellectual activity, in character rather cosmopolitan than national. English clerks studied philosophy and theology at Paris or law at Bologna; some remained abroad and were famous as scholars, others like Archbishop Langton and Bishop Grosseteste returned to be rulers of the church, and others like Roger Bacon to continue their studies in England. The schools of Oxford had already attained repute, and Cambridge began to be known as a place of study. The spirit of the age found expression in art, and English Gothic architecture, though originally, like the learning of the time, imported from France, took a line of its own and reached its climax at this period. Henry's gratitude for the benefits which in his early years he received from Rome was shown later in subservience to papal demands; but the state of the national church was noted by the Provisions of Oxford in 1258 as part of the general misgovernment which the baronial opposition sought to remedy. The alliance between the crown and the papacy in this reign diminished the liberties of the church.

The 13th, 14th and 15th Centuries.—Edward I., who was a strong king, checked an attempt to magnify the spiritual authority by the writ *Circumspecte agatis,* which defined the sphere of the ecclesiastical courts, put a restraint on religious endowments by the Statute of Mortmain, and desiring that every estate in the realm should have a share in public burdens and counsels, caused the beneficed clergy to be summoned to send proctors to parliament. The clergy preferred to make their grants in their own convocations, and so lost the position offered to them. The king's dealings with the church were on the whole statesmanlike. He employed clerical ministers and paid them by church preferments, but his nominations to bishoprics did not always receive papal confirmation which had become recognized as essential. His weak son Edward II. yielded readily to papal demands. The majority of the bishops in his reign, and specially those engaged in politics, were unworthy men; religion was at a low ebb; plurality and nonresidence were common. Moreover the residence of the popes at Avignon from 1308 to 1377 brought them under French influence; and Englishmen during the war with France were specially displeased that large sums should be drawn from the kingdom for them and that they should exercise ecclesiastical patronage in England. Papal interference in suits concerning temporalities was checked by a law of 1353 (the first statute of *Praemunire*), which made punishable by outlawry and forfeiture the carrying before a foreign tribunal of causes cognizable by English courts. This measure was extended in 1365, and in 1393 by the great statute of *Praemunire*. Indignant at this, Urban V. demanded payment of the tribute promised by John, which was then thirty-three years in arrear, but parliament repudiated the claim.

The Black Death disorganized the church by thinning the ranks of the clergy, who did their duty manfully during the plague. Large though insufficient numbers were instituted to benefices and unfit persons received holy orders. The value of livings decreased and many lay vacant. Some incumbents deserted their parishes to take stipendiary work in towns or secular employments, and unbeneficed clergy demanded higher stipends. Greediness infected the church in common with society at large. The state needed money and attacks were made in parliament on the wealth of the church. A definitely anti-clerical party formed itself, with John of Gaunt, duke of Lancaster, at its head. For political reasons he supported John Wycliffe; but he was unpopular, and when the bishops cited Wycliffe before them in St. Paul's, the duke's conduct provoked a riot and the proceedings ended abruptly (*see* WYCLIFFE). Wycliffe held that temporal power belonged only to laymen; and not to popes nor priests; and he even attacked the papacy itself, which in 1378 was distracted by the great schism; and afterwards condemned pilgrimages, secret confession and masses for the dead. He taught that Holy Scripture was the only source of religious truth, to the exclusion of church authority and tradition, and he and his followers made the first complete English version of the Bible. His opinions were spread by the poor priests whom he sent out to preach and by his English tracts.

With the accession of the Lancastrian house the crown allied itself with the church, and the bishops adopted a repressive policy towards the Lollards. In 1401 a statute, *De heretico comburendo,* ordered that heretics convicted in a spiritual court should be committed to the secular arm and publicly burned, and, while this statute was pending, one Sawtre was burned as a relapsed heretic. Henry V. was zealous for orthodoxy and the persecution of Lollards increased, although the movement had ceased to have any political importance and the church itself was in an unsatisfactory state. As regards the papacy, the crown generally maintained the position taken up in the previous century, but its policy was fitful, and the custom of allowing bishops who were made cardinals to retain their sees strengthened papal influence. The bishops were largely engaged in secular business; there was much plurality, and cathedral and collegiate churches were frequently left to inferior officers whose lives were unclerical. The clergy were numerous and drawn from all classes, and humble birth did not debar a man from attaining the highest positions in the church. Preaching was rare, partly from neglectfulness and partly because, in 1401, in order to prevent the spread of heresy, priests were forbidden to preach without a licence. Monasticism had declined. Papal indulgences and relics were hawked about chiefly by friars. On the other hand, all education was carried on by the clergy, and religion entered largely into the daily life of the people, into their gild-meetings, mystery-plays, and holidays, as well as into the great events of family life—baptisms, marriages and deaths. Many stately churches were built in the prevailing Perpendicular style, often by efforts in which all classes shared.

The Reformation Era.—During the earlier years of the 16th century Lollardism still existed among the lower classes in towns, and was rife here and there in country districts. Persecution went on and martyrdoms are recorded. The old grievances concerning ecclesiastical exactions remained unabated. Lutheranism affected England chiefly through the surreptitious importation of Tyndale's New Testament and "heretical" books. In 1521 Henry VIII. wrote a book against Luther in which he maintained the papal authority, and was rewarded by Leo X. with the title of Defender of the Faith. Henry, however, whose will was to himself as the oracles of God, finding that the pope opposed his intended divorce from Catherine of Aragon, determined to allow no supremacy in his realm save his own. He carried out his ecclesiastical policy by parliamentary help. Parliament was packed, and was skilfully managed; and he had on his side the popular impatience of ecclesiastical abuses, a new feeling of national pride which would brook no foreign interference, the old desire of the laity to lighten their own burdens by the wealth of the church, and a growing inclination to question or reject sacerdotal authority. He used these advantages to forward his policy, and when he met with opposition, enforced his will as a despot. The parliament of 1529 lasted until 1536; it broke the bonds of Rome, established royal supremacy over the English Church, and effected a redistribution of national wealth at the expense of the clergy. Appeals to Rome were forbidden by statute, and the council ordained that the pope should thenceforth only be spoken of as bishop of Rome, as not having authority in England. In 1534 all payments to Rome were forbidden, and it was enacted that, on receiving royal licence to elect, cathedral chapters must elect bishops nominated by the king. The papal power was extirpated by statute, parliament at the same time declaring that neither the king nor kingdom would vary from the "Catholic faith of Christendom." The submission of the clergy was made law; appeals from the archbishops' courts were to be made to the king in chancery, and to be heard by royal commissioners appointed for the purpose; and the king's title as "Supreme Head in earth of the Church of England" was declared by parliament without qualification. Fisher, bishop of Rochester, and Sir Thomas More, lately chancellor, the two most eminent Englishmen, were beheaded in 1535 on an accusation of attempting to deprive the king of this title.

By breaking the bonds of Rome Henry did not give the church freedom; he substituted a single despotism for the dual authority which pope and king had previously exercised over it. In 1535

Cromwell, the king's vicar-general, began a visitation of the monasteries. The reports (*comperta*) of his commissioners having been delivered to the king and communicated to parliament in 1536, parliament declared the smaller monasteries corrupt, and granted the king all of less value than £200 a year. A rebellion in Lincolnshire and another in the north, the formidable Pilgrimage of Grace, followed. The suppression of the greater houses was effected gradually, surrenders were obtained by pressure, and three abbots who were reluctant to give up the possessions of their convents for confiscation were hanged. Monastic shrines and treasuries were sacked and the spoil sent to the king, to whom parliament granted all the houses, their lands and possessions. Some of the wealth was used for the bishoprics of Westminster, Bristol, Chester, Gloucester, Oxford and Peterborough.

The publication of the "Ten Articles" (1536), the "Bishop Book" (1537), the "Six Articles" (1539) and the "King's Book" (1543), showed that Henry, while changing many things in the church, would not allow any deviation in essentials from the religion of Catholic Europe, which was not then so dogmatically defined as it was later by the council of Trent. Edward VI. was a child, and the Protector Somerset and the council favoured further changes, which were carried out with Cranmer's help. Many German reformers came to England, were favoured by the council, and gained influence over Cranmer. The first Book of Common Prayer was authorized by an Act of Uniformity in 1549; it retained much from old service books, but the communion office is Lutheran in character. It excited discontent, and a serious insurrection broke out in the West. After Somerset's fall the government rapidly pushed forward reformation. Altars were destroyed and tables substituted. Five bishops, Bonner of London, Gardiner of Winchester, and Heath of Worcester, then already in prison, and two others, were deprived. Under the influence of the Swiss reformers, who took a lower view of the Eucharist than the Lutheran divines, Cranmer soon advanced beyond the prayer-book of 1549. A second prayer-book, departing further from the old order, appeared in 1552, and without being accepted by convocation was enforced by another Act of Uniformity, and in 1553 a catechism and forty-two articles of religion were authorized by Edward for subscription by the clergy, though not laid before convocation. Edward died in 1553. Apart from matters of faith, the church had fared ill under a royal supremacy exercised by self-seeking nobles in the name of the boy-king. Convocation lost all authority and bishops were treated as state officials liable to deprivation for disobedience to the council. Means of worship were diminished, and the poor were shamefully wronged by the suppression of chantries, gilds and holy day; even the few sheep of the poor brethren of a gild were seized to swell a sum which from 1550 was largely diverted from public purposes to private gain. Churches were despoiled of their plate; the old bishops were forced, the new more easily persuaded, to give up lands belonging to their sees.

When Mary succeeded her brother, the deprived bishops were restored, some reforming bishops were imprisoned, and Cranmer, who was implicated in the plot on behalf of Lady Jane Grey, was attainted of treason. As regards doctrine, religious practices and papal supremacy, Mary was set on bringing back her realm to the position existing before her father's quarrel with Rome. Her first parliament repealed the ecclesiastical legislation of Edward's reign, and convocation formally accepted transubstantiation. Cardinal Pole was received as legate, and the title of Supreme Head of the Church having been dropped, a parliament carefully packed, and the fears of the rich appeased by the assurance that they would not have to surrender the monastic lands, he absolved the nation in parliament and reunited it to the Church of Rome on November 30, 1554, the clergy being absolved in convocation. Parliament repealed all acts against the Roman see since the twentieth year of Henry VIII. The heresy laws were revived, and a horrible persecution of those who refused to disown the doctrines of the prayer-book began in 1555, and lasted during the remainder of the reign. Nearly 300 persons were burned to death as heretics in these four years, among them being five bishops: Hooper of Gloucester, Ferrar of St. David's, Ridley of London, and Latimer (until 1539) of Worcester in 1555, and Archbishop Cranmer in 1556. The chief responsibility for these horrors rests with the queen. Mary died in 1558. Her reign arrested the rapid spoliation of the church, but the persecution by which it was disgraced made another acceptance of Roman supremacy impossible.

Elizabethan Settlement.—Elizabeth's accession was hailed with pleasure; she was known to dislike her sister's ecclesiastical policy, and a change was expected. An Act of Supremacy restored to the crown the authority over the church held by Henry VIII., and provided for its exercise by commissioners, whence came the Court of High Commission nominated by the crown, as a high ecclesiastical court. An Act of Uniformity prescribed the use of the prayer-book of 1552 in a revised form which raised the level of its doctrine, and injunctions enforced by a royal visitation re-established the reformed order. Adherents to Rome vainly tried to obtain papal sanction for attending the church services, and were forced either to disobey the pope or become "recusants"; many were fined, and those who attended mass were imprisoned. Meanwhile a party, soon known as Puritans, rebelled against the prescribed church order; exiles who had come under Genevan influence objecting on their return to vestments and ceremonies enjoined by the prayer-book. There was much non-conformity in the church which the queen ordered the bishops to correct. Meanwhile the pope endeavoured to involve the English Catholics in political rebellion. Active opposition to the government was stirred up by Pius V., and in 1569 a rebellion in the north, where the old religion was strong, was aided by papal money and encouraged by hopes of Spanish intervention. In 1570 Pius published a bull excommunicating and deposing the queen. Thenceforward recusants had to choose between loyalty to the queen and loyalty to the pope. They lay under suspicion, and severe penal laws were enacted against Romish practices. About 1579 many seminary priests and Jesuits came over to England as missionaries; some actively engaged in treason, all were legally traitors. The council hunted down these priests and their abettors, and many were executed. The papal policy defeated itself; a large number of the old religion while retaining their faith chose to be loyal to the queen.

In the meantime the doctrine of the church was officially set forth in the revised articles of religion which appeared as the XXXIX. Articles in 1576; and from this time began the non-conformist effort to introduce Presbyterianism. Cause for grievance existed in the state of the church which had suffered from the late violent changes. Separation, or Independency, began about 1578 with the followers of Robert Browne, who repudiated the queen's ecclesiastical authority (*see* CONGREGATIONALISM); but many nonconformists remained in the church and continued their efforts to subvert its episcopal system. Elizabeth understood the political value of the church, and would allow no slackness in enforcing conformity. Archbishop Whitgift, though kind-hearted, was strict in his administration of the law; and his firmness met with success. The church regained a measure of orderliness and vigour; its claims on allegiance were advocated by eminent divines and expounded by Hooker. The queen died in 1603.

The Puritan Rebellion.—On the accession of James I. the Puritans expressed their desire for ecclesiastical change in the Millenary Petition which purported to come from 1,000 clergy. At a conference between divines of the two parties at Hampton Court in 1604, James roughly decided against the Puritans. Some small alterations were made in the prayer-book, and a new version of the Bible was undertaken, which appeared in 1611 as the "authorized version." Although conformity could be enforced, the Puritan party grew in strength partly from religious and partly from political causes. They would not admit any authority in religion that was not based on the scriptures; their opponents maintained that the church had authority to ordain ceremonies not contrary to the scriptures. The bishops derived their support from the king, and the church in return supported the king's claim to absolutism and divine right. It suffered heavily from this alliance. As men saw the church on the side of absolutism, Puritanism grew strong both among the country gentry, who were largely represented in the Commons, and among the nation at large, and the church lost ground through the king's political errors. Many of the changes introduced by Laud after he became archbishop in

1633 were needful. Their purpose was partly to restore order and decency in worship; but the introduction of more ceremonial offended the Puritans and was enforced in a harsh and tyrannical manner. Laud lacked wisdom and sympathy. Under his rule nonconforming clergy were deprived and sometimes imprisoned. The cruel punishments inflicted by the Court of Star Chamber of which he was a member, his own harsh dealing, and the part which he took in politics as a confidential adviser of the king, combined to bring odium upon him and upon the ecclesiastical system which he represented. A storm of discontent with the course of affairs both in church and state gathered. In 1640 Charles, after dissolving parliament, prolonged the session of convocation, which issued canons magnifying the royal authority. The Long Parliament voted the canons illegal; Laud was imprisoned, and in 1642 the bishops were excluded from parliament. The civil war began in 1642; in 1643 a bill was passed for the taking away of episcopacy, in 1645 Laud was beheaded, and parliament abolished the prayer-book and accepted the Presbyterian directory, and from 1646 Presbyterianism was the legal form of church government. The king, who was beheaded in 1649, might have extricated himself from his difficulties if he had consented to the overthrow of episcopacy. The victory of the army over parliament secured England against the tyranny of Presbyterianism, but did not better the condition of the episcopal clergy; the toleration insisted on by the Independents did not extend to "prelacy." Community of suffering and the execution of Charles I. brought the royalist country gentry into sympathy with the clergy, and at the Restoration the church had the hold which it lacked under the Laudian rule.

The Restoration Period.—On the king's restoration the survivors of the ejected clergy quietly regained their benefices. The Presbyterians helped to bring back the king and looked for a reward; but the parliament of 1661 was violently anti-Puritan, and in 1662 passed an Act of Uniformity providing that all ministers not episcopally ordained or refusing to conform should be deprived on St. Bartholomew's Day, the 14th of August following. About 2,000 ministers are said to have been ejected, and in 1665 ejected ministers were forbidden to come within five miles of their former cures. Nonconformist worship was made punishable by fine and imprisonment, and on the third offence by transportation. In 1673, parliament passed a Test Act making reception of the holy communion and a denial of transubstantiation necessary qualifications for public office, thus excluding both nonconformists and Roman Catholics. Later, when the dissenters found friends among the party in parliament opposed to the crown, the church supported the king, and the doctrine of passive obedience was generally accepted by the clergy. Nevertheless the church was popular, and among the great preachers and theologians were Jeremy Taylor, Pearson, Bull, Barrow, South and Stillingfleet.

The church and the nation, however, were strongly Protestant, and were alarmed by the efforts of James II. to Romanize the country. James dispensed with the law by prerogative and appointed Romanists to offices in defiance of the Test Act. In 1688 he ordered that his declaration for liberty of conscience, issued in the interest of Romanism, should be read in all churches. His order was almost universally disobeyed. Archbishop Sancroft and six bishops who remonstrated against it were brought to trial, and were acquitted to the extreme delight of the nation.

Revolution Period.—James's attack on the Church cost him his crown. Protestantism was secured from further royal attack by the Bill of Rights; and in 1701 the Act of Succession provided that all future sovereigns should be members of the Church of England. That the king's title rested on a parliamentary decision was destructive of the clerical theory of divine right, and encouraged Erastianism, then specially dangerous to the church. William, a Dutch Presbyterian, secured the passing of an Act for toleration of Protestant dissenters who did not deny the doctrine of the Trinity. Anxious for further concessions to dissenters, he appointed a committee of convocation for altering the liturgy, canons and ecclesiastical courts, but the Tory party in the lower house of convocation was strong and the scheme was abortive. A long controversy began between the two houses: the bishops were mostly Whigs with latitudinarian tendencies, the lower clergy Tories and high churchmen. During most of the reign convocation was suspended and the church was governed by royal injunctions, a system injurious to its welfare. Nevertheless its religious life was active; associations for worship and the reformation of manners led to more frequent services, to the establishment of schools for poor children, and to the foundation of the Societies for Promoting Christian Knowledge (S.P.C.K.) and for the Propagation of the Gospel in Foreign Parts (S.P.G.). Unfortunately for the church, its supposed interests were used by the Tories for political ends.

The 18th Century.—With the accession of the Hanoverian line the church entered on a period of feeble life and inaction: many church fabrics were neglected; daily services were discontinued; holy days were disregarded; Holy Communion was infrequent; the poor were little cared for; and though the church remained popular, the clergy were lazy and held in contempt. The church was regarded as subservient to the state; and it was treated by politicians as though its principal function was to support the government. This change was accelerated by the silencing of convocation. A sermon by Hoadly, bishop of Bangor, impugned the existence of a visible church, and the "Bangorian controversy" (*q.v.*) which ensued threatened to end in the condemnation of his opinions by convocation, or at least by the lower house. As this would have weakened the government, convocation was prorogued, letters of business were withheld, and from 1717 until 1852 convocation existed only in name.

While the church was inactive in practical work, it showed vigour in the intellectual defence of Christianity. Controversies of earlier origin with assailants of the faith were ably maintained by, among others, Daniel Waterland, William Law (a nonjuror) Bishop Butler, whose *Analogy* appeared in 1736, and Bishop Berkeley. At length a deep and far-reaching revival of spirituality and energy set in, known in history as the *Evangelical Revival.* Its origin has been traced to Law's *Serious Call*, published in 1728. Law's teaching was actively carried out by John Wesley (*q.v.*), a clergyman who from 1739 devoted himself to evangelization. While he urged his followers to adhere to the church, he could not himself work in subordination to discipline; the Methodist organization which he founded was independent of the church's system and soon drifted into separation. Nevertheless, he did much to bring about a revival of life in the church. A number of the clergy were his allies, and these became the fathers of the Evangelical party. They differed from the Methodists in not forming a separate organization, but remaining in the church and working on the parochial system. The Evangelicals soon grew in number, and their influence for good was extensive. They laid stress on the importance of conscious conversion, giving prominence to the necessity of personal salvation rather than of incorporation with and abiding in the church of the redeemed. Bishop Porteus of London sympathized with them, Lord Dartmouth was a liberal patron, and Cowper's poetry spread their doctrines.

During the reign of George III. the progress of toleration, though slow and fitful, greatly advanced both as regards Roman Catholics and Protestant dissenters. The spirit of rationalism, which had been manifested earlier in attacks on revelation, appeared in a movement against subscription to the Articles demanded of the clergy and others which was defeated in parliament in 1772. The alarm consequent on the French Revolution checked the progress of toleration and was temporarily fatal to free-thinking; it strengthened the position of the church, which was regarded as a bulwark of society against the spread of revolutionary doctrines; and this caused the Anglican Evangelicals to draw off more completely from the Methodists. The church was active: the Sunday-school movement, begun in 1780, flourished; the crusade against the slave-trade was vigorously supported by Evangelicals; and the Church Missionary Society (C.M.S.), a distinctly Evangelical organization, was founded. Excellent as were the results of the revival generally, the Evangelicals had defects which tended to weaken the church. Some characteristics of their teaching were repellent to the young; they were deficient in theological learning, and often in learning of any kind; they regarded the church as the offspring of the Protestant reformation;

they expounded the Bible without reference to the church's teaching, and paid little heed to the church's directions.

The Oxford Movement.—Reforms within the church were urgently needed. In 1813, out of about 10,800 benefices, 6,311 are said to have been without resident incumbents; the value of some great offices was enormous, while many of the parochial clergy were wretchedly poor. The repeal of the Test Act, long practically inoperative, in 1828, and Catholic emancipation in 1829, mark a change in the relations of church and state; and the Reform Bill of 1832 transferred political power from a class which generally supported the church to classes in which dissent was strong. Yet wholesome changes were effected by legislation: dioceses were rearranged, plurality and non-residence were abolished, tithes were commuted, and the Ecclesiastical Commission, which has effected reforms in respect of endowments, was permanently established in 1836. But convocation remained silenced and the church was regarded merely as an institution subject to the state. Among the clergy generally ritual observance was neglected and rubrical directions disobeyed. A few churchmen, including Keble and Newman, set themselves to revive church feeling, and Oxford became the centre of a new movement. The cardinal doctrine of its promoters was that the Church of England was a part of the visible Holy Catholic Church and had unbroken connection with the primitive church; they inculcated high views of the sacraments, and emphasized points of agreement with those branches of the Catholic Church which claim apostolic succession. Their party grew in spite of the opposition of low and broad churchmen, who, specially on the publication of Tract XC. by Newman in 1841, declared that its teaching was Romanizing. In 1845 Newman and many others seceded to Rome. The Oxford movement was wrecked, but its effect survived both in the new high church party and in the church at large. As a body the clergy rated more highly the responsibilities and dignity of their profession, and became more zealous in the performance of its duties and more ecclesiastically minded. High churchmen carried out rubrical directions, and after a while began to introduce changes into the performance of divine service which had not been adopted by the early leaders, were deprecated by many bishops, and excited opposition.

The Church and the Law Courts.—In 1833 the supreme jurisdiction in ecclesiastical matters was transferred to the judicial committee of the privy council. Before this court came an appeal by a clerk named Gorham, whom the bishop of Exeter refused to institute to a benefice because he denied unconditional regeneration in baptism, and in 1850 the court decided in the appellant's favour. The decision was followed by some secessions to Rome, and high churchmen were dissatisfied that spiritual questions should be decided by a secular court. Convocation was revived in 1852. Meanwhile broad church opinions were gaining ground to some extent owing to a reaction from the Oxford movement. Among the clergy the broad church party was comparatively small, but it included some men of mark. In 1860 appeared *Essays and Reviews,* a volume of essays by seven authors, of whom six were in orders. The book as a whole had a rationalistic tendency and was condemned by convocation: two of the essayists were suspended by the Court of Arches, but its judgment was reversed by the judicial committee. An attack on the historicity of the Old Testament was published by Colenso, bishop of Natal, for which he was deposed by Bishop Gray of Cape Town, in 1863, but the judicial committee decided that the bishop of Cape Town had no coercive jurisdiction over Natal. Some practices introduced by clergy desirous of bringing the services of the church to a higher level came before the judicial committee in the case of *Westerton* v. *Liddell* in 1857, with a result encouraging to the ritualists, as they then began to be called. An increase in ritual usages, such as eucharistic vestments, altar lights and incense, followed. In 1860 the English Church Union was formed mainly to uphold high church doctrine and ritual, and assist clergy prosecuted for either cause, and in 1865 the Church Association, mainly to put down such doctrine and ritual by prosecution. A royal commission appointed in 1867 recommended that facilities should be granted for enabling parishioners aggrieved by ritual to gain redress, and in 1870 that a revised lectionary and a shortened form of service should be provided. A new lectionary was approved by the two convocations and enacted, and convocation having received letters of business in 1872 and 1874 drew up a shortened form of prayer which was also enacted, but the commission had no further direct results. Between 1867 and 1871 two decisions of the judicial committee were adverse to the ritualists, and by exciting dislike to the court among high churchmen indirectly led to an increase in ritual usages. Among those who adopted them were many self-devoted men; their practices, which they believed to be incumbent on them, were condemned as illegal, yet they saw the rubrics daily disregarded with impunity by others who trod the easy path of neglect. In 1873 a declaration against sacramental confession received the assent of the bishops, and in 1874 Archbishop Tait of Canterbury introduced a bill for enforcing the law on the ritualist clergy; it was transformed in committee, and was enacted as the Public Worship Regulation Act. It provided for the appointment of a new judge in place of the old ecclesiastical judges, the officials principal, of the two provinces. Litigation increased, the only check on prosecutions being the right of the bishop to veto proceedings, and in 1878–1881 four clergymen were imprisoned for disobedience to the orders of courts against whose jurisdiction they protested. In consequence of the scandal raised by this mode of dealing with spiritual causes, a royal commission on ecclesiastical courts was appointed in 1881, but its report in 1883 led to no results, and the bishops strove to mend matters by exercising their veto. Advanced and illegal usages became more frequent. Proceedings in respect of illegal ritual having been instituted against Bishop King of Lincoln, the archbishop of Canterbury (Benson) personally heard and decided the case in 1890, and his judgment was upheld by the judicial committee (*see* LINCOLN JUDGMENT). The spiritual character of the tribunal and the authority of the judgment had a quieting effect. (X.)

THE CHURCH SINCE 1890

The beginning of the last decade of the 19th century was marked by two factors which indicate the lines of subsequent development within the Church of England. These were the Lincoln Judgment and the publication of *Lux Mundi.* The one aided the progress of that ritualistic and doctrinal movement known as Anglo-Catholicism. The other was even more fundamentally important. It revealed the progress of Biblical criticism among men who secured the acceptance of the principles of that science in circles in which they had hitherto been identified with disloyalty to Christ, and so gave great impetus to the growth of Modernism, even within the Anglo-Catholic movement itself. Anglo-Catholicism has encountered the strongest opposition of a kind which has often been fanatical rather than thoughtful, and which has therefore assisted the movement it sought to destroy. In 1890 a certain Mr. Kensit founded the Protestant Truth Society, pledged to such opposition. It engaged in such measures as the raiding of ritualistic churches and the disgraceful interruption of divine worship in them, and attempted to secure the election to Parliament of men pledged to oppose ritualism. Archbishop Benson laboured for peace, but the feud was intensified by the Papal condemnation of Anglican Orders in September 1896. Certain French clergy had suggested that these Orders might be recognized as valid; and Leo XIII., most liberal of Popes, appointed a Commission to examine the matter. This Commission was understood to be favourable, but a committee of Cardinals reported adversely and the subsequent Bull *Apostolicae Curae* declared that "ordinations performed by the Anglican rite have been and are utterly invalid and altogether null." This set-back to Anglo-Catholic aspiration, so far from satisfying the Protestant opposition, provoked a renewed outburst of anti-Roman controversy, in which Sir William Harcourt, the champion of the earlier Public Worship Regulation Acts took a leading part. There can be no doubt that there was the most lamentable and flagrant disorder within the Church, though it was then as nothing to what it has since become. Various questions concerning it were argued at the Lambeth Hearings in 1899. The Archbishops condemned the ceremonial use of incense and of lights in procession, and, in general, diocesan Bishops have accepted this

decision as the law in the matter. In the following year the Reservation of the Sacrament was condemned. Individual Bishops have attempted to secure obedience to this prohibition, but no concerted action has been taken, and it has never been successfully enforced. Bishop Creighton held conferences at Fulham in an attempt to bring the opposing leaders together; Temple, anxious for the weightier matters of the law, allowed wide divergencies in externals. None the less the agitation became so acute that in 1904 a Royal Commission on Ecclesiastical Discipline was appointed, which in 1906 produced a Report filling five bulky Blue Books. It revealed departures from the use of the Church of England such as the interpolation into the Communion Office of prayers from the Roman Mass, the practice of Reservation, of the Mass of the Pre-sanctified, of Corpus Christi processions, of the invocation of the Virgin Mary and of Saints, and the observance of such Roman festivals as those of the Assumption and of the Sacred Heart. These practices were bluntly declared to be "clearly inconsistent with and subversive of the teaching of the Church of England." They suggested doctrines repudiated by the Church of England and "should promptly be made to cease." There was also some illegality at the other end of the ceremonial scale, *e.g.*, Evangelicals neglected to say the prescribed daily services, but the Commissioners, while noting such breaches, ruled that few of them had any doctrinal significance. At the same time it was stated with equal frankness that "the law of Public Worship in the Church of England is too narrow," the ecclesiastical courts were recognized as effete and their reconstruction was recommended, together with an increase of the Bishops' power in dealing with obstinate law-breakers, against whom it was suggested that the final measure should be not imprisonment but deprivation. It was further urged that Letters of Business should be issued to the Convocations to prepare a new Ornaments Rubric and "to make such modifications in the law relating to Divine Worship as may tend to secure greater elasticity." The Letters were duly issued. Convocation attempted compromises acceptable to neither party, and began a 20 years consideration of Prayer Book revision.

ROYAL COMMISSION REPORT

The Report of the Royal Commission, violent Protestant opposition, fatherly episcopal counsel coupled with inaction, have all been in vain. Anglo-Catholicism has grown and has done much to transform the outward appearance of the Church of England and the teaching given inside it. It gained no little impetus from the fact that it stressed that idea of historical continuity which characterized the time of its origin, it has been fortunate in the zeal of its devotees, and the undoubted attraction it possesses for a certain type of mentality. Its three Anglo-Catholic Congresses held in the Albert Hall have been thronged with devout men and women, and the same is true of many provincial congresses. These meetings elicit a religious emotional fervour which has not been witnessed in England since the days of Wesley. The work done by Anglo-Catholics among the poor is beyond praise and covers a multitude of intellectual sins. Like everything else in the Church of England it is a loose collection of elements by no means altogether agreed or consistent. It is eclectic, choosing from among the doctrines of Western Catholicism instead of from among those of Protestantism. From the days of *Lux Mundi* it has contained a Liberal and a traditionalist wing, and the divergence between them is growing. The former accepts Biblical criticism, sometimes in an extreme form, and also, though perhaps to a less degree, historical criticism. The more traditional section can scarcely be said to do so, except verbally. The great influence of *The Church Times,* to which the whole movement owes an immense debt (not all of one kind), steadily prevents any effective control of Anglo-Catholicism by its liberal scholars; these continue the best tradition of the Oxford Movement which has tried to stand on the side of learning and for the full use of art and knowledge in the service of faith. They largely adopt Newman's theory of Development. *Lux Mundi* revealed this feature in contrast to the attitude of earlier Tractarians. The Editor, in his essay on *The Holy Spirit and Inspiration,* recognized the fact of limitation in the human knowledge of Jesus; his "Kenotic" theory, rendered necessary by his historical and critical investigations, was a rather desperate attempt to retain the Chalcedonian Christology. The same principles which animated *Lux Mundi,* appeared again in a volume by some Oxford tutors called *Contentio Veritatis* (1902). The work has gone on and is exemplified to-day in all the best of the younger scholars of the liberal wing of Anglo-Catholicism. The more traditional Anglo-Catholicism is not without learned men, but they are few and old. The ideals of the more liberal school were clearly stated by Dr. Rawlinson in a paper entitled *Catholicism with Freedom* which he read at an Anglo-Catholic Congress in Birmingham. A protest followed from the unprogressive orthodox, similar to that caused by *Lux Mundi* a generation earlier. The traditions of that book have recently found admirable expression in the work *Essays Catholic and Critical,* in which the essential corner-stone of Roman and traditional Catholicism—oracular external authority—is repudiated in the clearest terms. The book gives an account, and offers some defence of, a form of Christianity which values historical continuity, Catholic custom and, above all, sacramental religion, combined with a full acceptance of modern criticism and learning.

It is very unfortunate, however, that this is not the type of Anglo-Catholicism taught in most churches of the movement. There is a large and influential propaganda which is definitely Roman in spirit and outlook, in its teaching about revelation, about ecclesiastical authority as a ground of belief, about the binding character of tradition; definitely Roman in its forms and modes of worship. It is denied that the Church of England, apart from Rome, has any authority for her members in matters of faith. The hope is cherished, through many disappointments, that some day infallibility will compromise with its own claim; there is a pathetic longing for recognition by Rome. This is a fundamental departure from the attitude characteristic of the Oxford Movement. Among this traditionalist school, Biblical criticism is somewhat regretfully accepted in regard to the Old Testament; it is not denied that it must be applied to the New, but it is allowed to have no doctrinal consequences. It is openly confessed that Anglo-Catholicism wishes to do for England what the Counter-Reformation has done for Belgium, for Northern France, and for Southern Germany, and that to try this system means to try it as a whole. Further it is claimed that there is no important difference between the Anglican Eucharist and the Roman Mass. Thus, in June, 1924, some 3,000 Anglican clergymen, including Bishop Gore, presented a "Declaration of Faith" to the Orthodox Patriarch of Alexandria. It stated that "the signatories affirm that they hold it to be the genuine doctrine of the Anglican Church that they have received Apostolic Orders through their Bishops with the purpose that we should offer the unbloody Sacrifice of the Eucharist for both the living and the departed. We hold that by consecration the bread and wine are changed and become the true Body and Blood of Christ, and we hold that Christ, thus present, is to be adored." This, as a leading Jesuit affirms, states the pre-Reformation belief, and the belief of Rome to-day, but to call it the historic witness of the Anglican Communion during the past 375 years, or to say that it is the official Anglican faith to-day is to state what simply is not a fact. Indeed, there are many Churches in England to-day in which the whole Roman system is inculcated, except the doctrine of Papal Infallibility, and an attitude of deferential respect even to this claim is much more common than any opposition to it. It is said that Catholic doctrine is static; the most there can be is variation and development of interpretation; that the order of the Christian Church was decided once for all in the years immediately following the Ascension; that the Creeds, the Sacraments and the Episcopal Ministry derive their authority directly from the Apostles, and that any modification of them would involve the abandonment of what is essential to Christianity.

MODERNISM

The other development of thought which, with more or less consistency, has steadily grown in the English Church since the last decade of the 19th Century, is the phenomenon known as Modernism (*q.v.*). While it is absurd to suggest that an insistence on the practical nature of the gospel, and the preaching thereof, is

characteristic of any one school of thought; it is nevertheless true that, at least in earlier days, the emphasis of Modernism has been concerned with the intellectual element in religion. It is, among other things, a protest against a stereotyped intellectualism. The content of Modernism is not easy to distinguish inasmuch as it represents a fundamental attitude of mind rather than a system of thought. In brief, it demands that a fair hearing be given to every new suggestion, and is anxious to make use of whatever in the knowledge, practice or aspiration of the modern world can be used by the Church in its task of reconciling man to God. It recognises that Biblical criticism which has made its way in the Church of England through the efforts of such men as the late Drs. Driver and Sanday, and Bishop Gore, involves a totally different attitude towards the Bible from that formerly common to all schools of Anglican theology. It is a movement inside the Church, and aims at a reconstruction of theology. It demands that the claims of scientific history have to be applied, and the results accepted, in the study of traditional theology, and it involves a fundamentally different attitude to Dogma, the relations of Faith to History, and Authority, from that which is characteristic of the Roman or narrower Anglican type of Catholicism. It has little organisation. At the close of the 19th century "The Churchmen's Union for the Advancement of Liberal Religious Thought" was founded, and has steadily increased in membership though it does not include a tenth of those who sympathise with its ideals. As early as 1905 there appeared an important "Declaration on Biblical Criticism," asking that the clergy should receive "authoritative encouragement" to face the critical problems of the New Testament with entire candour. It further declared that grave responsibility and peril was involved in building "the faith of souls primarily upon details of New Testament narrative, the historical validity of which must ultimately be determined in the court of trained research." This Declaration was signed by some 1,362 of the home clergy and about 360 of those working in Colonial and foreign lands. Today, though there is much difference and controversy about the implications of Biblical criticism, the fact of it is so widely accepted that there is no University or College of any note in this country where the old view of the Bible is defended. Only among a very few of the older Anglo-Catholics and Evangelicals does it still survive. A book of essays called *Liberal Evangelicalism* (1920) shows to what extent the basis of this latter and honourable school of English Churchmanship has been modernized.

But Modernism, like Anglo-Catholicism, has not made its way without the hindrance, and occasional assistance, of hostile opposition. In 1911 the Rev. J. M. Thompson published a book called *Miracles in the New Testament.* His explicit denial that the "wonder" type of miracle ever happened produced a storm. He was compelled to abandon the exercise of his office in Magdalen College, Oxford: to-day the same position can be freely adopted without the least danger of any action being taken. The next year saw the publication of essays by some Oxford theologians under the title *Foundations.* The contribution of the Editor, Canon B. H. Streeter, who is among the foremost of English New Testament scholars, aroused hostile comment; in particular, his suggestion that the Resurrection appearances were of the nature of visions gave much offence. Today a similar view is maintained in *Essays Catholic and Critical,* by a very advanced Anglo-Catholic, and no outcry has been raised. It is probably the case that the change is more due to decline of interest in such controversies than to the spread of more modern views. A further noisy protest against Modernism was made in 1914, by Bishop Weston of Zanzibar, an extreme Anglo-Catholic. His protest was occasioned partly by the Hulsean Lectures on *The Eschatology of Jesus,* and led to a debate in the Upper House of Convocation. Their Lordships passed the inevitable resolution, the form of which tended in opposite directions. It was affirmed that "the denial of any of the historical facts stated in the Creeds, goes beyond the limits of legitimate interpretation, and gravely imperils that sincerity of profession which is plainly incumbent on the ministers of the Word and Sacraments," yet, in view of what they called "new problems" raised by "historical criticism," the Bishops demanded "considerateness in dealing with that which is tentative and provisional in the thought and work of earnest and reverent students": to-day, few Bishops would refuse to ordain an otherwise suitable candidate who stated his inability to affirm belief in such a miracle as the Virgin Birth. A further transient controversy was aroused by the appointment of Dr. Henson to the see of Hereford: an attempt was made to induce the Archbishop to refuse consecration on the ground of heresy of the Bishop-elect. He was duly consecrated in Feb. 1918, and to-day, as Bishop of Durham, is on the side of a moderate Anglo-Catholicism and is a foremost champion of the spiritual independence of the Church. Two years later the Lambeth Conference assembled, but no guidance was forthcoming on the situation created by Modernist advance. In 1921, at a Conference at Girton College, Cambridge, organised by The Churchmen's Union, the inadequacy of the traditional forms of Christological doctrine was affirmed in the most definite terms. Full account was taken of the bearings of Biblical criticism and modern knowledge, and an attempt was made to restate belief in Christ in modern terminology. A bitter controversy followed, the readers of the Conference papers being freely accused of denying the divinity of Christ. The English Church Union, the largest Anglo-Catholic organization, took up the matter and petitioned Convocation to declare the opinions expressed at Girton contrary to the teaching of the Bible and the Church. The Churchmen's Union presented a counter-petition which was signed by many distinguished theologians outside the Society. The Canterbury Convocation acknowledged "the gain which arises from free enquiry at once fearless and reverent into the meaning and expression of the faith" and deprecated "the more blunt denunciation of contributions made by earnest men in their endeavour to bring new light to bear upon these difficult and anxious problems." The need for caution received emphasis. The Convocation of York pronounced even more favourably in a Modernist direction. Today scholars within the Church of England enjoy a full freedom in study and in the publication of its results; only a party of Anglo-Catholics, and these not the scholars to whom Anglo-Catholicism must look for its future defence, would wish to expel Modernists from the Church.

SCHOOLS AND THE CHURCH

Since 1870, when the State began to provide primary schools in districts where there were no Church schools, education has been steadily but surely passing out of the control of, and largely out of all association with, the Church. In State schools religious teaching is neither ordered nor forbidden, except that the famous "Cowper-Temple clause" provides that no teaching distinctive of any particular denomination may be given in them. In 1896, a Conservative Government, pledged to support Church schools, introduced a far-reaching measure providing for grants to poor voluntary schools in aid of staff and apparatus and that local managers should make arrangements for denominational instruction in religion where a number of parents desired it. Unfortunately for these schools, the Bill was withdrawn. In 1901 another attempt at settlement was made by Convocation. The basis of it was the public financing of secular teaching in all schools coupled with provision for effective local control in the case of voluntary schools. While demanding Church teaching for Church children in Board schools, Convocation proposed facilities for the denominational teaching of other children in Church schools. In the following year Mr. A. J. Balfour's Bill proposed to make the County Council (in the Counties) and the Borough Council (in the Boroughs) the only educational authority; managers of voluntary schools were to provide for the maintenance and improvement of their buildings, but they were to be given a majority in the controlling authority so that they could appoint teachers paid with public money. That the control of religious teaching should be taken from the parson and vested in the managers was opposed by many Anglicans unable to recognize good in any convictions not those of the parish priest; Roman Catholics were committed in advance to opposition; Nonconformists objected to having to pay for religious teaching which they disliked and could not control. The Bishops approved the Bill and it became law. Subsequent attempts to change matters have so far proved abortive: The

difficulties of the Church schools have enormously increased and necessity will decide their fate. The raising of the general educational standard has increased expense; the cost of post-war building is alone sufficient to make the difficulties acute. Primary education is slowly but surely passing altogether from direct association with the Church. In secondary education the same transition proceeds. The Public schools alone maintain their independence by reason of their fees, but few of them are directly connected with the Church of England. At the older Universities all "religious tests" have gone; if the official services are those of the Church of England they are, where voluntary, poorly attended. Thoughtful and learned University sermons are delivered to congregations, small and grey headed, almost bereft of undergraduates. The modern Universities for the most part have no ecclesiastical allegiance and provide no, or next to no, training in the teaching of religion. Since 1921 the Board of Education is no longer prevented from making grants from public money to secondary schools where the teachers are required to belong, or not to belong, to a particular denomination, but in these schools, Church influence is practically non-existent. In elementary schools "the religious question" has been little more than a squabble about ecclesiastical and political rights, in which the interests of the children have escaped attention. Happily, however, the old definite lines of cleavage in this matter between Churchmen and Nonconformists are less clear. The Churchmen who hold that only "definite Church teaching" is worth giving to Church children are a diminishing number: an increasing number weigh the fact that thousands of Church children are educated in Council schools, and realize that the Church has responsibility to the nation at large. Free Churchmen naturally still feel at a disadvantage in districts where the Church school is the only one, but they are increasingly willing to co-operate in efforts to establish a system of religious teaching at once definite and free from emphasis on particular denominational tenets. The regular teachers resent the intrusion of outside teachers of religion who know nothing of the art of teaching, and, less reasonably, are apt to object to any qualifications being demanded of themselves. They have a real grievance in the fact that too many headships are only open to members of the Church of England. But with the spread of the demand that education shall be directed to the training of good citizens rather than denominational bigots these difficulties will prove less and less intractable.

The last forty years have witnessed great changes in the organisation of the Church, and a wealth of legislative acts. As early as 1872 there was much talk about the Disestablishment of the Welsh Church. In 1894 an attempt to make it a fact by the Liberal Government then in power proved abortive. But in 1906 a Commission was appointed to examine the condition of the Church in Wales. It was revealed that, while the Church was the largest of the religious bodies in the Principality, less than a quarter of the inhabitants nominally belonged to it. In 1912, though the project was never really popular in England, a Measure of Disestablishment was introduced into the Commons and passed, but it was rejected in the Lords. It was reintroduced and passed under the Parliament Act, and the separation was finally effected in 1920. The Bishop of St. Asaph became the first Archbishop of Wales and now presides over six dioceses, two new ones having been added since 1920. A splendid co-operation between clergy and laity has triumphed over the crippling effects which were predicted as the inevitable consequence of the Act of Disestablishment.

Ever since the revival of Convocation there has been an increase in the number and importance of deliberative bodies within the Church. Since 1878 a Conference of the Bishops of the Anglican Communion has been called to meet at Lambeth once in every ten years (*see* LAMBETH CONFERENCES). The desire for lay co-operation and support led to the formation of a House of Laymen in each Province, the members of which were elected by the Diocesan Conferences. But these Houses had no legal or ecclesiastical status. In 1896 the Convocations of Canterbury and York held a joint Session with the two Houses of Laymen, and in 1905 a body called the Representative Church Council was formed of members of the Convocations and of the Houses of Laymen. In 1913 this Council petitioned the Archbishops to appoint a Committee on Church and State "to enquire what changes are advisable in order to secure in the relations of the Church and the State a fuller expression of the spiritual independence of the Church as well as of the national recognition of religion." An unofficial organization known as *The Life and Liberty Movement* did much to awaken popular interest in the need for change. The Archbishops' Committee published its Report in 1916, on the basis of which Convocation in 1919 presented an Address to the Crown, recommending legislation to provide for a National Assembly of the Church of England. In December of the same year the Church of England Assembly (Powers) Act (otherwise known as the Enabling Act) became law. The Assembly constituted under this Act has power to prepare and pass Measures for submission to Parliament for approval, "relating to any matter concerning the Church of England." All baptized members of the Church of England of responsible age who will signify themselves as such and declare that they are not members of any religious body not in communion with the Established Church may have their names entered on an Electoral Roll, kept in every Parish. Of these electors there are some $3\frac{3}{4}$ millions. In every parish they elect a Parochial Church Council whose function, as defined by a further Powers Measure of 1921 is "to co-operate with the incumbent in the initiation, conduct and development of Church work both within the parish and without it." The Councils elect Ruridecanal and Diocesan Conference members, and the lay members of the latter elect the House of Laity in the Church Assembly; the number of representatives for each diocese depends on the total number of parochial electors in the diocese. The Church Assembly meets in February, July and November for five-days Sessions. It works through many Committees. A Measure, corresponding to a Parliamentary Bill, is prepared by a Committee, circulated to Members of the Assembly and formally introduced. General Approval is sought for it. There follows a stage of Revision in which amendments may be interested. Then comes a Committee Stage, and sometimes a Drafting Stage, in which verbal adjustments are made. The Measure is then presented for Final Approval and, if this is secured, it is handed over to the Legislative Committee of the Assembly for presentation to the Ecclesiastical Committee of Parliament. This last is a body specially constituted under the Enabling Act. Fifteen members of each House are nominated respectively by the Lord Chancellor and the Speaker and hold office during the life of a particular Parliament. It is the duty of this Committee to examine Assembly Measures, and to report on their nature, legal effect and expediency, whereon (the Report being favourable) any member of Parliament can propose that it be presented to His Majesty for Royal Assent. Parliament must either approve or reject the Measure, but cannot amend it. If both Houses pass it, the Measure becomes law on receiving the Royal Assent.

ADVANTAGES OF REFORM

The great advantage of this reform is that it provides a representative body with a legal status through which the Church can initiate reform. It can carry out work for which Parliament has neither the time nor the qualifications. Facts reveal its utility. During the 25 years from 1888 to 1913, some 217 Bills dealing with ecclesiastical matters were introduced into the House of Commons; 33 of them became law, though only one was rejected: the remainder were dropped for lack of time. Since 1920 more than 20 Measures have received the Royal Assent, that is two-thirds of the former number in slightly more than a quarter of the time. The Convocations which formerly were largely *ex officio* bodies have been reformed and made more representative. Their relation to the Church Assembly is by no means clear, but it is likely that they will continue, in spite of their superfluous character, for reasons of historical sentiment, and because Anglo-Catholics think that so many of the matters with which the Assembly deals affect the clergy alone, and that priestly approval is always doctrinally necessary. Thus, since the Convocations give their approval to Assembly Measures, and are, in fact, themselves the Episcopal and clerical Houses of the Assembly, this feeling of

Church opinion is respected by a redundant formality, which adds substantially to that avalanche of words which seems to be regarded as a sign of religious vitality. A brief summary may be added of the more important of the Measures which have become law since the Enabling Act. (a) In 1921 a scheme was introduced for securing a better distribution of the diminishing man-power of the Church by providing for the amalgamation into a single parish of cures too small to provide adequate work for one parson. The arguments in favour of this policy are theoretically unanswerable, but, in practice, it always elicits strong opposition. (b) A Measure of 1923 prohibits the sale of the right to appoint to a benefice: after the two vacancies next following the passage of the Measure, no such sale can take place. (c) The Clergy Pension Measure of 1926 provides that every parson under the age of 55 must contribute 3% of his ecclesiastical income to the Pension's Fund. This secures a maximum pension of £237 *per annum* at the age of 70 after 40 years service. The contributions of those who die earlier are returned with compound interest. A capital foundation of £350,000 was provided by the Ecclesiastical Commissioners who also made an annual contribution rising to £100,000. The Church Assembly Fund also provides £50,000. This measure removes the long standing scandal of the fact that no provision was made for the old age of an ill-paid clergy beyond allowing a man, on resignation, to appropriate part of the income of the benefice as a pension and thus frequently to handicap his successor. A similar Measure provides for episcopal pensions. (d) The Delapidations Measure of 1923 arranged for the systematic repair of parsonage houses, which are regularly surveyed. Definite annual contributions are made from the parish or by the parson; the Ecclesiastical Commissioners provide £500,000. In the case of benefices under the annual value of £250 Queen Anne's Bounty is empowered to pay half the initial cost of repair and, thereafter, half of the annual charges. (e) The Sees Committee has been very active. The ancient diocese of Winchester has been divided into three, the two new dioceses being those of Portsmouth and Guildford; a new diocese of Leicester has been carved out of Peterborough, Blackburn out of Manchester, Derby out of Southwell. A proposal to divide Lichfield was rejected by one vote in the Lords. There exists considerable doubt both as to the wisdom and the necessity of this policy of multiplying Bishoprics. There is no corresponding growth in Church membership to demand such an increase of episcopal oversight; and, where money is scarce, the founding of new sees is a luxury; improved methods of locomotion should make episcopal work easier; it may be doubted whether there are enough men of eminence to fill so many sees, and still more so whether there will be in the future. (f) The Assembly asked the Archbishop to appoint a Commission to inquire into the Property and Revenues of the Church. After 3 years work a Report was produced which is a mine of information on all aspects of ecclesiastical finance. The Commission suggested a wider use of the money controlled by the Ecclesiastical Commissioners, a more equitable distribution of the total amount available for the parochial clergy, and certain reforms in the administration of Cathedral estates, the payment of episcopal stipends, etc. Some of these recommendations have already been carried into effect: others are still being considered. (g) The Benefices (Ecclesiastical Duties) Measure of 1927 provides that when a charge of negligence is brought against any incumbent, the Bishop can appoint 7 persons, one of whom may be nominated by the accused incumbent, and if their enquiry results in proved neglect of duty, more drastic steps can be taken than were formerly possible. Considerable objection was raised against this Measure on the grounds that "inadequate performance of duty" is an exceedingly vague charge, and that it is not necessary to state the grounds of complaint in detail before the Commission is appointed.

Certain other Measures have been before the Assembly for a long time, but have not yet resulted in definite legislation. Two of them are very contentious. One proposes extensive and far reaching changes in the exercise of patronage: the other is concerned to reform the Courts Ecclesiastical. Reconstitution of the latter was recommended by the Royal Commission of 1904. The trouble is that a large number of clergy will not recognize the competence of the Judicial Committee of the Privy Council as the Court of Final Appeal in spiritual matters, and demands its replacement by a spiritual court. There is, however, little likelihood that the proposals which have so far been made on either of these subjects will ever pass into law without considerable modifications. Whatever criticisms can be made upon the working of the Church Assembly and its actual achievements, there is no doubt that since the Enabling Act the corporate consciousness of the Church has been deepened. The Assembly Press and Publications Board is extremely useful in increasing the general knowledge about Church affairs, a very necessary preliminary to the securing of adequate financial support. In 1923 the dioceses contributed to the Central Board of Finance 61% of the apportionment invited from them: in 1925, 71%, 6 dioceses sending the full quota. The Diocesan Finance Boards are coming to regard their payment to the Central Board as a claim equal to that of their own diocesan needs.

In recent years, and particularly since the War, the sense of the scandal of divided Christendom has been much increased. Consciousness of the weakness of divided Christian witness has been one of the aids of repentance. Some Protestant Churches have achieved federation; the tendency to form new sects has disappeared. On the other hand, the hope of reunion with Rome makes it far harder to achieve it with other Churches. According to the Roman theory the Church cannot be divided; those who break away are outside it and must return to it by way of repentance and submission. For Rome "reunion" has no meaning. Nevertheless efforts in her direction are increasing. Since the Lambeth Conference of 1920 issued its "Appeal to all Christian People" they have been, on the Anglican side, more official in character. Bishop Gore, Dr. Frere (Bishop of Truro), Dr. Kidd (Warden of Keble College, Oxford) and others have held a series of "conversations" at Malines with certain Belgian and French clergy anxious for reunion. These "conversations" were under the chairmanship of Cardinal Mercier and, later, under that of his successor, Cardinal Van Roey. By Anglo-Catholics these attempts have been regarded with hope, by Evangelicals with fear and dislike, by Modernists with a languid interest devoid of hope. The later "conversations" were held with the "cognizance" of the Pope. But the differences between the Anglican Church and Rome are fundamental and afford as good an example of the law of contradiction as could be found, and they remain exactly what and where they were. The official Report of these "conversations" was published, after being in print and withheld for six months, in order (so the presumption must be) not to prejudice the calm consideration of the Prayer Book revision proposals. Almost at the same time came the Papal Encyclical *De Vera Religionis Unitate Fovenda*. It marks the end of all hope of reunion with Rome, and is as definite a condemnation of Anglo-Catholicism as was the *Pascendi* (1907) of Modernism. All assemblies for the discussion of reunion, such as were contemplated by the Lambeth Appeal, are forbidden to Catholics who, by taking part in them "will be giving countenance to a false Christianity quite alien to the one Church of Christ." The official organ of the Vatican, *Osservatore Romano,* declares that the Pope acknowledged the Malines "conversations" merely as an effort between private persons. "They were not invested with any sort of mandate." The same authority adds that the resumption of them will not occur by the consent or encouragement of the Pope.

INTER-CHURCH RELATIONS

Notwithstanding the hopelessness of efforts towards reunion with Rome, the connections of the Church of England, and friendly relations, with the rest of Christendom have grown considerably during the present century. Between Canterbury and the Eastern Orthodox there has been some *rapprochement;* in 1906 a Society of members of each obedience was formed to promote reunion; the years of the War brought the Church of England into contact with Churches abroad; later appeals were made to the Archbishop from the Russian Church in her trouble with the Soviet Government, and the support given may have done much to save the life of the Patriarch Tikhon. The Patriarchate of Constantinople has been officially represented in discussion of

Anglo-Orthodox relations, and in 1922 the Synod of Constantinople formally acknowledged the validity of Anglican Orders; the Churches of Jerusalem and Cyprus have since concurred. Old Catholics of Holland gave similar recognition in 1925. With these Churches, relations are being maintained. None the less, honesty compels the admission that the Eastern Churches would only consider organic union on a dogmatic basis, and that of a kind and content which, except to the more narrow of the Anglo-Catholic party, appears out of the question for the Church of England. In 1920, two Anglican Bishops assisted at the consecration of two Swedish Bishops and occasional intercommunion between the two Churches has been established. With the English Nonconformists the hope of reunion was brighter, but has recently passed under a cloud. All approaches to Rome, however tentative, retard this more practical hope. The Lambeth Conference of 1905 reaffirmed as the basis of reunion what is known as the Lambeth Quadrilateral, namely, the necessity of the acceptance of (a) Holy Scripture as the rule of faith, (b) The Apostles' and Nicene Creeds, (c) the Two Sacraments, (d) Episcopacy. The matter was brought prominently into notice by the Kikuyu Controversy in 1913 and 1914. With the encouragement and the consent of the Bishops of Uganda and Mombasa intercommunion had taken place with the Protestant Churches in East Africa. The Bishop of Zanzibar (Dr. Weston) appealed against it to the Archbishop. The result was a pronouncement that full intercommunion was at present impossible; nevertheless a welcome at Holy Communion in Anglican Churches was extended to non-episcopalians isolated from their own communions. Since the "Appeal to the Christian People" of 1920, Anglicans and Free Churchmen have conferred at Lambeth under the Chairmanship of the Archbishop of York; both Archbishops have given addresses at annual assemblies of Free Churchmen; Free Church ministers occasionally preach in Anglican Cathedrals and Churches with episcopal approval. None the less, the demand of Episcopal Ordination has proved an insurmountable barrier. The Lambeth appeal acknowledged Free Church Ministries to be real ministries within the Catholic Church: Free Churchmen naturally do not see the logic of the requirement of a fresh commission on their side, while Anglicans would receive only a formal recognition to make them acceptable within the present limits of the Free Churches. They feel that episcopal ordination could add nothing to the existing and acknowledged validity of their ministries. The Baptist Union has repudiated the proposals; the Congregationalist reply urged the necessity of loyalty to Reformation principles, and, while refusing ordination *sub conditione*, Congregationalists would be willing to accept a solemn act of mutual recognition. At the moment of writing, all official conferences are closed indefinitely. It is not easy to see what any of the churches are ready to surrender in order to attain union; but it is not rash to predict that the fact of episcopacy as an ancient and workable system of government and order will ultimately be accepted, provided that all theories of its divine authority and necessity are abandoned. In the mission field, and particularly in South India, schemes for reunion are more hopeful.

During the last 12 months (1928) no fewer than three international Conferences have been held—at Stockholm, at Lausanne and at Jerusalem. Though the Stockholm Conference was mainly directed towards the development of an international Christian consciousness in social matters, the basic hope of all three has been for closer and united co-operation between the Churches. The Lausanne Conference, after years of preparation, was attended by more than 500 representatives of some 90 denominations. Many questions of the Ministry and organization were discussed; advance was made towards a common understanding of the Gospel. The Eastern Church representatives made it clear that they could concede nothing in respect of the Creeds, or ever allow the validity of non-episcopal ministries. Lausanne was on too vast a scale to achieve anything definite: its chief value was in the ventilation of views and in promoting friendships.

There has been steady extension of missionary activity in every part of the world, but the growth in available men and money has not kept pace with the growth in opportunity, or even with the maintenance of work already undertaken: In 1903 the United Mission Boards approved the holding of a great pan-Anglican Congress, which met in London in June 1908, when 250 Bishops, with clerical and lay delegates from all parts of the world met for conference. Yet, by 1911, the most vigorous missionary society, the C.M.S., even after sacrificing the greater part of its Capital Fund in 1905, was faced with a deficit of £48,000, and restricted its work. The S.P.G. and the S.P.C.K. continue their work, not without great difficulty and anxiety. The Church cannot adequately cope with the great mass movements towards Christianity in India; she has not been able to keep pace with the acceleration of change in East Africa, and in the East generally. It is stated that nothing but an immediate and large increase in staff and funds will conserve or develop the work in tropical Africa. This state of affairs is not due to a falling off of interest. Home missionary endeavour has been centralised. The C.M.S. and S.P.G. have withdrawn their quarterly papers, and a new one, official for the Church of England, called "The Church Overseas" replaced them in January 1928. The Church Assembly has its Missionary Council. In 1926 a World Convention of 2,700 delegates assembled at St. Paul's. It was designed to arouse missionary interest on a large scale. The Assembly published four Reports or "Calls"—from the Far East, from Africa, from India, and from the Muslim World. A fifth Report dealing with the obligations of the Church towards her own countrymen overseas was published in 1927. These exhaustive Reports give an account of the achievements, present work and obligations of the Anglican Communion in the Mission Field. They reveal chiefly how great the changes have been in the recent past and how much has been accomplished from very slender resources. It is estimated that to keep up existing work, 433 new missionaries are needed at once, 120 more for urgent extension and 180 annually to replace the inevitable wastage. In money, at least £250,000 *per annum* is needed. There has been a progressive movement towards autonomy on the part of Dominion and Missionary Churches. The Church in India is now (since 1927) separate in law from the Home Church, though remaining in full communion with it. Canterbury remains the acknowledged Mother See, though neither claiming nor exercising a primacy comparable to that of the Pope.

THE CHURCH AND OUTSIDE PROBLEMS

Side by side with the increased consciousness of the place of missionary effort in the life of the Church increasing attention has also been given to political, social and economic problems. The Church cannot ignore the challenge of the Labour Party that it represents the true principles of Christianity more adequately than does the Church. The evidence of a deeper interest on the part of the Church is seen in the part her members have taken in the Industrial Christian Fellowship and in "Copec" organizations pledged to assist the Christianizing of the corporate life of mankind in all its activities. The Lambeth Conference of 1920 spoke of the need of "a fundamental change in the spirit and working of our economic life," and stated that "this change can only be effected by accepting as the basis of industrial relations the principle of co-operation in service for the common good in the place of unrestrained competition for private and sectional advantage." There would be general agreement among Christians about this: the difficulties and the differences appear over the question of how it can be accomplished. There is a widespread feeling, both inside and outside the Established Church, that the Church must foster and maintain the Christian spirit and preach Christian principles; but that the working out of these in concrete proposals requires expert knowledge which Christians, as such, do not necessarily possess. It is therefore often felt that the attachment of the Church to a definite programme of social reform, particularly one not devoid of political interests, is to be deprecated. The attempt of certain Bishops, acting in concert with Free Church leaders, to interfere in the dispute in the coal industry in 1926 met with much criticism, not all of which was either ignorant or dictated by political hostility.

The World War had far-reaching effects on the life of the Church, more fundamental than spectacular. The clergy acquitted themselves with honour. No fewer than 186 of them became

temporary Chaplains in the Navy, bringing the total in this service up to 318: 17 were killed in action. The Clergy also supplied 3,036 Temporary Chaplains in the Army of whom 112 were killed on active service. In all 419 decorations were awarded, as follows: V.C. 3; C.M.G. 10; D.S.O. 40; M.C. 250; C.B.E. 20; O.B.E. 69. The War revealed an appalling ignorance of the most elementary Christian truths on the part of ordinary men of the good type who joined the Temporary Army. It also meant the end of religion for thousands for whom religion was identified with the miraculous; rational faith in the supernatural was weakened and this has led to an alarming increase in superstition. Much thought and preparation was expended during the years 1916–18 for a National Mission of Repentance and Hope. It failed.

The most disturbing factor in the life of the Church of England to-day is the inadequate supply of Clergy. During the years 1877–1886 the annual number of those ordained rose steadily to 814. This figure has never since been attained. In the year 1923 when the supply of "Service Candidates" (*i.e.*, men who had served in the Army and Navy during the War) was at its height, 463 men were ordained. This number was 70 below the lowest record during the ten years before the War. Since 1924 there has been a small increase, but the numbers are smaller than between 1922–1924. Whereas from 1880–1911 the annual average was about 700, now it is about 350. Though the population is half as large again as it was in 1880, the Church has about the same number of clergy. In 1926 there were 12,906 incumbents and 4,478 assistant curates. The shortage is between 7,000 and 9,000, and if the new ordinands numbered 400 a year, the Church could not fill 12,000 benefices in the year 1940. Already there are many parishes of 10,000 people with no clerical assistant to the incumbent. The situation is clearly stated by the Editor of "Crockford," for 1927: "The average age of the existing clergy was said, a short time ago, to be nearer sixty than fifty, and this means that the rate of death and retirements, which appears at present to be about 550 *per annum*, will accelerate rapidly during the next ten years. . . . It is not too much to say that if the history of the last ten years is continued for another ten, the effective maintenance of the parochial system will have become impossible in all but a few favoured localities. Anything which can fairly be called *The Church of England* will have ceased to exist and its place will have been taken by the sporadic activities of a denomination." Various causes of this depressing state of affairs are assigned. There are misconceptions of the Ministerial office; other activities give better and less restricted openings for more useful service; intellectual difficulties about Christian doctrine no doubt keep many outside; sacrifices are demanded of those who come forward, and few inducements are offered. It is pointed out that the lack is rather of money than of candidates: societies like Mirfield, where free training is given, receive hundreds of applications every year. This does not explain why men with a certain amount of private means who used formerly to take Orders now so seldom do so. The reasons given for the shortage reveal, and some of them conceal, the fact that Christianity as exemplified in the Church of England does not elicit the same responsive service as it used to do. Much has been done, and is being done, to assist men who cannot pay for their own education. During the years 1921–1924, of the 1,637 men ordained, 660 were "Service Candidates," men who were assisted in accordance with an undertaking given by the Archbishop that no suitable man serving with the Forces should be denied Ordination merely for lack of private means. The Central Board of Finance makes Training for the Ministry one of the main charges upon its Funds. A scheme by which "Sponsors" were invited to make themselves responsible for individual Candidates recently raised £20,000 in 5 weeks. Much money is raised for the same purpose in the interests of particular schools of thought. At the same time some advance has been made in the intellectual standard of the actual examination demanded of Ordinands. To-day, nearly all Bishops accept the General Ordination Examination, conducted by an independent body of extra-Diocesan examiners. But men can still be ordained with practically no knowledge of the science and art of preaching, of the principles of education, of social problems, of the psychology of religion or of comparative religion. The higher standard in the actual examination subjects demanded, does not compensate for the fact that the general educational, cultural and social standard and status of ordinands is lower than formerly.

PRAYER BOOK REVISION

The subject in the affairs of the Church which has recently eclipsed all others has been that of Prayer Book revision, a work which has recently concluded in a double failure to obtain Parliamentary sanction for the proposed revision. The subject had occupied the not too hasty attention of Convocation from 1906–1920. Finally proposals were introduced into the Church Assembly, amended by the Houses of Clergy and Laity and handed to the Bishops for final revision. After months of secret conclave, the Bishops presented their final proposals to Convocation in February 1927, in the form of a Composite Book containing the Book of Common Prayer of 1662 with the Revision as a permissive alternative thereto. It omitted such rubrics as were superseded by a list of general rubrics applicable to both Books. These were all in the direction of greater liberty and concerned the services of Holy Communion, Public Baptism of Infants, Confirmation and Solemnization of Matrimony. The Ordinal of 1662 was replaced by that of 1927. Provision was made for additional services so long as they were not substituted for those of, or contrary to anything contained in, the Book of Common Prayer or the Revised Book. Numerous occasional prayers were added, also Thanksgivings, Collects, Epistles and Gospels. The Ornaments Rubric was reprinted, without interpretation, but a variety of vestures at Holy Communion was definitely allowed. Portions of the Psalms were permitted to be left out in public worship. A form of Compline was also included.

Keen controversy arose over the revision of the Communion Office. Herein the outstanding changes were (a) Permission to reserve a portion of the consecrated bread and wine for any sick persons unable to be present in Church, in order that the same should be taken to the sick person "on the same day and with as little delay as may be," (b) what is known as Perpetual Reservation; that is, the priest was to be allowed to set aside consecrated bread and wine for other and emergency cases of sickness, and of approaching death, if the Bishop gave a licence for so doing. The Bishops directed that such reservation should be "only for the Communion of the Sick, shall be administered in both kinds, and shall be used for no other purpose whatever. There shall be no service or ceremony in connection with the Sacrament so reserved, nor shall it be exposed or removed, except in order to be received in Communion, or otherwise reverently consumed." The manner in which such reservation should be made was to be determined by rules made by the Archbishops and Bishops of the Province. (c) To the Prayer of Consecration was added the Memorial or Anamnesis, and also (d) the Epiklesis—a prayer to the Holy Spirit "to bless and sanctify both us and these thy gifts of Bread and Wine, that they may be unto us the Body and Blood of thy Son our Saviour, Jesus Christ." There followed, without a break, the Prayer of Oblation of the Book of 1662.

The strongest opposition to these proposals came from (a) those who objected to the principle of *any alternative* form of the Communion Office, though they were not necessarily opposed to the revised form; (b) those who objected to Reservation in any form; (c) those who objected that the Epiklesis would suggest to the popular mind, and would be used to enforce, the idea of an actual change in the bread and wine approximating to the change defined in the doctrine of Transubstantiation (even though it might be the fact that, to the historical theologian, the Epiklesis tended in an opposite direction), (d) those who, from the opposite point of view, objected to Reservation being restricted to the Communion of the Sick only and desired it for (i.) those who, not being sick, were unable to attend the service in Church, and (ii.) as a focus for private prayer and (in some cases) for use at the service of "Devotions"—a modified form of the Roman devotion known as Benediction, (e) those who felt no security in the rule-making power reserved to the Bishops, and who, while admitting the need for reservation in large parishes, felt that if

the elements were reserved in the open church, nothing could prevent a form of "Devotions" in as much as provision for extempore prayer at Evensong was made.

Moderate Evangelicals and many Modernists were prepared to concede much that they disliked for the sake of peace and order. Anglo-Catholics, except extremists, recognized that "with certain amendments" they could support a book which was "tolerant of the Catholic standpoint." At the July (1927) session of the Assembly the Book was adopted, the voting being: For 517, Against 133. The majority vote was composed as follows: Bishops 34, Clergy 253, Laity 230; in the minority there voted 4 Bishops 37, Clergy and 92 Laity. In the House of Lords, after two days debate, the Book was passed by 241 votes to 88. Then came the bombshell of rejection by the Commons on December 15 by 238 votes to 205. There was no question that the vote was popular in the country. The speeches showed that there was the strongest feeling against the Book and, in particular, against Reservation and the proposed extention of episcopal power. The Bishops had claimed that there was no departure from the Reformation Settlement and that the Book would make for the restoration of order. The House of Commons believed the reverse. The Home Secretary pointed out that the Primate could not deal effectively with Romanizing clergy; on two notable occasions his Grace had promised to do so, but nothing had been accomplished. The Prayer Book was regarded as a surrender, legalizing the illegalities of lawbreakers. But the end was not yet. The Bishops met and decided that the rejection was due to certain "avoidable misunderstandings." They resolved to reintroduce the Book in substantially the same form with certain explanatory modifications. The changes proposed in March (1928) were: (a) Removal of the possibility of saying Matins or Evensong without praying for the King. (b) The insertion of the Black rubric from the Book of 1662 in that of 1928. (c) The undefined rule-making power of Bishops in regard to reservation was dropped, and the manner in which it was to be made was embodied in rubrics printed in the Office itself. It was advised to be made in the open Church, in an aumbry, which might not be fixed "immediately behind or above a Holy Table." (d) In the event of dispute between a clergyman and his Parochial Church Council about the adoption of the authorized alternative, the Bishops should decide between them, and before bringing into use any of the forms of service allowed in the Book the Minister must inform his Parochial Church Council. No appeal was allowed from the Bishop's decision. (e) Where there was any desire for it in the parish, Holy Communion according to the rite of 1662 must be celebrated once a month. (f) Emphasis was laid on the Bishop's duty to satisfy himself of real need for more than daily reservation before giving a licence for perpetual reservation. In this matter there was an appeal from the Bishop's decision to the Provincial Bench. (g) As it had been freely said that the demand for reservation was really due to the refusal of Anglo-Catholic clergy to celebrate when not fasting, a Declaration was inserted saying that to receive Holy Communion fasting was "an ancient and laudable custom of the Church," but that "such preparation may be used or not used, according to every man's conscience in the sight of God."

The only result of these amendments was the reduction of the measure of support for the Book. The more definite Anglo-Catholics were alienated; the Bishop of Truro, for example, withdrew his support. The mentality of the narrower type of Anglo-Catholicism was seen in the statements of *The Church Times* that priests who were now reserving would go on reserving whether they received a licence to do so or not, and in the description of the priest's obligation to consult the laity as "novel and most objectionable." Voting in the Assembly resulted in Final Approval by 396 votes to 157. Fewer voted than on the former occasion and the minority vote increased. Finally Parliament rejected the Book in June 1928, by 266 votes to 220.

FURTHER PROCEDURE

Various lines of action are now open to the Bishops. (1) They may ask for Disestablishment. Nobody has anything to gain by this. A Parliament which rejected the revised Book would not grant terms of Disestablishment acceptable to the Book's promoters. Moreover, the Book was not so unanimously desired by the Church as to make Parliament's decision an intolerable interference with the spiritual liberties of the Church. (2) To permit the adoption of the new Book on their own authority. This is a counsel of despair. Those who were recently appearing as wishing to restore law cannot give a lead in law-breaking; moreover, if it were done, the restrictions in the Book would be ignored and noone could enforce them. (3) To proceed again with the largely non-controversial sections of the Book and to abandon the alternative Communion Office and all provision for reservation. By Jan. 1929 some bishops had declared for Disestablishment and most had consulted their Diocesan Synods by a *questionnaire*, the chief questions being (*a*) whether the Bishop, in his administrative discretion, should be guided by the Book of 1928; (*b*) whether he could expect support in requiring that practices consistent neither with the Book of 1662 nor with that of 1928 should cease. In general the clergy were ready to support the Bishops on both points; but the voting in twelve dioceses showed that on point (*a*) 2,717 ayes were cast (representing ten dioceses) and 1,573 noes (representing two). On point (*b*) the twelve dioceses returned an affirmative answer, but more than a thousand votes were cast in the negative; while a majority of the Synods, but a minority of their members, approved the 1928 Reservation Rubrics.

Since 1890, in addition to the 5 new dioceses created since the Enabling Acts, 8 others have been made in England: Bristol (reconstituted, 1897), Birmingham (1905), Southwark (1905), Sheffield, Chelmsford, St. Edmundsbury and Ipswich (1914), Coventry (1918), Bradford (1919). There are now 43 dioceses in England, 6 in Wales, 7 in Scotland and 13 in Ireland. There are Churches with Provinces and Dioceses in communion with the Church of England in the United States of America, in India and Ceylon, in South Africa, West Indies, Australia, New Zealand, East and West Africa, China and Japan, besides a number of separate dioceses and missionary episcopal jurisdictions holding missions from the Archbishop of Canterbury.

For the latest year for which the figures are available, 1926, the voluntary offerings of Church people amounted to £9,818,205. Of this, £4,030,912 was given to the general expenses of the Church and £5,787,293 was given in Church collections for parochial expenses. No less than £948,894 was spent in the building restoration and furnishing of Churches, the endowment of benefices, the building of parsonage houses, and the purchasing or extending of burial grounds. Since 1924 the number of baptisms has declined at the rate of about 10,000 a year, the total of 1926 being 455,142. Confirmations have declined at about the same rate to 209,565. On Easter Day 1926, 2,272,610 people made their communion. Despite all efforts to increase clerical incomes, it appears from a Church Assembly report that the purchasing power of clerical stipends is less than it was in 1910. The Ecclesiastical Commissioners hope to raise the income of every benefice to £300 a year. In cases where the population is under 300 this promise is conditional only upon the diocese raising half the necessary increase.

The dominant impression gained from a survey of the history of the Church of England during the last forty years is one of an immense development of organizational activity, to which there has been no corresponding extension of spiritual influence. Even in organisation, such vitally necessary work as the building of Churches in the new towns which are growing up outside all our large cities is extremely difficult. The cost of land in such areas even when the authorities provide favourable opportunities of acquiring it, is generally prohibitive. The most serious issue within the Church is the need of facing the choice presented by Anglo-Catholicism and Modernism. By shirking this issue within her own borders the Established Church is destroying the main reason for her independent existence, and is becoming more and more a training ground of future converts to Rome; and while this and the dearth in quantity and quality of ordination candidates continues, the enormous and sometimes hasty activities of the Church Assembly cannot wisely be regarded as evidence of abundant life.

HISTORIC TOWNS OF ENGLAND

1. Old houses in Chester, a town dating back to the Roman occupation of Britain, and still preserving a mediaeval appearance
2. View of the old close or cathedral yard at Exeter, the county town of Devon, showing St. Martin's church (15th–16th century), and beside it Mol's Coffee house (16th century), now a shop
3. East Gate of Totnes, Devon, one of the oldest municipal boroughs in England. Totnes lies on the side of a hill and consists mainly of one long street. Below the East Gate, in the pavement, is the "Brutus Stone," where, according to legend, Brutus of Troy first set foot on English soil
4. Dunster, Somersetshire, showing the ancient castle on the hill, dating from the 11th century. The village, like many others removed from large cities, has been untouched by modern conditions
5. Thatched houses at Cockington village, near Torquay
6. Market square in Shrewsbury, county town of Shropshire. In the centre background is the old Market Hall, an Elizabethan building dated 1596. In the foreground is a statue (by Marochetti; 1860) of Lord Clive, Member of Parliament for Shrewsbury and mayor of the town in 1792. To the right, among other old houses, is a fine example of Elizabethan half-timber work

Bibliography.—Of the very extensive literature only a selection can be given here. On the general history the most convenient reference is *A history of the Church of England,* in a series of 8 vols., viz., W. Hunt, *"The English Church from its Foundation to the Norman Conquest"* (1899); W. R. Stephens, *The English Church from the Norman Conquest to the accession of Edward I.* (1901); W. W. Capes, *The English Church in the 14th and 15th Centuries* (1900); J. Gairdner, *The English Church in the 16th Century* (1902); W. H. Frere, *The English Church in the Reigns of Elizabeth and James I.* (1904); W. H. Hutton, *The English Church from Charles I. to Anne* (1903); J. H. Overton and F. Relton, *The English Church from George I. to the end of the 18th Century* (1906); F. W. Cornish, *The English Church in the 19th Century* (1910); *See* also the *Official Year Book of the Church of England* (published annually by the S.P.C.K.); *Report of the Lambeth Conference* (1920); the *Proceedings and Publications of the Church Assembly;* Sir J. Marchant (ed. by), *The Future of the Church of England;* T. G. Rogers (ed. by), *Liberal Evangelicalism* (1923); *Essays Catholic and Critical,* by a group of Anglo-Catholics (1926); H. J. R. Major, *Modernism.* (J. S. Be.)

ENGLEFIELD, SIR FRANCIS (*c.* 1520–1596), English Roman Catholic politician, was the eldest son of Sir Thomas Englefield of Englefield, Berkshire, justice of the common pleas. Francis, who succeeded his father in 1537, took the oath of royal supremacy, serving as sheriff of Berkshire and Oxfordshire in 1546–47, and accepting in 1545 a grant of the manor of Tilehurst, which had belonged to Reading Abbey. He was even knighted at the coronation of Edward VI. But the progress of the Reformation alienated him, and he attached his fortunes to the cause of the princess Mary. On Mary's triumph, he was sworn a member of the privy council like many others who owed their promotion to their loyalty. He sat as M.P. for Berkshire in all Mary's parliaments except that of April 1554, but received no higher political office than the lucrative mastership of the court of wards.

At Elizabeth's succession, he retired to the continent. He induced the pope to send a legate to persuade Elizabeth to return to the fold, and later became the close confidant of Cardinal Allen, Parsons and of those Catholics who advocated forcible intervention by Spain and the succession of the infanta. In 1592 his estates were appropriated by the crown. Englefield died most probably at Valladolid.

ENGLEHEART, GEORGE (1752–1829), English miniature painter, the great rival of Richard Cosway, was born at Kew, Surrey, in Oct. 1752, and received his artistic training first under George Barret, R.A., and then under Sir Joshua Reynolds. He started on his own account in 1773 and exhibited in that year at the Royal Academy. He continued the active pursuit of his profession down to 1813, when he retired, and his fee-book, still in existence, records the names of his sitters and the amount paid for each portrait, proving that he painted 4,853 miniatures during that period of 39 years and that his professional income for many years exceeded £1,200 a year. During the greater part of his life he resided in Hertford Street, Mayfair, London, where he lived till he retired. He died at Blackheath in 1829 and was buried at Kew.

He painted 25 portraits of George III., and had a very extensive circle of patrons, comprising nearly all the important persons connected with the Court. He made careful copies in miniature of many of the famous paintings executed by Sir Joshua Reynolds, and in some cases these constitute the only information we possess respecting portraits by Sir Joshua that are now missing. His fee-book, colours, appliances and a large collection of his miniatures still remain in the possession of his descendants.

His nephew, John Cox Dillman Engleheart (1784–1862), also a miniature painter, entered George Engleheart's studio when he was but 14 years of age. He first exhibited at the Royal Academy in 1801 and sent in altogether 157 works. He was a man of substantial means and, in his time, a very popular painter, but his health broke down when he was 44 years old and he had to relinquish the pursuit of his profession. He lived at Tunbridge Wells for some years and died there in 1862.

See G. C. Williamson and H. L. D. Engleheart, *George Engleheart* (1902). (G. C. W.)

ENGLEWOOD, a city of Arapahoe county, Colorado, U.S.A., on the Santa Fe railway, adjoining Denver on the south. It is a residential suburb, and also has various manufacturing industries, including iron works, aeroplane and film factories, and a motion picture studio. The population was 4,356 in 1920, and was estimated locally at 7,500 in 1928.

ENGLEWOOD, a city of Bergen county, New Jersey, U.S.A., opposite the north end of New York city. It is served by the Erie railroad, electric trolley and motor-coach lines and ferries. The population was 11,627 in 1920 (21% foreign-born white and 10% negroes) and was estimated locally at nearly 20,000 in 1928. It is a delightful residential suburb, rising by terraces from the valley of the Hackensack to the top of the Palisades. Until 1859, when a town was laid out, there were only a few houses here, including the Liberty Pole tavern. In 1871 Englewood was incorporated as a separate township. It was chartered as a city in 1896 and in 1899 was rechartered by special act of the state legislature.

ENGLISH CHANNEL (commonly called "The Channel"; Fr. *La Manche,* "the sleeve"), the narrow sea separating England from France and lying entirely on the broad continental shelf which extends from Europe to Greenland. Its width is about 100 m. from Ushant to the Scilly isles and 20 m. at the Straits of Dover, and its length is about 350 m. The geological affinities are well marked on the two sides, as between the Devonian and granitic rocks of Cornwall and Brittany, the Jurassic of Portland and Calvados, and the Cretaceous of the Pays du Caux and the Isle of Wight and the Sussex coast as well as either shore of the Straits of Dover. The sea broke through the narrow neck at Dover in late Pleistocene times and the channel now covers what was once a wide valley. Coastal changes are still going on; Shakespeare cliff at Dover is said to have been cut back a mile during the Christian era, while Dungeness, Chesil Bank and the beach near Tréguier are still growing. The area draining to the channel is about 8,000 sq.m. on the English side and 41,000 sq.m. on the French.

The bottom slopes fairly regularly from 20 to 30 fathoms in the Straits of Dover to 60 fathoms in the western entrance. A remarkable narrow depression, Hurd's Deep, runs for 70 m. parallel to the general direction of the channel to the north and north west of the Channel islands and approaches one of them, the Casquets, within 5 m.; 94 fathoms is found in it north of the latter point. A hole with 105 fathoms occurs a few miles northwest of Ushant. The 100 fathom line, which here is also the edge of the continental shelf, approaches to within 120 m. south-south-west of the Scilly isles; it is generally marked by ripples and a change in the colour of the water. The bottom deposits are terrigenous:—white and yellow sand, often with black specks, fine broken shell, gravel and, less frequently, patches of larger stones or of mud. The channel is an important ground for both trawlers and drift net fishermen.

Salinity and Temperature.—Atlantic water with an average salinity of 35·4 per thousand enters the English channel through the southern part of the western entrance and flows eastwards almost continuously at an average speed of 1·5 m. per day. On its way it is diluted with river water so that the salinity falls to less than 35·0 along the coast eastward of Start point and to 34·0 or less near the Isle of Wight and in the Baie de la Seine. The salinity in the centre of the Straits of Dover is about 35·1 and a tongue of water with a salinity not less than 35·0 extends some distance into the narrows between England and the coasts of Belgium and Holland. Less water escapes eastwards or is removed by evaporation than enters from the Atlantic and from rivers, and the excess turns westwards and flows northwards between Lands End and the Scilly isles. Between the Bristol channel and Ireland it sets up a great anti-clockwise (cyclonic) circulation which brings diluted Atlantic water southwards across the entrance to the channel, sometimes as far south as the Bay of Biscay; part of this is carried eastwards again. The variations in the channel are due in part to variations in the inflow from the west and in part to seasonal and meteorological changes.

The salinity of the Atlantic water in the Bay of Biscay varies with the seasons and from year to year. The maximum salinity generally reaches the British Isles in late summer or early autumn.

and the maximum inflow into the channel from this source takes place between August and the end of February. The inflow from the Irish sea occurs generally in spring and summer. The salinity in the bay was high in 1902–03 and in 1921; in 1922–23 it was low. There is no evidence that the flow up channel varies with the salinity outside, nor that high salinities in the channel are proof of high salinities in the bay. The variations in the channel are considerable, and since 1921 in particular high figures have been recorded in the southern part of the North sea and in the eastern part of the channel, due in all probability to water which has entered along the bottom. There is evidence for a two-year period in the salinity, and possibly for a period of 18½ years.

The mean annual surface temperature increases from 11–11·5° C at the Straits of Dover to about 12° C at the western entrance. The annual range falls from 10–11° C in the eastern part to 5° C in the west. The mean maximum surface temperature, 16° C, occurs along the English coast at the beginning of September and a little later on the French side. In the western area the maximum is about 15°–16° and occurs in the first third of September. The mean minimum surface temperature is 5°–6° C in the Straits of Dover and 9° off the coast of Brittany. In the eastern part of the channel the water is well mixed by tidal action over the shallows, so that the salinity and temperature are generally uniform from surface to bottom at all times. In the western area, on the other hand, mixing is far less complete, especially in the summer, when the surface layer is so heated during the day that nightly radiation cannot cool the water enough to set up vertical convection currents extending to much deeper than 10–20 metres. The water becomes divided into two layers, separated by a very thin one in which the temperature falls rapidly and the salinity often increases; this layer is known as the thermocline or discontinuity layer. Owing to this layering the average temperature in August in the western entrance is 5° C less on the bottom than at the surface. The upper layer generally vanishes in the autumn by mixing with the deeper water; if it has been unusually shallow, as generally is the case in a hot calm summer, the mean temperature in the autumn of the vertical column from surface to bottom will be lower than usual. The larger part of the seasonal variation of the temperature is due to local meteorological causes, but a sudden inflow of warm water from the west may cause a rise of temperature at a time when it is usually falling.

The Tides of the English channel, that is, the rise and fall of the water, are due to an undulation from the Atlantic which reaches Ushant on the days of new and full moon at about 3 h. 40 m. and the Scilly isles at about 4 h. 20 m. As it passes up the channel it is retarded along the shores so that the crest presumably becomes convex eastwards. The range from trough to crest is always greater on the French than on the English side, 19 to 23 ft. between Ushant and Île de Bas but only 15 to 16 ft. between Lands End and Start point.

The time of high water is progressively later as far eastward as Portland, but from this place to Selsea Bill and near Havre on the French coast there are great irregularities, which take the form of double tides or of prolonged stands at one height. They are due to the increase in range and displacement in time, relatively to the semidiurnal tidal constituents, of the quarter-diurnal constituents, presumably by the bottom configuration (*see* TIDES).

Between the Isle of Wight and the mainland double tides do not occur east of Cowes; at Cowes there is occasionally a double high water but generally only a prolonged stand at high water. West of Cowes and in Southampton Water, as far as Hurst, double high waters occur with an interval between them of about 2 hours. This interval increases progressively westward and is about 2½ hours at Christchurch, 3½ hours at Poole and 4 hours at Swanage. West of Swanage the double tide coincides more nearly with low water and at Weymouth and Portland double low waters occur, with an interval of about 3 hours between them, locally known as the Gulder. Double tides do not occur on the French coast but there is a prolonged stand at high water at Havre. In the basin eastward of the narrows high tide occurs at nearly the same time everywhere and at Dover it is at 11 h. 24 m. at new and full moon.

Tidal Streams.—When the free tidal wave of the Atlantic ocean strikes the edge of the continental shelf in about 100 fathoms it is converted into a wave of translation which gives rise to the tidal *streams*. In the English channel the flow is on the whole parallel to the axis but there is a set into bays, in which the stream turns earlier than in the offing, sometimes as much as two hours earlier. The streams are described most easily by imagining the whole area to be divided into definite portions.

The Channel stream lies between the lines joining Start point to the Casquets in the Channel islands and Beachy Head to Pointe d'Ailly near Dieppe, the Intermediate stream occupies the Straits of Dover between the last line and another drawn from the North Foreland to Dunquerque, and the Southern North Sea stream lies between this and a line from the Leman and Ower lightship off the coast of Norfolk to the Hook of Holland. The reference time is the time of high water at Dover. The Channel stream and the North Sea stream set towards one another and the straits when the water is rising at Dover and in the opposite direction as it falls, meeting and separating on a moving line within the limits of the Intermediate stream. When the water begins to fall at Dover the line is off Beachy Head and during the fall it moves eastward and reaches the eastern limit of the Intermediate stream on the North Foreland-Dunquerque line at low water. By this time the two main streams have ceased to run but the Intermediate stream is still setting westwards. When the water begins to rise at Dover both main streams set towards the straits; the North Sea stream runs with the Intermediate and the line of junction is again off Beachy Head and moves eastwards to reach the North Foreland at high water, by which time the main streams have slacked and the Intermediate stream is running eastward alone. During the next hour the main streams begin to ebb, and Intermediate stream runs with the North Sea stream and the line of separation is again off Beachy Head.

The maximum speed in the Channel stream, apart from races off headlands, is about 3½ knots in the narrows south of the Isle of Wight. In the Straits of Dover it is not as a rule over 3 knots but rises to 5 knots at places near the Goodwin Sands. The flow into the North sea is greater than that in the opposite direction by an amount which on the average would carry a drifting body 2¾ m. in a lunar day, but this flow varies greatly with the wind and is sometimes reversed. At the other entrance to the channel, westward of a line drawn from the Scilly isles to Ushant, the stream continually changes its direction through north and east and makes a complete circuit of the compass in a tidal period, setting north and east when the water is falling at Dover and south and west when it is rising there. The maximum rate is 1½ knots and there is a slight predominating flow into the channel. In the area between this line and another drawn from Start point to the Casquets in the Channel islands there is a mixed stream partaking of the character of the streams on each side of it and the maximum rate in the open is 2½ knots. There is a strong set into the Gulf of St. Malo as the water falls at Dover and in the race of Alderney between the island and the French coast the speed reaches 7 to 8 knots. As the tide rises at Dover there is a strong set round Cape Barfleur into the Baie de la Seine.

The prevailing winds are westerly and greatly preponderate over easterly winds. Gales are generally due to the passage of a depression eastwards and are commonest from October to March inclusive. Calms are rare. Fogs are frequent at all places and are commonest when anticyclonic conditions prevail, especially in the winter. The winds have considerable influence on the tidal streams, especially in the Straits of Dover.

An account of the tides of the English channel according to the dynamical theory is given in the article TIDES.

The Channel Tunnel Scheme.—Unbroken railway communication between England and France would avoid the delay and expense incurred in the transhipment of goods and many schemes have been proposed to this end. Train ferries were proposed during the first half of the 19th century and were actually used for a time during the World War. On account of a small difference between the sizes of the English and French stock, English rolling stock could be used on the French lines but it

would not be possible to use French stock on English lines. A tunnel through the chalk was proposed at the beginning of the 19th century but the scheme was first put into practical form by Thomé, who exhibited a model of his tunnel at the Great Exhibition in 1867. Later he joined forces with William Lowe, an English engineer, who also had been preparing plans. Their scheme was adopted by an international committee which asked government aid in driving an experimental drift. A commission appointed by the French ministry of Public Works reported favourably on the plan but the outbreak of the Franco-Prussian war put an end to further progress. After the conclusion of peace negotiations were resumed between the British and French Governments and an agreement was reached on such points as jurisdiction, the right of blocking the tunnel, etc. In 1875 the Channel Tunnel company obtained an act authorizing it to undertake preliminary work near St. Margarets bay and the French Submarine railway obtained permission to begin work at Sangatte. The English company failed to raise the necessary money and was bought up in 1886 by the Submarine Continental Railway company which had been formed in 1881. In 1881 the South Eastern Railway company obtained an act giving powers for experimental borings and carried out some preliminary works which were taken over in 1882 by the Submarine Continental Railway company in return for cash and shares. In 1883 a joint committee of both Houses of Parliament decided that the building of the tunnel was inexpedient and brought the scheme to an end for a time. In 1886 the Submarine company absorbed the Channel Tunnel company, and in 1887 it changed its name to "The Channel Tunnel Company, Limited" with the sanction of the Board of Trade. It promoted an unsuccessful bill in 1906. After the World War the question was again raised, but in 1924 the Committee of Imperial Defence reported against the scheme. Early in 1929 however the matter was again brought up by the Tunnel Parliamentary Committee, and both Houses were circularized for an opinion. Considerable interest was aroused and suggestions were made for a bridge across the straits of Dover similar to those of MM. Schneider and Hersent in 1889, but this is not regarded favourably by experts.

The present scheme provides for a trial gallery, which would be enlarged into two tunnels, each carrying a single railway track. Geologically the conditions are good, since the boring would be made through Chalk Marl which is impervious to water, and between Dover and Calais the conformation is uniform. The total length of the tunnel would be 34 m., 24 m. of which would be under the sea, its greatest depth being 95 ft. below the channel bed (260 ft. below sea-level).

Bibliography.—For conformation and tides: *Channel Pilot; Tides and Tidal Streams of the British Islands;* Chart 1,598 and others on larger scales; Atlas of Tidal Streams of the British Isles; all published by the Admiralty. For temperature and salinity: H. W. Harvey, *Rap. et procès-verbaux,* vol. vi., xxxvii.; *Bull. Suppl.* (1908); all published by the Cons. Perm. Internat. pour l'Exploration de la Mer (Copenhagen). For Tunnel: *Blue Books* "Correspondence . . .," Commercial No. 6 (1875) and C. 3,358 (1882); *Rep. Joint. Sel. Comm. . . . Houses of Lords and Commons . . .* (1883); *Brit. Assoc. Reports* (1882), p. 404, Hawkshaw, and (1899), p. 750, Boyd Dawkins; Rodakowski, *The Channel Ferry* (London, 1905); Parl. Debates, vol. 175, 1782 (July 1924); memoranda by Channel Tunnel Company. (D. J. M.)

ENGLISH COLLEGIATE STYLE, in architecture, a style developed in the colleges of Oxford and Cambridge during the 15th, 16th and 17th centuries. It is characterized by the persistence of Gothic tradition (*see* Gothic Architecture) with only slight modifications due to the creeping in of Renaissance elements (*see* Renaissance Architecture); the grouping of buildings around quadrangles, entered by an arched gate in a tower, the combination of many window lights into one mullioned and transomed opening; parapets, sometimes battlemented; long rows of similar small gables; bay or oriel windows; and the frank exterior expression of the various types of halls, large rooms and small sleeping rooms which form the college. In general it is based on the domestic architecture of the time, in earlier examples resembling late Gothic manors, and in the later, the larger Elizabethan or Jacobean country houses; during the 17th century classic motives, often of great quaintness and crudeness, are general in the detail of doors, etc., without seriously changing the spirit of the entire style.

ENGLISH HISTORY. The general account of English history which follows does not cover the period anterior to the landing of St. Augustine. For this reference should be made to the article Britain. The nature of early English culture and social order, the origin of the first Germanic kingdoms founded in England, and the process of conversion which brought them into the fellowship of Western peoples, form the subjects of other articles. Much of the detail of their subsequent history is described in the biographies of the leading men of this period. It remains to indicate something of the process which created the first centralized monarchy in western Europe out of the group of separate and often hostile kingdoms between which England was divided at the beginning of the 7th century.

I. THE ESTABLISHMENT OF ENGLISH UNITY

From the outset there was one powerful factor making for unity. The Angles, Saxons, and Jutes may have been distinct in origin, but there can be no doubt of their close relationship. No fundamental differences separate the culture of Angles and Saxons, and the superior arts and crafts of the Jutes in eastern Kent and in the Isle of Wight were acquired probably during temporary residence in Frankish territory immediately before their migration to Britain. The language differences between these peoples can only have been slight in the 7th century. All three peoples, for example, used the same general stock of personal names, and recent investigation of local nomenclature has brought out an essential similarity in words denoting places of settlement and natural features throughout Britain. Kent indeed stands apart from the rest of England in legal custom, agrarian organization, and at a later time to some extent in language. But Kent, save for the reign of its greatest king, Ethelbert, was never an important kingdom, and though the distinctive features of its society may have intensified its particularism they did not seriously complicate the general uniformity of the English culture of the earliest period.

The Ancient Dynasties.—English history between the 6th and the 9th century is nevertheless the record of incessant wars, and for long afterwards jealousies between kingdoms once independent remained politically important; for instance, it was long before the men of the great Mercian kingdom finally acquiesced in the overlordship of the kings of Wessex. To the ordinary peasant these jealousies arose from no profounder source than instinctive distrust of strangers. His view was confined to the region of which he had personal knowledge, and we have no reason to believe that a West Saxon *ceorl* from Berkshire felt more antipathy to a Mercian of his own class than to another West Saxon from Somerset. The rivalry which was dangerous to peace, and delayed the accomplishment of English unity, was rivalry between kings. The number of separate dynasties established in England, each with its own reputed descent from ancient gods, was very remarkable. Among the Anglian peoples of the north and east there can be traced separate royal lines ruling in Bernicia, between Tees and Forth, in Deira, between Humber and Tees, in Lindsey, in East Anglia, and in Mercia, along the middle Trent. No doubt the degree of nobility implied by the pedigrees asserted by these families varied greatly. No royal house in England claimed so illustrious a descent as the kings of the Mercians, who included among their ancestors men who had ruled the Angles in their continental home. But every royal house asserted its descent from Woden, and therefore, none could acknowledge a fundamental superiority in any rival.

It has been argued often that the influence of the church counteracted this tendency, that the authority of the archbishop of Canterbury set an example which was ultimately followed in the temporal sphere. There is a measure of truth in this opinion. A great archbishop like Theodore of Tarsus was the effective ruler of the church everywhere among the English people. But no other archbishop was a man of Theodore's quality, and after 734, when an independent archbishopric of York was created, the organization of the church was a serious obstacle to the unifica-

tion of England. Moreover the administration of the church was closely adapted to the contemporary political divisions of the land. The typical bishop of the 7th century was bishop of a kingdom and counsellor of its king. It was only an exceptional man who in such a position could work for the establishment of a wider unity than prevailed in the world which alone he knew.

Reasons for West Saxon Supremacy.—On the eve of the Norman Conquest, Edward the Confessor, heir of the West Saxon dynasty, was the only king recognized in England. It is natural to attribute the ultimate supremacy of the West Saxon line to the unusual ability of kings like Alfred, Edward the Elder, and Athelstan, but they would never have achieved their place in history had it not been for the previous extinction of all competing dynasties. At the end of the 8th century, a highly competent observer, the Northumbrian scholar Alcuin, then resident in France, remarked that scarcely any men were left of the ancient stock of English kings. Two generations later, the West Saxon dynasty alone survived. The permanent establishment of a new royal line under the conditions which prevailed in the 9th century was an impossible task. A mere noble, however eminent his ancestry, never received the instinctive respect accorded to a man of royal birth. On three occasions before the Norman Conquest a man who was not of this class obtained temporary recognition as king, but on each occasion the attempt led to disaster. With the disappearance of the ancient dynasties the king of the West Saxons became the natural lord of kingless men elsewhere in England. Alfred and his successors had the ability to make their lordship a reality.

The Bretwaldas.—But long before Alfred's time individual kings had succeeded in establishing a degree of authority over other rulers which in the 8th century had brought the unity of England within measurable distance of realization. From the 5th century onwards it had been the custom for every king south of the Humber to acknowledge the authority of a common overlord. The title borne by these early overlords, the famous style of Bretwalda (*q.v.*) was vague, and of poetical origin, but the powers which it implied were real. When, for example, Edwin, king of the Deirans and Bernicians, had obtained recognition at Bretwalda from the kings of the south, he anticipated for a moment the position of a later king of all England. He could summon other kings to bring their followers to join him in war, he could take tribute from them, and his safe conduct ran in their countries. It is true that no Bretwalda before the 9th century could hand on his position to his son and successor. He had won it by his own skill and reputation in war, and it inevitably ended with him. Nevertheless the habit of obedience to a common overlord did more than any other custom to break down the isolation of the different southern kingdoms, and the succession of the Bretwaldas is the one thread which holds together the confused history of England between the invasion and the age of Bede.

Northumbria and Mercia.—The kings beyond the Humber stood outside the confederacy of which the Bretwalda was the head. Northumbria went its own way, brought only by exceptional circumstances into any intimate connection with southern England. It is probable that Northumbrian separatism goes back to the very age of the Anglian settlement, that two independent hosts of invaders used the Humber as their boundary. Be this as it may, this separatism long delayed the unity of the English peoples. In the ecclesiastical sphere its effects are still visible, for the archbishoprics of Canterbury and York represent the group of southern kingdoms which in the age of the conversion had owned a common overlord and the northern peoples who lay outside his authority. It was inevitable that sooner or later the isolation of Northumbria would be challenged. At first it seemed that a Northumbrian king might establish permanent supremacy over the south. Three Northumbrian kings of the 8th century, Edwin, Oswald and Oswiu were able to obtain recognition as Bretwalda from their southern contemporaries. When, for example, Cynegils king of Wessex gave Dorchester-on-Thames to Birinus for his bishop's seat, Oswald king of the Northumbrians was associated as overlord in the gift. But Edwin was overthrown by a British reaction in 633, Oswald fell before Penda, the heathen king of the Mercians, and though Oswiu defeated Penda in 655, and attempted to govern Mercia through Northumbrian nobles, his authority, not only in Mercia but throughout the south, was ended by a Mercian revolt in 658. It is significant that the next overlord of the southern English, Wulfhere king of the Mercians, attempted to enforce his supremacy over Northumbria by leading an army drawn against its king. Wulfhere was defeated, and for a generation the overlordship of the south itself was in abeyance. It was revived by Ethelbald king of the Mercians (715–757), and after him was carried to its highest point by his cousin Offa, the strongest king who hitherto had appeared in England.

Offa and His Successors.—In a sense, the reign of Offa marks the culmination of the old English monarchy. Later centuries produced more famous kings, such as Alfred, Athelstan and Edgar, but by their time a new racial element had been introduced into England by the Danish settlements of the 9th century, and the authority of the last old English kings over the Danelagh (*q.v.*) was dependent on the good will of its inhabitants. In the time of Offa, England was virtually homogeneous in race. Of the rival dynasties some were extinct, others had come to accept a position permanently subordinate to the head of the Mercian house, while the Northumbrian kingdom was collapsing into anarchy. Under these conditions, Offa was able to create a dominion which approximated far more nearly than is generally realized to a kingdom of all England. He was king of the Mercians, and Mercia in his time was by far the strongest of English kingdoms. But he was also overlord of the southern English, and in his hands overlordship was passing visibly into direct rule. The heirs of the surviving southern dynasties were his men, attended his courts and sought his confirmation of their grants of land. He dealt at his will with land within the subject kingdoms, and brought Northumbria under his control by giving a daughter to its king. Little is known of the detailed history of his reign. No chronicle has survived from his time, and the most important materials for its history are the charters by which he granted land to his followers or to churches which enjoyed his patronage. And one of these documents has unique importance, for in it Offa styles himself *rex totius Anglorum patriae,* "king of all England."

This is the first occasion on which this famous style is known to have been employed. But the kingdom of all England which Offa claimed to rule was not identical with England of the present day. In the far south-west Cornwall was still virtually independent, its subjection to the kingdom of Wessex belonging to the next generation. In the far north the Northumbrian kingdom still stretched to the Firth of Forth, and Lothian remained English for two centuries after Offa's time. Between the English and the Britons on the border of what is now Wales Offa's memory is still preserved by the great earthwork which bears the name "Offa's Dyke." This long entrenchment, the greatest public work in early English history, was undoubtedly intended as an artificial boundary line against the Britons of the West. The wars of later centuries created a different boundary but the dyke remains a remarkable illustration of the reality of the power possessed by the greatest king of the age before the Danish wars.

Egbert of Wessex.—Both Offa and his son Egfrith died in 796, and a remote cousin named Cenwulf became king of the Mercians. He reigned until 821, maintaining the integrity of the Mercian kingdom without the wider authority which had belonged to Offa. With his successor Ceolwulf (821–823), the direct line of the Mercian dynasty ended, and after a brief interval the overlordship of the southern English was won by Egbert king of Wessex, who alone among the English rulers of his day could claim direct descent from the kings of the migration time. It was to this fact that he owed his opportunity. At his accession Wessex was an unimportant kingdom, and Egbert himself, unlike Offa, remained to the last an insular figure. But his reign marks an important stage in the unification of England. As the heir of the last of the archaic English dynasties he obtained ready recognition as overlord in the smaller kingdoms of the south,

Kent, Sussex and Essex. In a battle fought at a place named Ellandun in north Wiltshire in 825 he overthrew Beornwulf, king of the Mercians, and the East Angles deliberately chose him as their protector against Mercian aggression. Four years later, he received the submission of the Mercians themselves, and immediately imposed his overlordship on the Northumbrians. By the close of his reign he had obtained a position virtually identical with that which Offa had held.

The Danish Wars.—This fact was destined to influence the whole course of early English history. Already in Egbert's reign, isolated companies of vikings were visiting the English coasts, and within thirty years of his death in 839 an organized army was ravaging the whole land. The real importance of Egbert's career lies in the fact that he was able to make the king of Wessex supreme over all other English peoples before the whole fabric of English society was attacked by the new invaders from the east. It was to the king of Wessex, that the men of Mercia, East Anglia, and even Northumbria turned when their own royal lines had been overthrown. And it so happened that the West Saxon royal house produced in Alfred, the youngest grandson of Egbert, the greatest military leader whom the Scandinavian raiders ever met in western Europe.

Alfred.—Alfred's aim was to prevent the settlement of Wessex by Scandinavian invaders, and in this he was helped by fortune. So long as the Danish armies kept together they could compel the West Saxons, like every other English people, to buy peace from them. But the weight of Danish attack fell on Mercia and Northumbria, and a great part of the original army which entered England in 865 had permanently settled between Tees and Welland before the remainder of the host attempted the conquest of Wessex ten years later. In 877 they overran all Wessex, and drove Alfred into the inaccessible stretches of higher ground along the river Parret. His victory at Edington in Wiltshire in the following year is one of the battles which have influenced the course of history. Had he been defeated, Wessex would have been settled by the invaders, and all England would have become a Scandinavian colony. The battle of Edington decided that the West Saxon dynasty should survive. When Alfred died in 899 he could be described with truth as "king over all the English people except the part that was under the power of the Danes." The next generation saw his dynasty establish its overlordship over the descendants of the Danish settlers everywhere in England.

With the reign of Alfred English history enters upon a new phase. The Danish army defeated at Edington moved in 879 to East Anglia, and settled this region as their former companions had already settled the country between Welland and Tees. Smaller groups of settlers who acknowledged the East Anglian king as their lord had established themselves in the south-eastern midlands. From the estuary of the Thames to the Rere Cross on Stainmore eastern England was a Danish land when Alfred died. For a hundred years afterwards the Danes in England retained much of their original military organization. In the 10th century men commonly spoke of the "army" of Northampton or Leicester when they referred to the men of Northamptonshire or Leicestershire. The most formidable of these "armies" was that established in the country round York, which at first had a king of its own, and raided English territory from time to time. But the kings of York never brought the more southerly Danes to accept their authority, and in the warfare of the next generation the initiative, almost from the first, rested with the English of Wessex and English Mercia.

Conquest of the Danelaw.—The conquest of Scandinavian England and its annexation to the West Saxon kingdom spread over twenty years. It would have been a remarkable achievement if the king of Wessex had been the ruler of an English people united in feeling and in traditions. But the ancient independence of Mercia and Northumbria was not yet forgotten. The English of Northumbria, threatened by Danes on the south and Scots on the north, naturally looked to the king of Wessex as their protector. The particularism of the Mercians was more serious. Barely a century had passed since Mercia had been the dominant kingdom in the land. Fortunately for the unity of England, Alfred had established a trusted noble, named Ethelred, as ealdorman of the Mercians, and had given him Aethelflaed, his eldest daughter, in marriage. The most remarkable feature of the wars which followed Alfred's death is the unbroken loyalty of Ethelred and his wife to their lord, Aethelflaed's brother, king Edward the Elder. Ethelred died in 910, but for the next seven years his widow cooperated with her brother in a gradual encroachment upon Danish territory which ended, after her death, in the acceptance of Edward as lord by all the Danes in England. Long after this time a clear distinction was maintained between the English of Wessex and of Mercia. In the 12th century the customary law of Mercia still differed in important points from that of Wessex. But after the reign of Edward the Elder the Mercians were normally content to form part of an English kingdom whose head was the West Saxon king.

Norwegian Invasions.—While Edward and Aethelflaed were engaged in their great campaigns against the Danes, a new element was being added to the complex of races which was to form the English people. In the first decade of the 10th century, a considerable number of Norwegian adventurers from Ireland invaded the north-west of England. From the region which now forms the shires of Cumberland and Westmorland the new settlers passed easily across the western hills into the North Riding of York, where their memory is still preserved by many place-names of definitely Norwegian character. In the next decade, the leader of the vikings of Waterford, Ragnall O'Ivar, made himself king of York, and thus began a connection between Northumbria and Ireland which threatened the whole work of Edward and Aethelflaed. But for the time it had little political result, and in 919 when Edward received the solemn submission of all the men of Northumbria, "English, Danes, Northmen, and others," of the kings of the Scots and of the Britons of Strathclyde, Ragnall also became his man.

Athelstan.—The position won by Edward the Elder was maintained by his son Athelstan, the most brilliant figure among the Old English kings. Early in his reign he expelled the Norse dynasty, then in possession of York, and brought the city and its dependent territory under his direct rule. Under him, relations between the king of Wessex and the Scandinavian nobility of the north and east became friendly, and numerous earls of Danish name can be traced at his court. He enforced a real overlordship over the Welsh princes of his day, and made Cornwall an integral part of the West Saxon kingdom. Abroad, his reputation was great. His sisters were married to the chief continental rulers of his time —to Otto king of the Germans, afterwards Emperor, to Charles king of the West Franks, the descendant of Charlemagne, and to Hugh duke of the Franks, the ancestor of the house of Capet. From time to time he intervened in French affairs, protecting Breton refugees driven from their homes by Norman invasion, and giving hospitality to Louis, the heir of the Carolingian dynasty. He enters for a moment into Norwegian history, for there is no reason to doubt the ancient tradition which asserts that Hakon, son of Harold Fairhair, the creator of the Norwegian kingdom, was brought up at Athelstan's court. Not since Offa had there been an English king who played so considerable a part in the eyes of men across the seas.

It also fell to him to win one of the greatest battles ever fought between an English and a Scandinavian host. In 937 Anlaf Guthfrithson, king of Dublin, in alliance with Constantine, king of Scots, penetrated far into England, but were utterly defeated by Athelstan at a place not now to be identified, then known by the name of Brunnanburh. Less important historically than Alfred's victory at Edington, the battle of Brunnanburh greatly impressed contemporaries. A memory of it was preserved in Norse tradition, and it gave occasion for a poem which reveals with singular fidelity the merits and defects of late Old English poetic style. The details of the battle, as of most Old English battles before the last fight of Hastings, are lost. Its most significant feature is that the Northumbrian Danes, who had been the greatest danger to the English monarchy in the days of Athelstan's father were not present with Anlaf and his Scotch allies.

The reign of Athelstan has moreover a place in the history of

English administration. Reference has been made from time to time to those charters by which the Old English kings granted estates to the nobles and churches of their kingdom. The series of these documents, which begins in the seventh century, is broken in the latter part of the long reign of Edward the Elder. It begins again under Athelstan and is never afterwards interrupted. The interest of Athelstan's charters does not lie in their subject matter, but in the highly technical form in which they are composed. There can be no question that Athelstan kept a body of clerks in attendance at his court, who developed rules of composition, a set of formulae, a technique of draftsmanship, to which there is nothing comparable in the royal charters of any earlier time. In other words it is in the reign of Athelstan that evidence for the existence of something which may be called a civil service first appears in England. The West Saxon monarchy was beginning to develop the rudiments of an administrative system.

Final Conquest of Danish Mercia.—Athelstan died in 939. The reign of his brother and successor Edmund is marked by a curious episode which shows how easily the monarchy, after a generation of laborious consolidation, could still be shaken by attack from without. In his first year, Anlaf Guthfrithson, the king defeated at Brunnanburh, invaded England again, became master of York, and compelled the king to agree to a partition of the country. Edmund accepted Watling Street as his boundary against Anlaf, and thereby acquiesced in the destruction of all the work of Edward the Elder. Anlaf's death in the following year gave Edmund an opportunity of recovering his position in the midlands, and in 942 he conquered all Mercia as far as the Northumbrian border, and including the five boroughs of Lincoln, Stamford, Leicester, Nottingham and Derby, which had been, and long continued to be the centres of Danish influence between Welland and Humber. A contemporary poem, fortunately preserved in the Old English Chronicle, brings out the important fact that the men of these boroughs regarded their conquest by Edmund as a deliverance from heathen bondage. The later development of the English monarchy was first assured when the descendants of the Danish settlers of the 9th century decided to throw in their lot with the king of Wessex against the new aggressive viking power established on the Irish coast.

Wessex and Northumbria.—In the following years a succession of ephemeral kings of Norse origin can be traced at York. The last of them disappeared in 954, when Edred, Edmund's brother, became, like Athelstan before him, the immediate lord of York and Yorkshire. Henceforward this region appears as an earldom, highly independent, but never breaking quite away from its allegiance to the king of Wessex. It was only on rare occasions that the latter intervened in Northumbrian affairs. He had little land beyond the Humber, and Northumbrian nobles rarely appeared at his court. But the Northumbrian earls were his men; he appointed the archbishop of York and the bishop of the country beyond Tees, whose seat became fixed at Durham before the century was over. The Northumbrian currency bore his name, and his writ ran in the north. The last kings of the West Saxon dynasty were lords of Northumbria in something more than name.

Significance of the Danish Settlement.—The years which passed between the accession of Edward the Elder and the death of Edred had been momentous for the development of a united England. They had witnessed the acceptance of Christianity by the descendants of the Danish settlers of Alfred's time, the failure of the Norse invasions from Ireland, and the recognition of the head of the West Saxon royal house as king of all England. Politically, the unity of England was accomplished by the end of this period. But this achievement, which in itself is one of the most remarkable facts in all English history, has often led historians to underestimate the significance of the Danish settlement of the previous century. Long after this period, long, indeed, after the Norman Conquest, the Danes in England remained in language, law and society a race apart. They were an intensely conservative people, tenacious of their ancient customs, jealous of interference from without. The region of their settlement, known from the 10th century onwards as the Danelaw, was sharply distinguished from Mercia and Wessex by peculiarities of customary law which long survived the overthrow of the Old English kingdom itself. In social order, the Danelaw was marked by the existence of large masses of independent peasants who never underwent the manorial discipline which converted the free *ceorls* of the south and west into the serfs of mediaeval economy. Even in the 13th century innumerable peasants of Scandinavian ancestry were still disposing freely of their small tenements by gift, sale or exchange without hindrance from their lords. In language, the Scandinavian speech of the Danelaw has left a permanent impression on the dialects of this region, and its personal nomenclature remained intensely Scandinavian until, late in the Middle Ages, the continental names which came in with the Norman Conquest found in Danish England the acceptance which they had long received in the South. Few things are more remarkable in English social history than the consistency with which the Scandinavian population of the North and East resisted the influences which were making for the assimilation of their customs to those prevalent in the South and West. The England which William of Normandy conquered formed a single monarchy, but it contained two races.

Weakness of the Monarchy.—The single monarchy itself was far stronger in appearance than in reality. Only four years after the disappearance of the last Norse Northumbrian king, the whole region north of Thames broke away from Wessex. Edred, who died in 955, left two young sons, Edwy and Edgar, of whom the former succeeded him. The most notable feature of his brief reign is the large number of grants of land made by royal charter to individual nobles. No reign in all early English history produced so many of these grants as the five years of Edwy's rule in Wessex. It is probable that Edwy was trying by their means to attach important persons to himself against his brother. In any case, a revolt of which Edgar was in name the head broke out in 958, and the men of Northumbria, East Anglia and Mercia chose Edgar for their king. In the following year Edwy died and the unity of England was restored by Edgar's reception as king in Wessex. But the episode shows that there was little cohesion as yet between the four great territorial units which comprised the English kingdom of the 10th century.

The Reign of Edgar.—The reign of Edgar is often regarded as marking the highest point of effective power reached by the Old English monarchy. In a sense this opinion is justified. Edgar inherited a wide dominion created by earlier kings, his reign was a time of peace for the greater part of England, and he was able to impose his overlordship upon the Celtic princes beyond the English border. But he was not a constructive ruler like Edward the Elder or Athelstan, and when their achievements are remembered his reign appears something of an anticlimax. In part his reputation is due to the evil time which fell upon England in the next generation, but it owes still more to his lavish patronage of the church, and to his encouragement which he gave to the great men, Dunstan, Ethelwold, and Oswald, who in his reign were reviving monastic life in England. A competent ruler, he left little mark upon the development of the monarchy.

Ethelred "the Unready."—But throughout the forty years which followed his death there was a singular lack of competence in high places. His eldest son, Edward "the Martyr," was murdered before he could prove either ability or incompetence. His second son, Ethelred "the Unready," appeared to contemporaries as the very type of an inefficient ruler, and there is no reason to attempt a reversal of their judgment. His troubles were not, indeed, of his own making. In the second year of his reign there began a succession of Danish raids upon England, which curiously resemble in their sporadic character and their wide range the visitations previous to the coming of the great army of Alfred's time. For more than a generation the monarchy, which Ethelred's great predecessors had created, resisted with remarkable firmness. Though there was treachery among men in high command, inefficient military organization and over-strained financial resources, the sense of political unity was never completely lost, and no trace of any tendency towards separatism is to be found in the Danes in England. The attitude of the men in charge of the great provincial governments is equally significant. Some of them,

notably Edric Streona the ealdorman of Mercia, obviously considered it their right to make terms with the enemy as their own interest might dictate, even if this involved the betrayal of their men in the field. But none of them made any attempt to secure political independence, or to revive the ancient kingdoms of which they were the immediate rulers. The kingdom of England was conquered, but it escaped disintegration.

Danish Conquest of England.—The particular invasion which ended in conquest was precipitated by one of king Ethelred's innumerable changes of policy. He took into his service a large force of vikings who were the men of Swegn Forkbeard, king of Denmark. Swegn replied by invading England in the summer of 1013. He fixed his headquarters at Gainsborough in Lindsey, and there received the submission of the Northumbrians, of the men between Humber and Welland, and of every shire north of Watling Street. Before the year was over he was recognized as king everywhere in the land; Ethelred was in exile at the court of his brother-in-law, Richard duke of Normandy and the war was over for the moment. But Swegn died early in 1014, and the English nobility recalled Ethelred from Normandy. In the struggle which followed, the English protagonist was Edmund, Ethelred's eldest surviving son, called Ironside "for his courage" according to a poem of the next generation. On the death of Ethelred in the spring of 1016 part of the English nobility recognized Edmund as king, the rest adhered to Cnut, the second son of Swegn, and a brief period of indecisive fighting was ended by a treaty according to which Edmund received Wessex as his kingdom while Cnut took the rest of England. Soon afterwards Edmund died, Cnut was received as king in Wessex, and for nearly a generation England formed part of a vast dominion which included Denmark, a vague overlordship over the Slavonic peoples along the Baltic, and for a time the kingdom of Norway.

Cnut.—This singular episode had remarkably little influence on the later course of English history. The wealth and ancient civilization of England made it the centre of Cnut's incoherent empire. He ruled as an English king, with greater military power behind him than any of his predecessors, but governing with the same instruments which they had used. Individual Danes and Norwegians received high office from him. For a time Northumbria was governed under him by Eric son of Jarl Hakon of Norway, one of the heroic figures of Norwegian saga. But already in the early part of his reign Cnut was appointing Englishmen to important provincial governments. The two powerful families whose rivalry fills the reign of Edward the Confessor, the house of Godwine of Wessex and that of Leofric of Mercia, both owed their position to Cnut. He granted to all his English subjects of free condition the first charter of liberties in English history. The laws which he issued form the most detailed exposition of Old English legal custom which has survived, and formed the basis of the law which prevailed in England under the Norman kings. The grants of land which, in moderation, Cnut made to his Danish followers are drawn up according to English models of composition, and his coinage follows earlier English types. To Englishmen he soon became the pattern of a good king. By the eve of the Norman Conquest "Cnut's law" had become a synonym for a form of government in which ancient and approved custom was observed.

Recall of the West Saxon Dynasty.—Nevertheless it was impossible that England and Denmark should be united permanently. The wide dominion of Cnut defied geographical facts, and only a king of singular ability and good fortune could hope to maintain it. The political connection between England and Denmark only survived its creator for seven years, and on the death of Harthacnut, son of Cnut and Emma of Normandy, widow of Ethelred II., the English nobility recalled the heir of the house of Wessex.

Edward the Confessor.—The reign of Edward the Confessor, the heir thus restored, is the prelude to the Norman Conquest. Edward, who had grown up at the Norman court, throughout the first part of his reign gave every opportunity for the spread of Norman influence in England. He organized his household according to the contemporary French model, granted estates to individual Norman knights, and patronized Norman churchmen. As his life drew on, and he found himself childless, he undoubtedly came to wish that his cousin William, duke of the Normans, might follow him as king of England. Towards the middle of the reign he even promised the succession to William in explicit terms, and if Edward had died at this time the duke of Normandy might have become king of England without serious dispute. But the moment passed, and thenceforward until the end of the reign English influences represented by Godwine, earl of Wessex, and by Harold his son predominated at court. In 1052, Godwine and Harold, who had been exiled in the previous year, returned to England with a large force, and compelled the king to acquiesce in their restoration. The Norman archbishop of Canterbury was driven into flight, and a protégé of Godwine, named Stigand, was placed in his seat, an event which had momentous consequences, for it threw the continental advocates of ecclesiastical order into opposition to the régime which Godwine and Harold represented. Godwine died within a year, Harold succeeded to his wealth and office, and events gradually opened out to him the possibility of succession to the crown itself. He was far from commanding the support of all the English nobility. The earls of Mercia were the rivals of his house, and he had little influence in the North, the establishment of his brother Tostig as earl of the Northumbrians leading to a revolt which drove Tostig into exile and produced a Norwegian invasion. But when King Edward died at the beginning of 1066 Harold was immediately recognized as king by the nobles present in London and crowned by the archbishop of York.

The Norman Conquest.—Meanwhile the duke of Normandy had never lost sight of the prospect of succession to the English throne. The male line of the house of Wessex survived King Edward in the person of his cousin Edgar, the grandson of King Edmund Ironside. But Edgar was only a child; William represented the family which had protected the royal house of England throughout the time of Danish rule, he was King Edward's kinsman, and in his own duchy he had consistently favoured the rising movement of ecclesiastical reform which as yet had found little influence beyond the Channel. It was easy for him to obtain the moral support of the Papacy when the time came for an invasion of England. Moreover under the conditions which prevailed in the 11th century the exact relationship between a king and his successor was not a matter of the first importance. The essential task before any candidate for kingship was to obtain recognition from the leading men of the kingdom in view. Kinship was a title to recognition, and the thread of kindred which connected William and Edward the Confessor, exiguous as it seems to the modern student gave to William a fundamental advantage over his rival.

FIG. 1.—THE DEATH OF HAROLD AT THE BATTLE OF HASTINGS, DEPICTED ON THE BAYEUX TAPESTRY

Stamfordbridge and Hastings.—In the event, the Norman victory of 1066 was essentially due to accidental circumstances. Harold was at once accepted as king in the south; he met no overt opposition from the rival family of the earls of Mercia, and he succeeded in conciliating the Northumbrians. His chance of defence against the threatened Norman invasion was destroyed by a sudden and formidable invasion of England from the Scandinavian north. Harold Hardrada, king of Norway, who had inherited an indefinite claim to the English throne in virtue of a treaty between his predecessor and Harthacnut, the last Danish king of England, adopted the cause of Tostig, the exiled earl of Northumbria, entered the Humber and occupied York. His defeat at Stamfordbridge by Harold of England ranks with the battles of Edington and Brunnanburh among the events which ruled that England should not form part of the Scandinavian world. But the Norwegian invasion called King Harold from the south at the very time when invasion from Normandy was imminent. William of Normandy landed at Pevensey without serious opposition, Harold engaged him in battle seven miles north-west of Hastings with the

survivors of Stamfordbridge and the men who had joined him during a hurried march from York, and in a single day the cause of English independence was lost.

Position of William the Conqueror.—It was an ancient and wealthy kingdom of which William thus became the lord. Its integrity had survived all the disasters which had fallen on it in the ninety years since King Edgar's death. But the royal authority had become dangerously weak during the last generation, and the effective power now resided, not in the king, but in the rulers of the great earldoms called into being by the administrative necessities of an earlier time. King Edward had enjoyed the royal title, and possessed a royal demesne which made him the greatest landowner in the country, but on any grave occasion he was helpless without the support of such men as the earls of Wessex, Mercia or Northumbria. They on their part treated him with the respect due to the head of his ancient house, received their offices from his hand, and from time to time attended his court and gave him counsel. Nevertheless to the men of their respective governments it was they rather than the king who were responsible for public order, for the defence of the land, and for the maintenance of familiar custom. The unity of England, achieved by the great kings of the 10th century, had become very superficial when Edward the Confessor died.

At this point William of Normandy exercised a determining influence on English history. He was lord of the land by conquest, and from his time the king's court became the centre of English government. To him the ancient distinction between Wessex, Mercia and the Danelaw had no political significance, and successive revolts enabled him to break up the great earldoms. He was compelled to create compact military lordships in regions where especial danger threatened. The earldoms of Chester, Shrewsbury and Richmond closely resembled Norman countships, and the "rapes" of Sussex were castleries of French pattern. But each of these new military governments was given to a man whom William had reason to trust, and in his time their privileges did not impair its integrity. Indeed, it would be easy to exaggerate the centralization of the government in William's reign. Feudal custom expected a lord to do justice to his men in his own court, and the king was not yet required to intervene in private disputes between persons of modest station. William was representative of his generation, and knew instinctively the sphere in which his authority could be exercised without challenge. To him belonged an unquestioned initiative in policy, the right to send his ministers into every part of the land to ascertain his interests, and a claim upon the advice and support of his barons in any undertaking which he might plan. It was to him that his barons owed their position, and though irresponsible nobles might sometimes rebel, the definite opposition between crown and baronage which colours English history in the later middle ages could not arise while the Anglo-Norman monarchy was itself on the defensive. The new power which William had created had many enemies. It was a direct challenge to the kings of Norway and Denmark, it was regarded with great suspicion in France, and for a generation the possibility of a native rising was very real. Throughout the reigns of the Conqueror and his sons there was an essential community of interest between the king and his barons, and it was from this that the strength of the Anglo-Norman monarchy was ultimately derived.

Character of Anglo-Norman History.—With the Norman Conquest English history assumes a new character. The unity of England was now assured, and the political history of the Anglo-Norman reigns seems curiously insignificant after the great events which culminated in the Conquest. The military adventures of William II. led to no decisive issue, and the prolonged peace which Henry I. gave to England meant that contemporary writers found few events of moment to record. The reign of Stephen is crowded with incident, but there is little coherence in the recorded succession of events, and the feudal anarchy which marks this period is in retrospect only a brief exception to the general trend of English history. The interest of the years which followed the Conquest lies outside the course of political or military incident. It is to be found in the organization of the English administrative system, the influence of feudal principles upon English society, the relations of the church in England to the Papacy, the emergence of England from isolation on the fringe of the western world into participation in the movements then influencing continental Europe.

By the end of 1070 the Norman rule had become finally established in England. French barons had received the lands forfeited by English rebels, and the North had been terrorised by the recent devastation of Yorkshire and northern Mercia. William was unwilling to allow military power to any man of English descent and the native element in the Anglo-Norman aristocracy, though strong in the North, had little political importance. But the Norman Conquest was not a national migration, and the modification of English law, language and social custom through French influence was a very gradual process. Fifty years after the Conquest the traditions of the time before that event were still strong, and Englishmen lived in the reign of Henry I. under what was still in substance and procedure essentially Old English law. To the last, England never became a mere province of the French speaking world.

The Monarchy and the Baronage.—The danger which confronted the Anglo-Norman kings was not English disaffection but the drift towards baronial independence characteristic of contemporary feudalism. In the forty years which followed the Conquest there were four serious baronial rebellions, each essentially the outcome of aristocratic jealousy towards a strong monarchy. Until the succession to the throne itself fell into dispute between Stephen and the empress Maud, the common interests of crown and baronage were always strong enough to prevent the disaffection of individuals from wrecking the settlement established by William I. But all the kings of this period were alive to the danger. In 1085 William himself received the homage of all the landholders of any account in England, thereby insisting that the vassal's fidelity to the king overrode his duty to his immediate lord. William II. understood the mental attitude of the irresponsible baron, and attracted into his own service many of the landless knights of northern France on whom the plotters of rebellion always relied. Henry I. was interested in the business of government, and under him the Anglo-Norman monarchy reached a degree of organization which placed it above the attack of any possible combination of barons. Under him, perhaps for the first time in its history, England enjoyed unbroken peace for a generation. With his death the direct line of the Norman kings ended, his successor ruined the national administration by alienating the church, and the dangerous forces latent in the constitution of feudal society at last found vent. The ensuing phase of feudal anarchy was brief and the inevitable reaction lasted long. The power of the crown, restored by Henry II., was never generally attached until the generation which had known the disorders of Stephen's time had disappeared. But the history of the years of confusion illustrates what might easily have become the normal condition of society under the new French dynasty and the baronage which it has established in England.

Anglo-Norman Administration.—If the authority of the Anglo-Norman kings depended in the last resort on the loyalty of the baronage, it was exercised through an administrative system

which centred upon the king's court. William I. had inherited more than the nucleus of an executive organization from his English predecessors. Already before the Norman Conquest England had developed a national system of taxation, and the unrivalled series of English financial records begins in William's reign with a document written in English which proves the earlier existence of a definite organization for the receipt of the royal revenue. The king's writ of later times goes back to an Old English model, and it was in English that the Conqueror in his earliest years normally addressed his subjects of every race. With few exceptions, the king's clerks of his reign are obscure people, but they and their successors were able to carry through the compilation of the greatest record in mediaeval history. From every point of view Domesday Book (*q.v.*) was a momentous achievement. It incorporates the result of a national survey which was itself a political event of the first importance, and its bearing upon the origins of English mediaeval administration is equally significant. It proves the existence in the king's service of a large body of clerks, skilled in administrative routine, and able to reduce to order the verdicts of innumerable local juries drawn from every part of England between the Tees and the Channel. The creation of specialized offices within this body was only a question of time, and early in the next century the history of the English departments of state begins with the appearance of the Exchequer, the central financial bureau destined to carry down to modern times the tradition, and much of the technique, of the Anglo-Norman administration.

Church and State.—In mediaeval history it is never easy to draw a clear line between the respective spheres of church and state, and in the history of England it is long before any definite separation becomes evident. The leading churchmen of pre-Conquest England had been immersed in secular business, ecclesiastical pleas were commonly treated in secular courts, and the king had been far more effectively the ruler of the church than of the state. With the Norman Conquest, church and state began to fall apart. Under William I. and his friend Lanfranc, archbishop of Canterbury, the organization of the church in England was remodelled according to continental ideas, the bishops gained a more direct authority over their clergy, and jurisdiction over matters affecting the cure of souls was transferred from the ancient hundred moot to the new bishop's court. But the conscious opposition between the monarchy and the church belongs to a later time. On questions of ecclesiastical policy William and Lanfranc were of one mind. Lanfranc realized that the work of ecclesiastical reform needed the support of the royal authority, that the deliverance of the church from subjection to the feudal world could only be accomplished by the exercise of the king's supremacy. It was not until the church itself was secure that a movement towards independence could arise within it.

The intimate alliance which William and Lanfranc had founded was broken under their successors. William II., himself as irreligious as the wildest baron of his time, placed a saint in the see of Canterbury. Intellectually among the greatest of mediaeval churchmen, Anselm (*q.v.*) throughout his primacy felt himself an alien in England. New questions of ecclesiastical politics, on which English churchmen were themselves divided, awaited his decision. Upon the most urgent of these questions, the great controversy over Investitures (*q.v.*), Anselm and Henry I. reached a compromise. But their success did not affect the essential fact that the ancient unity of church and state in England was incompatible with the new ideal of ecclesiastical independence from which the investiture controversy itself had arisen. For a time the inevitable conflict between church and state was postponed. Anselm's successors, archbishops Ralf and William were mainly occupied with the detailed work of ecclesiastical administration and reform. Under Theobald of Bec, the next archbishop, the church was for a time the only institution in the land which maintained the great Norman tradition of organized government. Throughout the reign of Stephen, the church and its ministers possessed a degree of power which made the assertion of general principles irrelevant. It was Theobald's successor, Thomas Becket, who challenged at last the ecclesiastical authority of the crown.

II. THE DEVELOPMENT OF CENTRALIZATION

The essential achievement of the Anglo-Norman kings had been the creation of an administrative system, centred on the royal court, which under Henry I. had destroyed all but the greatest baronial franchises and extended its influence into every department of local government. In the reign of Stephen, a disputed succession and civil war broke the continuity of this development. In some respects the position attained by the monarchy under Henry I. was never completely restored until Henry VIII. had imposed his supremacy upon the church in England. In the last resort, Stephen had owed his throne to papal recognition, and the popes of the next age maintained and indeed increased the influence thus won.

Henry II. and Thomas Becket.—Although Henry II. in the end carried the English monarchy to a point of power never before attained, his achievement even in the temporal sphere was long delayed by the spirit of feudal independence which had found expression in the anarchy. Fortunate in all his ministers save one, a single error in judgment destroyed for ever his chance of re-establishing the relations between church and state which had prevailed under the Anglo-Norman kings. The whole of his reign thereafter was coloured by the fact that Thomas Becket (*q.v.*), Henry's fellow worker as Chancellor, became the uncompromising champion of ecclesiastical privilege as archbishop. Through his opposition Henry's original aim of bringing all his subjects within the sphere of royal justice became unattainable. Hoping at first to move by the establishment of general principles through the settlement of individual cases, he was compelled by the opposition of Becket to propose to his bishops in the Constitutions of Clarendon (*q.v.*) of 1164 a comprehensive definition of the relationship which he wished to see established between church and state. The archbishop's flight prevented the settlement of the general questions raised by the Constitutions. His murder in 1070 produced a reaction which gave to the Pope a direct influence on the administration of ecclesiastical justice in England, and secured for the clergy immunities which still complicated the administration of English justice long after the middle ages.

Innovations in Criminal Procedure.—But even in the difficult years of Becket's exile and the crisis which followed his death the work of centralization was going on. Aided by the most remarkable group of ministers which ever served an English king, ministers drawn alike from the feudal nobility of every rank and from the new administrative class which had arisen earlier in the century, Henry was able to undertake the systematic reconstruction of the administration without alienating the mass of the English baronage. In 1166 in the Assize of Clarendon for the first time the king took from the individual the responsibility of instituting legal process against persons suspected of certain of the graver forms of crime. Such crimes in future came before the king's judges. Jurisdiction over them was taken from the sheriff and the feudal baronage alike. Ten years later the Assize of Northampton added further crimes to the list and made punishment more severe. By these ordinances what was in effect a new procedure was introduced into English criminal law. The jury or sworn inquest, which was henceforward employed to inform the king's judges about crimes or accusations of crime, was no new thing. Ever since the Norman Conquest it had been used for the ascertainment of royal rights and for the occasional settlement of disputes between individuals, but there had not been any place for it in ordinary legal procedure. Its regular employment could only be secured by such deliberate innovation as the royal ordinance of 1166. The change was sudden, but it was not pushed to an extreme, for the individual still had the right of appeal, and the native ordeal and the Norman duel still survived. As years went on the king's judges appeared almost annually in the shires, and gradually men came to realize the fundamental superiority of the king's justice. Gradually they attracted to the king's courts criminal business which formerly would have fallen to the feudal courts or the ancient courts of shire or hundred. Offences of little moment could be brought before the king's judges by the mere assertion of the plaintiff that they had been committed in

contempt of the king's peace.

New Forms of Action.—Simultaneously the king was extending the influence of his justice in the sphere of civil procedure. From the early years of his reign he was enforcing the doctrine later expressed by his chief justiciar, Rannulf de Glanville in the formula "No one need answer in his lord's touching his free tenement without the writ of the king or his chief justiciar." He rigorously followed up complaints of default of justice. He devised the first examples of those forms of action which dominated the law of real property until the nineteenth century was well advanced. Determined by the verdict of a local jury instead of the uncertain operation of archaic forms of procedure, these possessory assizes steadily grew in popularity. For those who desired a rapid settlement, even if it might be reversed on some future occasion, these summary processes were sufficient. For those who wished a final settlement in accordance with the verdict of a jury and in the king's court Henry provided a more solemn if less expeditious process in the Grand Assize which enabled the tenant of the land at issue to avoid the uncertain event of a judicial duel. It is not surprising that Henry's court was invoked by his free subjects of every condition. The essential step had now been taken towards the centralization of justice in England.

The King's Court and Local Officers.—The men through whom this work was carried out, the justices of Henry's court, were not experts in law alone. They were the king's executive officers to be employed on any task that the king might assign to them—administrators of the king's estates, keepers of the royal castles, financial officers of the crown. Above all they formed the essential link between the central government and the shires. Through them the king maintained control of the sheriffs; many of them were sheriffs themselves. Through visits of the justices on circuit the central court became informed as to the condition of the country. The ordinary freeman became acquainted with the personnel of the king's court and was continually reminded that there existed a power in the land greater than the feudal magnate who was his lord or the sheriff who presided over the ancient assemblies of his shire. On one great occasion in 1170 Henry instituted, through persons despatched from his court, an enquiry into the conduct of all local officers, and many sheriffs were dismissed as a result of this investigation. The independence of the local officer which had wrecked earlier Continental experiments in centralization was now destroyed. The king's court had become the instrument of all government in England.

It is in this development of royal power in England rather than in the magnitude of Henry's territorial position in western Europe that the greatness of his reign lies. Nevertheless, he was the strongest king of his time, inferior in rank to the Emperor, but far superior to him in material resources. His official title, King of England, Duke of Normandy and Aquitaine, count of Anjou, imperfectly expresses the significance of his position. A duke of Aquitaine was lord of one of the richest regions of the whole West whose traditions were more ancient than those which centred round the French monarchy itself. In Normandy it was not forgotten that his father's house had been the hereditary enemies of the Norman dukes. In this lay the weakness of his continental position, a weakness that the king of France knew only too well how to exploit. Conscious of the diverse traditions of the regions over which he ruled, Henry was unwilling to encourage local particularism by creating appanages for his sons. Their resentment at exclusion from power was perhaps inevitable, though they showed little sense of responsibility or family solidarity. Fortunately for Henry their political capacity was small. Their rebellion in 1174, though supported by the kings of France and of Scotland, failed alike in England and France. After fifteen years of continuous disaffection they brought Henry's reign to a close in confusion and distress, his empire passing entirely to Richard, his rebellious heir.

The Reign of Richard I.—The reigns of Richard I. and John form a single period. A real break in continuity comes between the reigns of Henry II. and Richard I. with a change in the great officers of state, of whom the Treasurer alone remained. But a more essential change lay in the different spirit with which the new king regarded his responsibilities. Henry II. desired above everything to establish his authority upon financial stability and a well ordered land. With Richard I. begins a long series of kings who failed to accommodate their policy to their financial resources. Richard cared for England only as a source of the money needed for his military adventures and only on two occasions appeared in England. Nevertheless, England was as well administered under him as under his father, for he commanded the services of a younger generation of officials who had received their training in his father's court. Perhaps the most important feature of his reign is the fact that the mass of his subjects came in his time to associate strong government with the king's ministers, not with the king himself.

Richard came to England in 1189 to be crowned and to raise money for the crusade to which he was already committed. Nothing illustrates more clearly the prosperity which England had reached under Henry II. than the way in which the country met the unprecedented financial demands of Richard. To the new king the settlement of England made necessary by his impending departure was a matter of finance. He sold offices and privileges to individuals, charters to towns, and his favour to persons whose loyalty was suspect.

The Count of Mortain and the King's Justices.—The unity of England itself was threatened by the settlement of 1189. The youngest son of Henry II., John count of Mortain, was a person to be conciliated, and he received from Richard an appanage of unprecedented extent. Six counties, Nottingham and Derby, Somerset and Dorset, Devon and Cornwall, were withdrawn from the control of the central government and placed under John's lordship. They accounted no longer at the royal exchequer but at that of the count of Mortain. He held also the honours of Lancaster, Tickhill, Peverel of Nottingham, Wallingford and Eye, which were among the greatest feudal lordships in England. In his wife's right he possessed the great inheritance of the earls of Gloucester, which gave him the formidable marcher principality of Glamorgan. Nevertheless, John was dissatisfied; he had not been recognized as his brother's heir and the greatest castles in his domain were held by his brother's officers. Inevitably he became a centre of disaffection, and the unpopularity of Richard's chief minister, William de Longchamps bishop of Ely, chancellor, Justiciar and Papal Legate, brought over the leading members of the king's council itself to the side of John. In the autumn of 1191 the Chancellor was driven from England by a movement led by John, and his place was taken by Walter archbishop of Rouen, who had been sent from abroad by Richard. Until January 1193, when the news reached England that Richard had fallen into captivity on his return from crusade, the archbishop carried on the government of England in Richard's name. Then in alliance with the king of France John broke into rebellion, and thenceforward until Richard himself returned to England early in 1194 and captured the last castles which held out for his brother the peace of the land was never completely re-established. But even in these difficult months, the representatives of Richard never lost control of the situation. They were even able in 1193 to collect and despatch to Germany a large portion of the ransom demanded by the Emperor for Richard's release. The administrative system which Henry II. had devised remained unshaken by threatened war with France, by the shock of the king's imprisonment, and by the rebellion of the man who stood nearest to the succession.

Hubert Walter, Archbishop of Canterbury.—The war with France in which Richard was thenceforward engaged belongs to French rather than to English history. In England, Hubert Walter archbishop of Canterbury, first as justiciar and afterwards as chancellor maintained the traditions of Henry II.'s court. If his immediate duty was to raise money and knights, his chief interest lay in improving governmental practice at Westminster and in the country. The great eyre of 1194 is a landmark in English administrative history; it created a new and permanent office, that of coroner, it set up new machinery for dealing with lands escheated into the king's hand, and instituted the department of government which soon became known as the

Exchequer of the Jews. The office of justice of the peace can be traced back upon one of its many lines of development to an edict issued by Hubert Walter in 1195. He reorganized the Chancery and began the systematic keeping of official records. His influence survived until the whole administrative system collapsed in the troubles which preceded the issue of Magna Carta.

King John.—Hubert Walter and his younger contemporary, Geoffrey fitz Peter, form a link between the reigns of Richard I. and John. With Richard's death and John's accession in 1199 the personality of the sovereign once more became the dominant factor in English politics. John has received hard measure from historians, and he deserved much that they have said against him. In personal conduct, like his father, he fell below the low standards of contemporary life, but he was a man of ability, interested in the routine of government and in the technique of law, and with real appreciation of forces which as yet most rulers of his time regarded with suspicion. It was not mere financial necessity which made him a patron of towns; long after his death the cities of Aquitaine regarded him as a benefactor. It was not weakness that made him call into occasional consultation men of less than baronial rank, there was something inevitable in the disasters which fell upon England in his time. He suffered from baronial reaction against efficient bureaucracy, from popular resentment against the heavy taxation incurred through his brother's spirited policy. Above all he was thrown by circumstances into opposition to two of the greatest mediaeval statesmen. As a young man Philip Augustus king of France had reduced the veteran Henry II. to submission, and though Richard I. had held his own against him it had been at a heavy price. In Innocent III. John faced a pope who brought wholly unusual qualities to the establishing of papal supremacy in western Europe. It was something more than the weakness of its king that made England a vassal state and brought upon it the first foreign invasion since 1066.

John and the Papacy.—The first significant event was the French conquest of Normandy in 1204. It marks the end of the system which had prevailed since the Conquest, by which the greatest feudal families were powerful on either side the Channel. It made possible the growth of an English national feeling, but its immediate consequence was a certain alienation of the baronage from the king. The next year saw the beginning of the events which were to lead to the central crisis of the reign. Archbishop Hubert Walter died on July 13, 1205, and a disputed election gave Innocent III. an unexpected opportunity. The struggle which began with the pope's nomination of Stephen Langton to the primacy and the refusal of John to accept him lasted till 1213. For long, the king gained rather than lost by the quarrel; he enjoyed the profits of the lands of those ecclesiastics who obeyed the Pope, and thus enriched, he was able to enforce his supremacy on Ireland and Wales and take hostages from the king of Scots. But his strength was more apparent than real. After his personal excommunication in 1209 he was left with but two supporters among the bishops, John, bishop of Norwich, absent ruling Ireland, and Peter des Roches, bishop of Winchester. Threatened by French invasion at the instigation of Innocent III., unnerved by current rumours of coming doom, uncertain of the attitude of some of his barons, John submitted unconditionally to the Pope in 1213. He promised to hold his kingdom as a papal fief and to pay a yearly tribute to his overlord. On his part, the Pope discountenanced the French invasion of England.

Magna Carta.—The coming of Stephen Langton as archbishop of Canterbury marks not only the end of the struggle between John and the Pope, but the beginning of the events which culminated in the issue of the charter in 1215. The course of these events, the place of the charter in English history, and the war which followed its issue are described in the article Magna Carta. Had John lived there is little doubt that he would have quelled the barons and their French allies, but his victory would have meant the triumph of absolutism, the indefinite postponement of constitutional experiment. With his death (Oct. 19, 1216) the authority of the crown was disassociated from the personality of an unpopular king.

Failure of the French Invasion.—John's inheritance passed to his son Henry, a child of nine, whose supporters established a regency under William Marshall, earl of Pembroke, the oldest and most generally trusted of the English earls. With him were associated Gualo, the papal legate, Hubert de Burgh, the Justiciar, Peter des Roches, most faithful of John's ministers, and Falkes de Breauté, the ablest of his mercenary leaders. In less than a year they had secured the withdrawal of the French invaders and brought over to Henry's side the great mass of the English baronage. Two notable victories marked the war, the battle which secured the relief of Lincoln castle, held for Henry by the heiress of its hereditary castellan, and a naval victory in the straits of Dover which prevented reinforcements from reaching the French army in England. On Sept. 11, 1217 the war ended in the treaty of Lambeth.

Henry III.—Till the Marshall's death in 1219 the interests of the young king were protected by the coalition of able men who had taken control of affairs. Gualo had been replaced by Pandulf as legate and on his deathbed it was to the care of the Pope in the person of Pandulf that the Marshall entrusted Henry. The return of Stephen Langton, driven from England by his unwillingness to excommunicate the rebel barons at the papal command, meant Pandulf's recall. But the necessity for the legate's presence was over. Much work remained to be done, but it was work of settlement. There were elements of unrest in the country represented by the mercenaries, in particular Falkes de Breauté, and the younger nobles, such as William de Forz, count of Aumâle, who were unwilling to accept a time of peace. But these forces of anarchy were easily suppressed. Within two years of the treaty of Lambeth, the administrative system, dislocated by war was once again in full operation. The elaborate series of records which illustrate in minute detail the government of England under Henry III. begins in his earliest years.

Hubert de Burgh and Peter des Roches.—From 1219 until 1232 Hubert de Burgh, the Justiciar, was ruler of England. He was far more powerful than any previous Justiciar, but was throughout confronted by the rivalry of Peter des Roches, bishop of Winchester and Henry's former tutor. The situation was still difficult, and Hubert was generally held responsible for the insecurity of the Welsh marches and the ill success of English policy in France. His resistance to papal demands upon the English church did not counteract the unpopularity which he earned from the older nobility by his determination to secure a strong territorial position for himself and his family. At length his domination became insupportable to the king, to whom he did not even allow the possession of a privy seal. In 1232 Peter des Roches triumphed. A supporter of his became Justiciar without political power; his nephew, Peter de Rivaux controlled the royal household, and the royal household through its executive department, the wardrobe, controlled the administration.

Regarded as Poitevin adventurers, the bishop of Winchester and his associates were even less popular than Hubert had been, their very loyalty to the king and their interest in administrative reform alienating the baronage. The leader of the opposition, Richard, earl of Pembroke, was killed in Ireland through their contrivance, and Edmund Rich, the new archbishop of Canterbury, brought about their dismissal. With the fall of Peter des Roches the last great figure of the minority disappears from English politics, and Henry's personal rule began (1234). Two years later Peter de Rivaux held office in the wardrobe again, though with less apparent power. His reappearance coincides with the coming of many foreign relatives of the new queen, Eleanor of Provence. It was followed by the gradual replacement of English by foreign clerks in the wardrobe and by six years of far-reaching administrative reform.

Character of Henry's Government.—Mainly interested in the efficiency of the central government this new school of administrators cared little for the welfare of the subject. Its very efficiency threatened baronial privilege, and the ancient feudal council was losing its power to a new body of intimate advisors of the king. In 1247 a second Poitevin invasion began with the appear-

ance in England of the king's half brothers and their dependents. Despite the financial reforms which had been recently introduced, the king was short of money. He could not check the rising power of Llewelyn of Wales, a war with France in which he entered in 1242 was expensive and ineffective, and requests to the baronial council for help were met with demands for the observance of the Charters. Meanwhile papal demands for money from the English church and papal provisions to English benefices were becoming insupportable to all alike.

The king himself was anxious to play a leading part in European politics. His sister's marriage to the Emperor, Frederick II., in 1235 produced an anomalous situation. Frederick was the declared enemy of the papacy and Henry had begun his reign as a papal protege. The ally of each antagonist, Henry was too weak to follow an independent policy. He depended on papal mediation for the maintenance of tolerable relations with the king of France. Harassed as he was by the inadequacy of his resources and by baronial opposition, Henry's ambition nevertheless led him in 1255 to accept from the pope the kingdom of Sicily on behalf of his infant son Edmund. Thus, if indirectly, was produced the great crisis of his reign.

Simon de Montfort.—Throughout all the difficulties of Henry's personal rule, his brother Richard earl of Cornwall had acted as the trusted mediator between crown and baronage. In 1257 he left England to attempt with papal support to win the position of emperor. He was a moderate man respected by all parties, and his withdrawal was unfortunate. Henceforward for eight years English politics are dominated by a very different personality. Coming to England with no other advantages than an agreeable address and a claim to an English earldom which might well have been ignored, Simon de Montfort had become one of the leading barons in the land. He had secured the earldom of Leicester and married the king's sister. The only successful governor of Gascony since the time of Richard I. he was ill rewarded by the king and joined the extreme section of the baronial opposition.

The Provisions of Oxford and the Baronial Council.—In April 1258 an opposition party was formed, and the Great Council, or Parliament, as it was coming to be called, put off the consideration of supplies until a plan of reform was agreed upon. Parliament was summoned to meet at Oxford in June, and there the Provisions of Oxford (*q.v.*) were drawn up, arranging for the government of the country by a baronial council. The baronial aim was to control and reform the central administration and the king's household, and to correct the abuses of local government. But before either object could be undertaken it was necessary to arrange peace with Wales and France. It is interesting to note that Simon de Montfort delayed negotiations with France because he would not give up his wife's remote claims to a share in the Norman and Angevin territories until he had been compensated by Henry III. But the main interest of the period from 1258 to 1261 lies in the baronial attempts to reform local administration; their preoccupation with the details of local government prevented them from dealing with the central administration. The office of Justiciar was revived, though with judicial rather than executive functions. The Treasury, Chancery and Household were little affected by the revolution. Peter de Rivaux lost office once more, but less important men, Englishmen or foreigners retained their positions. Even in regard to local government the baronial task was not easy. It was made more difficult by the fact that the king was working all the time for the recovery of power, and the baronial party was divided on the question of baronial franchises. Simon de Montfort won much popularity by insisting against the earl of Gloucester that not even the greatest baronial "liberty" should exclude the officers of the central government. Edward, the king's son, who was himself, as king, to legislate against both the oppressive local officer and the tyrannical baron was already showing the direction of his sympathies. He supported the movement among the "bachelors," the unestablished members of feudal families, who demanded the extension of the reforms. The result was the issue of the Provisions of Westminster in Oct. 1259 defining the relations between royal and seignorial justice and strengthening the power of the council over the government. For a time in 1259 Edward was closely allied with Simon de Montfort. But by the influence of his uncle, Richard king of the Romans, Edward was led to see that he was endangering royal authority for the sake of an idea, and brought back into his natural association with the king. A papal Bull of April 13, 1261, absolved Henry from his oath to observe the Provisions of Oxford. Neither side was anxious for war, and for a time the wider questions at issue were postponed to a struggle over the details of local government. The earl of Gloucester died in the next year. His heir was an enthusiastic follower of de Montfort, so that Simon's leadership of the opposition was unquestioned. On the other hand Edward had won the marchers to the royal side. The inevitable war was averted for a time by an agreement to submit to the arbitration of Louis IX. of France, but despite the oaths taken by the leaders of each party to abide by the king's judgment, his decision against the Provisions of Oxford meant war. The king was stronger in 1264 than he had been in 1258, for many of the greater barons had now come over to him. Simon's followers were mainly young men full of ideas of reform, and his close alliance with Llewelyn of Wales was as much a source of weakness as of strength. Nevertheless, the battle of Lewes on May 14, 1264, was a defeat for the king, who was captured. England was again, as in 1258, ruled by a baronial committee, but Earl Simon was now its dominating spirit.

The Parliament of 1265.—The Model Parliament of 1265, to which Earl Simon owes his fame, was intended to buttress a position which he knew was none too strong. It was essentially a meeting of his supporters. Its place in English history is due to the simultaneous summons of borough representatives and knights of the shires. This precedent was not, indeed, immediately or uniformly followed. The assemblies of the next thirty years still have the experimental character of those which had preceded Simon's parliament. They were still in the transition stage between the feudal council and the national parliament. It was not till 1295 that Edward I., in acute need of national support reverted to the example set by Earl Simon. Contemporary opinion could not have realized that a new instrument of government was in process of development, but the germ of the future House of Commons lay in the Parliament of 1265.

Renewal and End of War.—When the Parliament met Simon's power was beginning to fail. He quarrelled publicly in Parliament with the earl of Derby, and even the earl of Gloucester's loyalty broke under the strain of accommodation to his arbitrary behaviour. Edward escaped from supervision, raised forces in the Welsh marches, and at Evesham in August 1265 Simon was killed and his army annihilated. The uncompromising attitude of the royalists deterred the baronial leaders from submission, and the war was now resolved into the desperate defence of isolated centres of resistance, Kenilworth castle, the Isle of Axholme, and the Isle of Ely. Among the royalist barons there was difference of opinion as to the policy to be adopted towards those implicated in the rebellion. The marcher lords would have proceeded to all extremes against them, but the more moderate opinion represented by the earl of Gloucester prevailed upon Edward and in 1267 terms of settlement were reached and expressed in the *Dictum de Kenilworth.* A long series of judicial visitations at length determined the penalties to be inflicted on individual rebels and settled the ownership of much land and many chattels seized in the war.

Earl Simon's Place in History.—Simon de Montfort should be remembered less for his work as a founder of the English Parliament than for the fact that despite his personal ambition, his arbitrary character, and his insistence on his personal rights he aimed at the reform of real abuses and tried to impose upon the holders of the great feudal franchises a responsibility not less than that of the king. Good work was done in the time of baronial rule, which led directly to the administrative achievements of the reign of Edward I. The Statute of Marlborough (1267) and the statutes of the next generation work out in detail ideas which had already found expression under the régime of Simon. The nature of the central government as it had been elaborated during the minority and personal rule of Henry III., was not materially changed by the rebellion. The reign had seen the development of

the Wardrobe into a principal department of state, and baronial jealousy of this new household bureau in no way affected its administrative importance. Edward I. found in it the essential instrument of his rule. This continuity is only natural. The shadowy personality of Henry III. was always influenced by someone stronger than himself. At first Hubert de Burgh, then Peter des Roches, and in the last years of the reign the future Edward I. dominate English politics. Three years after the settlement at Kenilworth the royal power was so fully re-established that Edward could leave England upon Crusade. His father died in his absence on Nov. 16, 1272. (F. M. S.)

III. DEFINITION, EXPANSION AND REVOLT

The succeeding reign was perhaps the most important epoch of all English mediaeval history in the way of the definition and settlement of the constitution.

Edward I.—Edward was a remarkable figure. He was a great soldier, and his conquest of Wales forms one of the most notable military achievements in mediaeval history. But the real importance of his reign lies in the spheres of legal and constitutional development. Edward understood the problem that was before him, the construction of a working constitution from the old ancestral customs of the English monarchy plus the newer ideas that had been embodied in the Great Charter, the Provisions of Oxford, and the scanty legislation of Simon de Montfort. He loved power, but saw that he could best secure the loyalty of his subjects by assenting to so many of the new constitutional restraints as were compatible with his own practical control of the policy of the realm. He was prepared to refer all important matters to his parliament, and in the Model Parliament of 1295 reproduced the essential features of de Montfort's assembly of thirty years before—the summons of borough representatives simultaneously with the summons of knights of the shires. The constitutional quarrels of his reign were conducted with order, because the king knew his limitations, and because his subjects trusted to his wisdom in times of crisis. Edward indeed was a man worthy of respect, if not of affection. His private life was grave and seemly; his chosen ministers were wise and experienced officials, whom no man could call favourites or accuse of maladministration. He was sincerely religious, self-restrained and courteous, though occasionally, under provocation, he could burst out into a royal rage. He was a good master and a firm friend. Moreover, he had a genuine regard for the sanctity of a promise, the one thing in which his father had been most wanting. It is true that sometimes he kept his oaths or carried out his pledges with the literal punctuality of a lawyer, rather than with the chivalrous generosity of a knight.

Edward's reign lasted for thirty-five years. The first period of it, 1272–90, was mainly notable for his great series of legislative enactments and his conquest of Wales. The second, 1290–1307, contains his long and ultimately unsuccessful attempt to incorporate Scotland into his realm, and his quarrels with his parliament.

Statutes of Westminster and Gloucester.—The changes made by Edward in constitutional law by his great series of statutes were intended to strengthen the power of the crown by judicious and orderly definition of its privileges. The great enactments start with the First Statute of Westminster (1275), a measure directed to the improvement of administrative details, which was accompanied by a grant to the king of a permanent customs-revenue on imports and exports, which soon became more valuable to the royal exchequer than the old feudal taxes on land. In 1278 followed the Statute of Gloucester, an act empowering the king to make inquiry as to the right by which old royal estates, or exceptional franchises which infringed on the royal prerogative of justice or taxation, had passed into the hands of their present owners. This inquest was made by the writ *Quo Warranto,* by which each landholder was invited to show the charter or warrant on which his claims rested. The barons were suspicious, for many of their customary rights rested on immemorial and unchartered antiquity, while others were usurpations from the weakness of John or Henry III. They showed signs of an intention to make open resistance; but to their surprise the king contented himself with making complete lists of all franchises then existing, and did no more; this being his method of preventing the growth of any further trespasses on his prerogative.

Statute of Mortmain.—Edward's next move was against clerical encroachments. In 1279 he compelled Archbishop Peckham to withdraw some legislation made in a synod called without the royal permission—a breach of one of the three great canons of William the Conqueror. Then he took the offensive himself, by persuading his parliament to pass the Statute of Mortmain (de religiosis). This was an act to prevent the further accumulation of landed property in the "dead hand" of religious persons and communities. The more land the church acquired, the less feudal taxation came into the royal exchequer. For undying corporations paid the king neither "reliefs" (death duties) nor fees on wardship and marriage, and their property would never escheat to the crown for want of an heir. The Statute of Mortmain forbade any man to alienate land to the church without royal licence. A distinct check in the hitherto steady growth of clerical endowments began from this time, though licences in mortmain were by no means impossible to obtain.

Second Statute of Westminster.—The great group of statutes that date from Edward's earlier years ends with the legislative enactments of 1285, the Second Statute of Westminster and the Statute of Winchester. The former contains the clause *De Donis Conditionalibus,* a notable landmark in the history of English law, since it favoured the system of entailing estates. Hitherto life-owners of land, holding as subtenants, had possessed large powers of alienating it, to the detriment of their superior lords, who would otherwise have recovered it, when their vassals died heirless, as an "escheat." This custom was primarily harmful to the king—the greatest territorial magnate and the one most prone to distribute rewards in land to his servants. But it was also prejudicial to all tenants-in-chief. By *De Donis* the tenant for life was prevented from selling his estate, which could only pass to his lawful heir; if he had none, it fell back to his feudal superior. Five years later this legislation was supplemented by the statute *Quia Emptores,* equally beneficial to king and barons, which provided that subtenants should not be allowed to make over land to other persons, retaining the nominal possession and feudal rights over it, but should be compelled to sell it out and out, so that their successor in title stood to the overlord exactly as the seller had done. Hitherto they had been wont to dispose of the whole or parts of their estates while maintaining their feudal rights over it, so that the ultimate landlord could not deal directly with the new occupant, whose reliefs, wardship, etc., fell to the intermediate holder who had sold away the land. The main result of this was that, when a baron parted with any one of his estates, the acquirer became a tenant-in-chief directly dependent on the king, instead of being left a vassal of the person who had passed over the land to him. Subinfeudation came to a complete stop, and whenever great family estates broke up the king obtained new tenants-in-chief. The number of persons holding immediately of the Crown began at once to multiply by leaps and bounds. As the process of the partition of lands continued, the fractions grew smaller and smaller, and many of the tenants-in-chief were ere long very small and unimportant persons. These, of course, would not form part of the baronial interest, and could not be distinguished from any other subjects of the crown.

Statute of Winchester.—The Statute of Winchester, the other great legislative act of 1285, was mainly concerned with the keeping of the peace of the realm. It revised the arming and organization of the national militia, the lineal descendant of the old *fyrd,* and provided a useful police force for the repression of disorder and robbery by the reorganization of *watch and ward.* This was, of course, one more device for strengthening the power of the crown.

Conquest of Wales.—During the first half of his reign, Edward was often distracted by external matters. He was, on the whole, on good terms with his first cousin, Philip III. of France;

the trouble did not come from this direction, though there was the usual crop of feudal rebellions in Gascony. Nor did Edward's relations with the more remote states of the continent lead to any important results, though he had many treaties and alliances in hand. It was with Wales that his most troublesome relations occurred. Llewelyn-ap-Gruffydd, the old ally of de Montfort, had come with profit out of the civil wars of 1263–66, and had won much land and more influence during the evil days of Henry III. Friction had begun the moment that Edward returned from the crusade. Llewelyn would not appear before him to render the customary homage due from Wales to the English crown, but sent a series of futile excuses lasting over three years. In 1277, however, the king grew tired of waiting, invaded the principality and drove his recalcitrant vassal up into the fastnesses of Snowdon, where famine compelled him to surrender. Llewelyn was pardoned, but deprived of all the lands he had gained during the civil war, and restricted to his old North Welsh dominions. He remained quiescent for five years, but busied himself in knitting up secret alliances with the Welsh of the South, who were resenting the introduction of English laws and customs by the strong-handed king. In 1282 there was a sudden and well-planned rising, which extended from the gates of Chester to those of Carmarthen; several castles were captured by the insurgents, and Edward had to rescue the lords-marchers with a large army. After much checkered fighting Llewelyn was slain at the skirmish of Orewyn Bridge near Builth on Dec. 11, 1282. On his death the southern rebels submitted, but David his brother continued the struggle for three months longer in the Snowdon district, till he was taken prisoner. Edward beheaded him at Shrewsbury as a traitor, having the excuse that David had submitted once before, had been endowed with lands in the Marches, and had nevertheless joined his brother in rebellion. After this the king abode for more than a year in Wales, organizing it into a group of counties, and founding many castles, with dependent towns, within its limits. The "statute of Wales," issued at Rhuddlan in 1284, provided for the introduction of English law into the country, though a certain amount of Celtic customs was allowed to survive. For the next two centuries and a half the lands west of Dee and Wye were divided between the new counties, forming the "principality" of Wales, and the "marches" where the old feudal franchises continued, till the marcher-lordships gradually fell by forfeiture or marriage to the crown. In 1287 and 1294–95 there were desperate and widespread revolts, which were checked only by the existence of the new castles, and subdued by the concentration of large royal armies. In 1301 the king's eldest surviving son Edward, who had been born at Carnarvon in 1284, was created "prince of Wales," and invested with the principality, which henceforth became the regular appanage of the heirs of the English crown. This device was apparently intended to soothe Welsh national pride, by reviving in form, if not in reality, the separate existence of the old Cymric State. For four generations the land was comparatively quiet, but the great rebellion of Owen Glendower in the reign of Henry IV. was to show how far the spirit of particularism was from extinction.

Expulsion of the Jews.—Some two years after his long sojourn in Wales Edward crossed to Bordeaux in 1286, and abode in Guienne for no less than three years, reducing the duchy to such order as it had never known before, settling all disputed border questions with the new king of France, Philip IV., founding many new towns, and issuing many useful statutes and ordinances. He returned suddenly in 1289, called home by complaints as to the administration of justice by his officials, who were slighting the authority of his cousin Edmund of Cornwall, whom he had left behind as regent. He dismissed almost the whole bench of judges, and made other changes among his ministers. At the same time he fell fiercely upon the great lords of the Welsh Marches, who had been indulging in private wars; when they returned to their evil practice he imprisoned the chief offenders, the earls of Hereford and Gloucester, forfeited their estates, and only gave them back when they had paid vast fines (1291). Another act of this period was Edward's celebrated expulsion of the Jews from England (1290). This was the continuation of a policy which he had already carried out in Guienne. It would seem that his reasons were partly religious, but partly economic. No earlier king could have afforded to drive forth a race who had been so useful to the crown as bankers and money-lenders; but by the end of the 13th century the financial monopoly of the Jews had been broken by the great Italian banking firms, whom Edward had been employing already during his Welsh wars. Finding them no less accommodating than their rivals, he gratified the prejudices of his subjects and himself by forcing the Hebrews to quit England. The Italians in a few years became as unpopular as their predecessors in the trade of usury, their practices being the same, if their creed was not.

Edward I. and Scotland.—The latter part of Edward's reign was coloured throughout by the question of the Scotch succession, raised in 1286 by the death of Alexander III., the last king of the northern dynasty. Edward's attempt to enforce English overlordship over Scotland, the wars which followed, and the establishment of Robert Bruce as king of Scots form the turning point in Scotch history, and are discussed in articles relating to that subject (*see* SCOTLAND, WALLACE, BRUCE). But these events had a permanent effect on English history also. They created a new antagonism between England and Scotland, and gave a valuable ally in the north to the king of France. They seriously weakened Edward I. in his dealings with his barons. The dangerous Scotch rising under William Wallace, coming at a time when Edward was deeply involved in continental politics, compelled him to seek baronial support for the renewal of the war. Events in Scotland thus explain Edward's re-issue of Magna Carta and the Charter of the Forest in 1297, and account for his agreement at the same time to a material limitation of the royal power of taxation. Above all, the Scotch wars of Edward I. strained the national finances to the breaking point. The task of raising and equipping armies for protracted wars in a remote land overthrew the uncertain equilibrium which had previously been maintained between revenue and expenditure. The debts thus incurred by Edward I. contributed more than is usually realized to produce the crisis which arose in the next reign.

Despite the chequered fortunes of his later years the reign of Edward had been a time of progress for England. He had given his realm good and strong governance; according to his lights he had striven to keep faith and to observe his coronation oath. He had on more than one occasion quarrelled with his subjects, but matters had never been pushed to an open rupture. The nation, however much it might murmur, would never have been willing to rebel against a sovereign whose only fault was that he occasionally pressed his prerogative too far. Edward's rule was seldom or never oppressive; the seizure of the merchants' wool in 1297 was the only one of his acts which caused really widespread indignation. The realm was on the whole contented and even flourishing. Population and commerce were increasing; the intellectual activity which had marked the reign of Henry III. was still alive; architecture, religious and military, was in its prime. He himself was a great builder, and many of the perfected castles of that concentric style, which later ages have called the "Edwardian type," were of his own planning. In ecclesiastical architecture his reign represents the early flower of the "Decorated" order, perhaps the most beautiful of all the developments of English art. The reign may be regarded as the culmination and crowning point of the ages. It certainly gave a promise of greatness and steady progress which the 14th century was far from justifying.

Edward II.—With the great king's death in July 1307 a sudden change for the worse was at once visible. The individual character of the reigning king was still the main factor in political history, and Edward II. was in every respect a contrast to his father. He was incorrigibly frivolous, idle and apathetic, although his father had given him much stern schooling. He has been well described as "the first king since the Conquest who was not a man of business." He hated all kingly duties; he detested war, but he detested even more the routine work of administration. He was most at his ease in low company, his favourite diversion was gambling, his best trait a love for farming and the mechanical

arts of the smith and the gardener.

Piers Gaveston.—Edward's first acts on coming to the throne caused patriotic Englishmen to despair. His father, on his deathbed, had made him swear to conduct the Scottish expedition to its end. But he marched no further than Dumfries, and then turned back, on the pretext that he must conduct his parent's funeral in person. Leaving Bruce to gather fresh strength and to commence the tedious process of reducing the numerous English garrisons in Scotland, he betook himself to London, and was not seen on the border again for more than three years. He then dismissed all his father's old ministers, and replaced them by incompetent creatures of his own. But his most offensive act was to promote to the position of chief councillor of the crown, and disperser of the royal favours, a clever but vain and ostentatious Gascon knight, one Piers Gaveston, who had been the companion of his boyhood, and had been banished by Edward I. for encouraging him in his follies and frivolity. Piers was given the royal title of earl of Cornwall, and married to the king's niece; when Edward went over to France to do homage for Gascony, he even made his friend regent during his absence, in preference to any of his kinsmen.

The "Lords Ordainers."—The antagonism between Edward and the baronial opposition which had arisen at the beginning of the reign reached a climax in 1311 when the king's adversaries succeeded in placing him under the tutelage of twenty-one "lords ordainers," a baronial committee like that which had been appointed by the Provisions of Oxford, fifty years back. Edward was not to levy an army, appoint an official, raise a tax, or quit the realm without their leave. He had also to swear an obedience to a long string of constitutional limitations of his power, to promise to remove many practical grievances of administration and to agree to drastic changes in the personnel of his household. But there were two great faults in the proceedings of Thomas of Lancaster and his friends, The first was that they ignored the rights of the commons—save indeed that they got their ordinances confirmed by parliament—and put all power into the hands of a council which represented nothing but the baronial interest. The second, and more fatal, was that this council of "ordainers," when installed in office, showed energy in nothing save in persecuting the friends of Edward and Gaveston; it neglected the general welfare of the realm, and in particular made no effort whatever to end the Scottish war. It was clearly their duty either to make peace with Robert Bruce, or to exert themselves to crush him; but they would do neither.

Gaveston's unhappy career came to an end in 1312. After he had been twice exiled, and had been twice recalled by the king, he was besieged in Scarborough and captured by the earl of Pembroke. He was being conducted to London to be tried in parliament, when his two greatest enemies, Thomas of Lancaster and Guy, earl of Warwick, took him out of the hands of his escort, and beheaded him by the wayside without any legal authority or justification. The unhappy king was compelled to promise to forget and forgive this offence, and was then restored to a certain amount of freedom and power; the barons believed that when freed from the influence of Gaveston he would prove a less unsatisfactory sovereign. The experiment did not turn out happily. Bruce having at last made an almost complete end of the English garrisons within his realm, laid siege to Stirling, the last and strongest of them all, in the spring of 1313. Compelled by public opinion to attempt its relief, Edward crossed the border in June 1314 and the battle of Bannockburn, which secured the independence of Scotland, placed Edward at the mercy of the baronial opposition in England.

Thomas, Earl of Lancaster.—Thomas of Lancaster, who had refused to join in the late campaign, took advantage of its results to place the king once more in complete tutelage. His household was dismissed, and all his ministers and officials were changed. For more than three years Lancaster practically reigned in his cousin's name; it was soon found that the realm got no profit thereby, for Earl Thomas, though neither so apathetic nor so frivolous as Edward, was not a whit more competent to conduct either war or domestic administration. The Scots swept everything before them, ravaging the north at their will, and capturing Berwick. They even made a great expedition to Ireland, where Bruce's brother Edward was proclaimed king by the rebellious Celtic septs (*see* IRELAND, *History*). Meanwhile public order in England itself was falling into abeyance. The most extraordinary symptom of the time was a civic revolt at Bristol (1316), where the townsfolk expelled the royal judges, and actually stood a siege before they would submit. Such revolts of great towns were normal in Germany or Italy, but almost unknown on this side of the Channel. All this unrest might well be ascribed to Lancaster's want of ability, but he had also to bear—with less justice—the discontent caused by two years of famine and pestilence. In August 1318 he was removed from power by a league formed by Pembroke, Warenne, Arundel and others of the lords ordainers, who put a new council in power, and showed themselves somewhat less hostile to the king than Earl Thomas had been. Edward was allowed to raise an army for the siege of Berwick, and was lying before its walls, when the Scots, turning his flank, made a fierce foray into Yorkshire, and routed the shire-levy under Archbishop Melton at the battle of Myton. This so disheartened the king and the council that controlled him that they concluded a two years truce with Robert of Scotland, thus for the first time acknowledging him as a regular enemy and no mere rebel (1319).

The Despensers.—The time of comparative quiet that followed was utilized by the king in an attempt to win back some of his lost authority. For a short space Edward showed more capacity and energy than he had ever been supposed to possess. Probably this was due entirely to the fact that he had come under the influence of two able men who had won his confidence and had promised him revenge for the murdered Gaveston. These were the two Hugh Despensers, father and son; the elder was an ambitious baron who hated Lancaster, the younger had been made Edward's chamberlain in 1318 and had become his secret councillor and constant companion. Finding that the king was ready to back them in all their enterprises, the Despensers resolved to take the fearful risk of snatching at supreme power by using their master's name to oust the barons who were now directing affairs from their position. The task was the more easy because Lancaster was at open discord with the men who had supplanted him, so that the baronial party was divided; while the mishaps of the last six years had convinced the nation that other rulers could be as incompetent and as unlucky as the king. Indeed, there was a decided reaction in Edward's favour, since Lancaster and his friends had been tried and found wanting. Moreover, the Despensers felt that they had a great advantage over Gaveston in that they were native-born barons of ancient ancestry and good estate: the younger Hugh, indeed, through his marriage with the sister of the earl of Gloucester who fell at Bannockburn, was one of the greatest landowners on the Welsh border: they could not be styled upstarts or adventurers. Edward's growing confidence in the Despensers at last provoked the notice and jealousy of the dominant party. The barons brought up many armed retainers to the parliament of 1321, and forced the king to dismiss and to condemn them to exile. But their discomfiture was only to last a few months; in the following October a wanton outrage and assault on the person and retinue of Edward's queen, Isabella of France, by the retainers of Lord Badlesmere, one of Pembroke's associates, provoked universal reprobation. The king made it an excuse for gathering an army to besiege Badlesmere's castle at Leeds; he took it and hanged the garrison. He then declared the Despensers pardoned, and invited them to return to England. On this Thomas of Lancaster and the more resolute of his associates took arms, but the majority both of the baronage and of the commons remained quiescent, public opinion being rather with than against the king. The rebels displayed great indecision, and Lancaster proved such a bad general that he was finally driven into the north and beaten at the battle of Boroughbridge (March 16, 1322), where his chief associate, the earl of Hereford, was slain. Next day he surrendered, with the wreck of his host. But the king, who showed himself unexpectedly vindictive, beheaded him at once; three other peers, Badlesmere, Clifford and Mowbray, were sub-

sequently executed, with a score of knights.

Rebellion of Queen Isabella and Mortimer.—For the moment the king seemed triumphant; he called a parliament which revoked the "ordinances" of 1311, and replaced the Despensers in power. For the remaining four years of his reign they were omnipotent; but, able and unscrupulous as they were, they could not solve the problem of successful governance. To their misfortune the Scottish war once more recommenced, King Robert having refused to continue the truce. The fortune of Edward II. now hung on the chance that he might be able to maintain the struggle with success; he raised a large army and invaded Lothian, but Bruce refused a pitched battle, and drove him off with loss by devastating the countryside around him. Thereupon Edward, to the deep humiliation of the people, sued for another cessation of hostilities, and obtained it by conceding all that Robert asked, save the formal acknowledgment of his kingly title. But peace did not suffice to end Edward's troubles; he dropped back into his usual apathy, and the Despensers showed themselves so harsh and greedy that the general indignation only required a new leader in order to take once more the form of open insurrection. The end came in an unexpected fashion. Edward had quarrelled with his wife Isabella, who complained that he made her the "handmaid of the Despensers," and excluded her from her proper place and honour. Yet in 1325 he was unwise enough to send her over to France on an embassy to her brother Charles IV., and to allow his eldest son Edward, prince of Wales, to follow her to Paris. Having the boy in her power, and being surrounded by the exiles of Lancaster's faction, she set herself to plot against her husband, and opened up communications with the discontented in England. It was in vain that Edward besought her to return and to restore him his son; she came back at last, but at the head of an army commanded by Roger, Lord Mortimer, the most prominent survivor of the party of Earl Thomas, with whom she had formed an adulterous connection.

When she landed with her son in Suffolk in Sept. 1326, she was at once joined by Henry of Lancaster, the heir of Earl Thomas, and most of the baronage of the eastern counties. Edward and the Despensers, after trying in vain to raise an army, fled into the west. They were all caught by their pursuers; the two Despensers were executed—the one at Bristol, the other at Hereford. Several more of Edward's scanty band of friends—the earl of Arundel and the bishop of Exeter and others—were also slain. Their unhappy master was forced to abdicate on Jan. 20, 1327, his fourteen-year-old son being proclaimed king in his stead. Shortly afterwards he disappeared into close confinement, and though the circumstances of his end are obscure, there is little doubt that he was murdered before the end of the year by the orders of the queen and Mortimer.

The three years regency of Isabella, during the minority of Edward III., formed a disgraceful episode in the history of England. She was as much the tool of Mortimer as her husband had been the tool of the Despensers, and their relations became gradually evident to the whole nation. A new and formidable dignity was conferred on Mortimer when he was made both justiciar of the principality of Wales, and also earl of March, in which lay both his own broad lands and the estates of Despenser and Arundel, which he had recently annexed. The one politic act of Mortimer's administration, the conclusion of a permanent peace with Scotland by acknowledging Bruce as king (1328), was not one which made him more popular. But he easily overcame a conspiracy led by Edmund, Earl of Kent, the half brother of Edward II., and maintained himself in power until the young king felt strong enough to attempt a *coup de main.* On the night of Oct. 19, 1330, Mortimer was seized by a body of the king's friends while resident at Nottingham castle during a session of the great council, and was executed in the following month. The queen lived thenceforward in retirement and the effective reign of Edward III. began.

Edward III.—Edward showed none of his father's weakness and much of his grandfather's capacity. He fell short of Edward I. in steadiness of character and organizing power, but possessed all his military capacity and his love of work. Unfortunately for England his ambition was to be the mirror of chivalry rather than a model administrator. But his knightly virtues, his courage, his ready courtesy and his love of adventure made him popular with the nobility and the mass of his subjects were fully conscious of his military reputation. In most respects he was a perfect exponent of the ideals and foibles of his age, and it was not without reason that not England only but all western Europe looked up to him as the greatest king of his generation.

His first victories were won in Scotland. Robert Bruce was now dead and his throne was occupied by the young David II., whose factious nobles were occupied in civil strife when, in 1332, a pretender made a snatch at the Scottish throne. This was Edward, the son of John Baliol, an adventurous baron who collected all the "disinherited" Scots lords, the members of the old English faction who had been expelled by Bruce, and invaded the realm at their head. He beat the regent Mar at the battle of Dupplin, seized Perth and Edinburgh, and crowned himself at Scone. But knowing that his seat was precarious he did homage to the English king, and made him all the promises that his father had given to Edward I. The temptation was too great for the young king to refuse; he accepted the homage, and offered the aid of his arms. It was soon required, for Baliol was ere long expelled from Scotland. Edward won the battle of Halidon Hill (July 19, 1333)—where he displayed considerable tactical skill—captured Berwick, and reconquered a considerable portion of Scotland for his vassal. But he demanded too much from Baliol—forcing him to cede Lothian, Tweeddale and the larger part of Galloway, and to promise a tribute, and a Scotch reaction ended in his final expulsion. Nevertheless the fighting was all on Scottish ground, and Edward repeatedly made incursions into the very heart of the northern realm; on one occasion he reached Inverness unopposed. He held Perth till 1339, Edinburgh till 1341, and was actually in possession of much Scottish territory when his attention was called off from this minor war to the greater question of the struggle with France. Meanwhile he had acquired no small military reputation, had collected a large body of professional soldiers whose experience was to be invaluable to him in the continental war, and had practised in Scotland tactics evolved in the previous generation, which were to win Creçy and Poitiers. For the devices employed against the Scottish "schiltrons" of pikemen at Dupplin and Halidon, were the same as those which won all the great battles of the Hundred Years' War—the combination of archery, not with cavalry (the old system of Hastings and Falkirk), but with dismounted men-at-arms. The nation, meanwhile prosperous, not vexed by overmuch taxation, and proud of its young king, was ready to follow him into any adventure.

IV. THE HUNDRED YEARS' WAR (1337–1453)

The root of the Hundred Years' War must be sought in the affairs of Guienne. Already in the time of Edward I. the insecurity of the English position in south-western France was becoming manifest. Philip IV. of France had made serious encroachments upon English territory in that region, and for a moment had come near to its permanent acquisition. The Hundred Years' War was essentially due to the feeling that nothing but an attack upon the French monarchy could save the south-west of France for England. Other grounds of hostility between England and France were quite subsidiary to this, important as they were in themselves. The most obvious was the aid which Philip VI. had given to the exiled David Bruce, when he was driven out of Scotland by Edward and his ally Baliol. The English king replied by welcoming and harbouring Robert of Artois, a cousin whom Philip VI. had expelled from France. He also made alliances with several of the dukes and counts of the Netherlands, and with the emperor Louis the Bavarian, obviously with the intention of raising trouble for France on her northern and eastern frontiers.

It was Philip, however, who actually began the war, by declaring Guienne and the other continental dominions of Edward III. forfeited to the French crown, and sending out a fleet which ravaged the south coast of England in 1337. In return Edward raised a claim to the throne of France, because such a claim was in several ways a useful asset to him both in war and in diplomacy. It

was first turned to account when the Flemings, who had scruples about opposing their liege lord, the king of France, found it convenient to discover that, since Edward was the real king and not Philip, their allegiance was due in the same direction whither their commercial interests drew them. Led by the great demagogue dictator, Jacob van Artevelde, they became the mainstay of the English party in the Netherlands.

Edward's claim—such as it was—rested on the assertion that his mother, Isabella, was nearer of kin to her brother Charles IV., the last king of the main line of the house of Capet, than was Charles's cousin Philip of Valois. The French lawyers ruled that heiresses could not succeed to the crown themselves, but Edward pleaded that they could nevertheless transmit their right to their sons. He found it convenient to forget that the elder brother of Charles IV., King Louis X., had left a daughter, whose son, the king of Navarre, had on this theory a title preferable to his own. This prince, he said, had not been born at the time of his grandfather's death, and so lost any rights that might have passed to him had he been alive at that time. A far more fatal bar to Edward's claim than the existence of Charles of Navarre was the fact that the peers of France, when summoned to decide the succession question nine years before, had decided that Philip of Valois had the sole valid claim to the crown, and that Edward had then done homage to him for Guienne. If he pleaded that in 1328 he had been the mere tool of his mother and Mortimer, he could be reminded of the unfortunate fact that in 1331, after he had crushed Mortimer, and taken the power into his own hands, he had deliberately renewed his oath to King Philip.

Battle of Sluys.—In the commencement of his continental war Edward took little profit either from his assumption of the French royal title, or from the lengthy list of princes of the Low Countries whom he enrolled beneath his banner. His two expensive land-campaigns of 1339 and 1340 led to no victories or conquests. The Netherland allies brought large contingents and took high pay from the king, but they showed neither energy nor enthusiasm in his cause. When Philip of Valois refused battle in the open, and confined his operations to defending fortified towns, or stockading himself in entrenched camps, the allies drifted off, leaving the king with his English troops in force too small to accomplish anything. The sole achievement of the early years of the war which was of any profit to Edward or his realm was the great naval triumph of Sluys (June 24, 1340), which gave the English the command of the sea for the next twenty years. The French king had an enormous fleet, and with it threatened to invade England. Seeing that he could do nothing on land while his communications with the Low Countries were endangered by the existence of this armada, Edward levied every ship that was to be found, and brought the enemy to action in the Flemish harbour of Sluys. After a day of desperate hand to hand fighting the French fleet was annihilated. Henceforth England was safe from coast raids, could conduct her commerce with Flanders without danger, and could strike without difficulty at any point of the French littoral. As long as he persevered in the attempt to conduct the invasion of the northern frontier of France Edward achieved nothing.

Such schemes were finally abandoned because the king discovered that his allies were worthless and his money spent. On his return from Flanders in 1340 he became involved in an angry controversy with his ministers, whom he accused, quite unjustly, of wasting his revenue and wrecking his campaign thereby. He imprisoned some of them, and wished to try his late chancellor Archbishop Stratford, for embezzlement, in the court of the exchequer. But the primate contended very vigorously for the right to be tried before his peers, and since the king could get no subsidies from his parliament till he acknowledged the justice of this claim, he was forced to concede. Stratford was acquitted—the king's thriftlessness and not the chancellor's maladministration had emptied the treasury. Edward drifted on along the path to financial ruin till he actually went bankrupt in 1345, when he repudiated his debts, and ruined several great Italian banking houses, who had been unwise enough to continue lending him money to the last. The Flemings were also hard hit by this collapse of the king's credit, and very naturally lost their enthusiasm for the English alliance. Van Artevelde, its chief advocate, was murdered by his own townsmen in this same year.

War in Brittany. —The second act of the Hundred Years' War, after King Edward had abandoned in despair his idea of invading France from the side of the Netherlands, was fought out in another quarter—the duchy of Brittany. Here a war of succession had broken out in which (oddly enough) Edward took up the cause of the pretender who had male descent, while Philip supported the one who represented a female line—each thus backing the theory of heritage by which his rival claimed the throne of France. By espousing the cause of John of Montfort Edward obtained a good foothold on the flank of France, for many of the Breton fortresses were put into his hands. But he failed to win any decisive advantage thereby over King Philip. It was not till 1346, when he adopted the new policy of trusting nothing to allies, and striking at the heart of France with a purely English army, that Edward found the fortune of war turning in his favour.

Creçy and Calais.—In this year he landed in Normandy, where the English banner had not been seen since the days of King John, and executed a destructive raid through the duchy, and up the Seine, till he almost reached the gates of Paris. This brought out the king of France against him, with a mighty host, before which Edward retreated northward, apparently intending to retire to Flanders. But after crossing the Somme he halted at Creçy, near Abbeville, and offered battle to the pursuing enemy. Relying on the tactics which had been tried against the Scots at Dupplin and Halidon Hill, he drew up his army with masses of dismounted men-at-arms flanked on either side by archery. This array proved as effective against the disorderly charges of the French noblesse as it had been against the heavy columns of the Scottish pikemen. Fourteen times the squadrons of King Philip came back to the charge; but mowed down by the arrow-shower, they seldom could get to handstrokes with the English knights, and at last rode off the field in disorder. This astonishing victory over fourfold numbers was no mere chivalrous feat of arms; it had the solid result of giving the victors a foothold in northern France. For Edward took his army to beleaguer Calais, and after blockading it for nearly a year forced it to surrender. King Philip, after his experience at Creçy, refused to fight again in order to raise the siege. From henceforth the English possessed a secure landing-place in northern France, at the most convenient point possible, immediately opposite Dover. They held it for over two hundred years, to their own inestimable advantage in every recurring war.

The years 1345–1347 saw the zenith of King Edward's prosperity; in them fell not only his own triumphs at Creçy and Calais, but a victory at Auberoche in Périgord won by his cousin Henry of Lancaster, which restored many long-lost regions of Guienne to the English suzerainty (Oct. 21, 1345), and another and more famous battle in the far north. At Neville's Cross, near Durham, the lords of the Border defeated and captured David Bruce, king of Scotland (Oct. 17, 1346). The loss of their king and the destruction of a fine army took the heart out of the resistance of the Scots, who for many years to come could give their French allies little assistance.

Truce with France. The Black Death.—The renewal of the struggle in France was delayed by the appearance in England of the pestilence now generally known as the "Black Death." Its economic significance has been much exaggerated. It was sporadic in its incidence and heavy as was the mortality which it caused, it did not produce any dislocation of the national life. Its importance lies in the fact that it produced the most famous of mediaeval attempts to regulate wages and prices by law. The Statute of Labourers of 1351 tried, with more success than was once realized to restore the economic conditions which had prevailed before the pestilence by establishing the rates of wages current in 1347. Despite much evasion, the statute succeeded in its main object and forms an important landmark in the history of English local government.

Renewal of the War with France.—Before the renewal of the war with France, Philip VI. died (1350), and was succeeded by his son John. The war did not entirely cease, but became local and spasmodic. In Brittany the factions which supported the two

claimants to the ducal title were so embittered that they never laid down their arms. In 1351 the French noblesse of Picardy, apparently without their master's knowledge or consent, made an attempt to surprise Calais, which was beaten off with some difficulty by King Edward in person. There was also constant bickering on the borders of Guienne. But the main forces on both sides were not brought into action till the series of truces ran out in 1355. From that time onward the English took the offensive with great vigour. Edward, prince of Wales, ravaged Languedoc as far as the Mediterranean, while his younger brother John of Gaunt, duke of Lancaster, executed a less ambitious raid in Picardy and Artois. In the south this campaign marked real progress, not mere objectless plunder, for it was followed by the reconquest of great districts in Périgord and the Agenais, which had been lost to England since the 13th century. A similar double invasion of France led to even greater results in the following year, 1356. While Lancaster landed in Normandy, and with the aid of local rebels occupied the greater part of the peninsula of the Côtentin, the prince of Wales accomplished greater things on the borders of Aquitaine. After executing a great circular sweep through Périgord, Limousin and Berry, he was returning to Bordeaux laden with plunder, when he was intercepted by the king of France near Poitiers.

Battle of Poitiers and Peace of Brétigny.—The battle that followed was the most astonishing of all the English victories during the Hundred Years' War. The odds against the prince were far heavier than those of Creçy, but by taking up a strong position and using the national tactics which combined the use of archery and dismounted men-at-arms, the younger Edward not merely beat off his assailants in a long defensive fight, but finally charged out upon them, scattered them, and took King John prisoner (Sept. 19, 1356).

This fortunate capture put an enormous advantage in the hands of the English; for John, a facile and selfish prince, was ready to buy his freedom by almost any concessions. He signed two successive treaties which gave such advantageous terms to Edward III. that the dauphin Charles, who was acting as regent, and the French states-general refused to confirm them. This drove the English king to put still further pressure on the enemy; in 1359 he led out from Calais the largest English army that had been seen during the war, devastated all northern France as far as Reims and the borders of Burgundy, and then—continuing the campaign through the heart of the winter—presented himself before the gates of Paris and ravaged the Île de France. This brought the regent Charles and his counsellors to the verge of despair; they yielded, and on May 8, 1360, signed an agreement at Brétigny near Chartres, by which nearly all Edward's demands were granted. These preliminaries were ratified by the definitive peace of Calais (Oct. 24, 1360), which brought the first stage of the Hundred Years' War to an end.

By this treaty Edward formally gave up his claim to the French throne, which he had always intended to use merely as an asset for barter, and was to receive in return not only a sum of 3,000,000 gold crowns for King John's personal ransom, but an immense cession of territory which—in southern France at least—almost restored the old boundaries of the time of Henry II. The duchy of Aquitaine was reconstructed, so as to include not only the lands that Edward had inherited, and his recent conquests, but all Poitou, Limousin, Angoumois, Quercy, Rouergue and Saintonge—a full half of France south of the Loire. This vast duchy the English king bestowed not long after on his son Edward, the victor of Poitiers. Northern France, Calais and the county of Guînes, and also the isolated county of Ponthieu were ceded to Edward. All these regions were exempted for the future from all feudal dependence upon the French crown.

Submission of David of Scotland.—To complete the picture of the triumph of Edward III. at this culminating point of his reign, it must be mentioned that some time before the peace of Calais he had made terms with Scotland. David Bruce was to cede Roxburgh and Berwick, but to keep the rest of his dominions on condition of paying a ransom of 100,000 marks. This sum could never be raised, and Edward could always bring pressure to bear on the king of Scots by demanding the instalments. David gave no further trouble; indeed he became so friendly to England that he offered to proclaim Lionel of Clarence, Edward's second son, as his heir, and would have done so but for the vigorous opposition of his parliament.

English Rule in France.—For a few years after the peace of 1360 the political influence of Edward III. in western Europe seemed to be supreme. France, prostrated by the results of the English raids, by peasant revolts, and municipal and baronial turbulence, did not begin to recover strength till the thriftless king John had been succeeded by his capable if unchivalrous son Charles V. (1364). Yet the state of the English dominions on the continent was not satisfactory. Instead of creating a homogeneous Gascon State, which might have grown together into a solid unit, Edward had annexed broad regions which had been for a century and a half united to France. The disaffection of the south-western noblesse led to a renewal of the war before the peace had lasted for a decade. In 1367 the prince of Wales, to maintain English influence in Castile, led an army into that kingdom in support of its exiled ruler Peter "the Cruel," and in the battle of Najera defeated the rival claimant Henry of Trastamara, whose sympathies were with the French court. The expedition seemed necessary for the security of Aquitaine, but it led to the imposition of heavy taxation on this region and in 1368 the counts of Armagnac, Périgord and Comminges, appealed to the king of France as their suzerain against the legality of Edward's imposts. The French overlordship had been formally abolished by the treaty of Calais and when Charles V. cited Edward to appear before his *parlement* to answer the complaints of the counts, he was challenging England to renewed war.

Further Renewal of the War.—War, therefore, broke out again in 1369. Edward III. assumed once more the title of king of France, while Charles V. declared that the whole duchy of Aquitaine had been forfeited for treason and rebellion on the part of its present holder. The second period of war, which was to last till the death of the English king, and for some years after, was destined to prove wholly disastrous to England. All the conditions had changed since 1360. Edward, though only in his fifty-seventh year, was entering into a premature old age. The guidance of the war should have fallen into the hands of his eldest son, the victor of Poitiers and Najera, but the younger Edward had never recovered from the fatigues of his Spanish campaign; his disease having developed into a form of dropsy, he had became a confirmed invalid and could no longer take the field. The charge of the military operations of the English armies had passed to John of Gaunt, duke of Lancaster, the king's younger son, whose strategy, in the early years of the renewed war, consisted mainly of attempts to wear down the force of France by devastating raids; he hoped to provoke the enemy to battle by striking at the heart of his realm, but never achieved his purpose. Warned by the disasters of Creçy and Poitiers, Charles V. and his great captain Bertrand du Guesclin would never commit themselves to an engagement in the open field. They let the English invaders pass by, garrisoning the towns but abandoning the countryside. But while the duke was executing useless marches across France, the outlying lands of Aquitaine were falling away, one after the other, to the enemy. The limit of the territory which still remained loyal was ever shrinking, and what was once lost was hardly ever regained. Almost the only reconquest made was that of the city of Limoges, which was stormed in Sept. 1370 by the troops of the Black Prince, who rose from his sick-bed to strike his last blow at the rebels. His success did almost as much harm as good to his cause, for the deliberate sack of the city was carried out with such ruthless severity that it roused wild wrath rather than terror in the neighbouring regions. Next spring the prince returned to England, feeling himself physically unable to administer or defend his duchy any longer.

The greater part of Poitou, Quercy and Rouergue had been lost, and the English cause was everywhere losing ground, when a new danger was developed. Henry of Trastamara, the French ally, had now established himself as king of Castile, and in 1372

a Spanish fleet joined the French, and destroyed off La Rochelle a squadron which was bringing reinforcements for Guienne. From this date onward Franco-Spanish fleets were perpetually to be met not only in the Bay of Biscay but in the Channel; they made the voyage to Bordeaux unsafe, and often executed descents on the shores of Kent, Sussex, Devon and Cornwall. It was to no effect that, in the year after the battle of La Rochelle, Lancaster carried out the last, the most expensive, and the most fruitless of his great raids across France. He marched from Calais to Bordeaux, inflicted great misery on Picardy, Champagne and Berry, and left half his army dead by the way.

This did not prevent Bertrand du Guesclin from expelling from his dominions John of Brittany, the one ally whom King Edward possessed in France, or from pursuing a consistent career of petty conquest in the heart of Aquitaine. By 1374 little was left of the great possessions which the English had held beyond the Channel save Calais, and the coast slip from Bordeaux to Bayonne, which formed the only loyal part of the duchy of Guienne. Next year Edward sued for peace—he failed to obtain it, finding the French terms too hard for acceptance—but a truce at least was signed at Bruges (Jan. 1375) which endured till a few weeks before his death.

In the last two years of the reign interest is once more centred on political issues. The ill success of the French war led to an attack on the king's ministers, and in 1376 the opposition found constitutional expression. In the "Good Parliament" of this year the leading ministers were impeached, a council of twelve peers was created to assist and control the king, and an elaborate programme of reform was set out in a series of petitions. The king himself was too infirm to deal with the situation, but the duke of Lancaster handled it competently on his behalf, and prevented any permanent encroachment on the royal power. The political struggle was complicated by the anti-clerical movement of the time (*see* LOLLARDS); and the duke for a short period allied himself with the critics of the ecclesiastical order and their leader John Wycliffe (*q.v.*) against the churchmen who formed the centre of opposition to the court party. In the middle of the crisis the old king died (June 21, 1377), his successor Richard son of Edward prince of Wales was a child of nine, and a rough balance between the various parties at court was maintained in the council which was appointed to govern England in his name.

Richard II.—The first parliament of Richard met in October under the most gloomy auspices. It showed its temper by taking up the work of the "Good Parliament." Lancaster's adherents were turned out of the council; the persons condemned in 1376 were declared incapable of serving in it, and the little king was made to repudiate the declaration whereby his uncle had quashed the statutes of 1376 by declaring that "no act of parliament can be repealed save with parliament's consent." John of Gaunt bowed before the storm, retired to his estates, and for some time took little part in affairs of State.

Unfortunately the new government proved wholly unable either to conduct the struggle with France successfully or to pluck up courage to make a humiliating peace—the only wise course before them. The nation was too proud to accept defeat, and persevered in the unhappy attempt to reverse the fortunes of war. An almost unbroken series of petty disasters marked the first three years of King Richard. The worst was the failure of the last great devastating raid which the English launched against France. Thomas of Woodstock, the youngest son of Edward III., took a powerful army to Calais, and marched through Picardy and Champagne, past Orleans, and finally to Rennes in Brittany, but accomplished nothing save the ruin of his own troops and the wasting of a vast sum of money. Meanwhile taxation was heavy, the whole nation was seething with discontent, and—what was worse—no way out of the miserable situation was visible; ministers and councillors were repeatedly displaced, but their successors always proved equally incompetent to find a remedy.

The Great Revolt of 1381.—This period of murmuring and misery culminated in the Great Revolt of 1381, a phenomenon whose origins must be sought in the most complicated causes, but whose outbreak was due in the main to a general feeling that the realm was being misgoverned. It was actually provoked by the unwise and unjust poll-tax of one shilling a head on all adult persons, voted by the parliament of Northampton in Nov. 1380. The last poll-tax had been carefully graduated on a sliding scale so as to press lightly on the poorest classes; in this one a shilling for each person had to be exacted from every township, though it was provided that "the strong should help the weak" to a certain extent. But in hundreds of villages there were no "strong" residents, and the poorest cottager had to pay his three groats. The peasantry defended themselves by the simple device of understating the numbers of their families; the returns made it appear that the adult population of England had gone down from 1,355,000 to 896,000 since the poll-tax of 1379. Thereupon the government sent out commissioners to revise the returns and exact the missing shillings. Their appearance led to a series of widespread and preconcerted riots, which soon spread over all England from the Wash to the Channel, and in a few days developed into a formidable rebellion. The poll-tax was no more than the spark which fired the mine; it merely provided a good general grievance on which all malcontents could unite. In the districts which took arms two main causes of insurrection may be differentiated; the first and the most widespread was the discontent of the rural population with the landowners and the Statute of Labourers. Their aim was to abolish all villein-service, and to wring from their lords the commutation of all manorial customs and obligations for a small rent—fourpence an acre was generally the sum suggested. But there was a simultaneous outbreak in many urban districts. In Winchester, London, St. Albans, Canterbury, Bury, Beverley, Scarborough and many other places the rioting was as violent as in the countryside. Here the object of the insurgents was in most cases to break down the local oligarchy, who engrossed all municipal office and oppressed the meaner citizens; but in less numerous instances their end was to win charters from lords (almost always ecclesiastical lords) who had hitherto refused to grant them. But it must not be forgotten that there was also a tinge of purely political discontent about the rising; the insurgents everywhere proclaimed their intention to destroy "traitors," of whom the most generally condemned were the chancellor, Archbishop Sudbury, and the treasurer, Sir Robert Hailes, the two persons most responsible for the levy of the poll-tax. Often the rebels added the name of John of Gaunt to the list, looking upon him as the person ultimately responsible for the mismanagement of the war and the misgovernment of the realm. It must be added that though the leaders of the revolt were for the most part local demagogues, the creatures of the moment, there were among them a few fanatics like the "mad priest of Kent," John Ball, who had long preached socialist doctrines from the old text:

> When Adam delved and Eve span
> Who was then the gentleman?

and clamoured for the abolition of all differences of rank, status and property. Though many clerics were found among the rebels, it does not seem that any of them were Wycliffites, or that the reformer's teaching had played any part in exciting the peasantry at this time. No contemporary authority ascribes the rising to the Lollards.

The riots had begun, almost simultaneously in Kent and Essex: from thence they spread through East Anglia and the home counties. In the west and north there were only isolated and sporadic outbreaks, confined to a few turbulent towns. In the countryside the insurrection was accompanied by wholesale burnings of manor-rolls, the hunting down of unpopular bailiffs and landlords, and a special crusade against the commissioners of the poll-tax and the justices who had been enforcing the Statute of Labourers. There was more arson and blackmailing than murder, though some prominent persons perished, such as the judge, Sir John Cavendish, and the prior of Bury. In many regions the rising was purely disorderly and destitute of organization. This was not, however, the case in Kent and London. The mob which had gathered at Maidstone and Canterbury marched on the capital many thousands strong, headed by a local demagogue named Wat Tyler, whom they had chosen as their captain; his

most prominent lieutenant was the preacher John Ball. They announced their intention of executing all "traitors," seizing the person of the king, and setting up a new government for the realm. The royal council and ministers showed grievous incapacity and cowardice—they made no attempt to raise an army, and opened negotiations with the rebels. While these were in progress the malcontent party in London, headed by three aldermen, opened the gates of the city to Tyler and his horde. They poured in, and, joined by the London mob, sacked John of Gaunt's palace of the Savoy, the Temple, and many other buildings, while the ministers took refuge with the young king in the Tower. It was well known that not only the capital and the neighbouring counties but all eastern England was ablaze, and the council in despair sent out the young king to parley with Tyler at Mile End. The rebels at first demanded no more than that Richard should declare villeinage abolished, and that all feudal dues and services should be commuted for a rent of fourpence an acre. This was readily conceded, and charters were drawn up to that effect and sealed by the king. But, while the meeting was still going on, Tyler went off to the Tower with a part of his horde, entered the fortress unopposed, and murdered the unhappy chancellor, Archbishop Sudbury, the treasurer, and several victims more. This was only the beginning of massacre. Instead of dispersing with their charters, as did many of the peasants, Tyler and his confederates ran riot through London, burning houses and slaying lawyers, officials, foreign merchants and other unpopular persons. This had the effect of frightening the propertied classes in the city, who had hitherto observed a timid neutrality, and turned public opinion against the insurgents. Next day the rebel leaders again invited the king to a conference, in the open space of Smithfield, and laid before him a programme very different from that propounded at Mile End. Tyler demanded that all differences of rank and status should cease, that all church lands should be confiscated and divided up among the laity, that the game laws should be abolished, and that "no lord should any longer hold lordship except civilly." Apparently he was set on provoking a refusal, and thus getting an excuse for seizing the person of the king. But matters went otherwise than he had expected; when he waxed unmannerly, and unsheathed his dagger to strike one of the royal retinue who had dared to answer him back, the mayor of London, William Walworth, drew his cutlass and cut him down. The mob strung their bows, and were about to shoot down the king and his suite. But Richard—who showed astounding nerve and presence of mind for a lad of fourteen—cantered up to them and shouting that he would be their chief and captain and would give them their rights. The conference was continued, but, while it was in progress, the mayor brought up the whole civic militia of London, who had taken arms when they saw that the triumph of the rebels meant anarchy, and rescued the king out of the hands of the mob. Seeing such a formidable body of armed men opposed to them, the insurgents dispersed—without their reckless and ready-witted captain they were helpless (June 15, 1381).

This was the turning-point of the rebellion; within a few days the council had collected a considerable army, which marched through Essex scattering such rebel bands as still held together. Kent was pacified at the same time; and Henry Despenser, the warlike bishop of Norwich, made a separate campaign against the East Anglian insurgents, defeating them at the skirmish of North Walsham, and hanging the local leader Geoffrey Lister, who had declared himself "king of the commons" (June 25, 1381). After this there was nothing remaining save to punish the leaders of the revolt; a good many scores of them were hanged, though the vengeance exacted does not seem to have been greater than was justified by the numerous murders and burnings of which they had been guilty; the fanatic Ball was, of course, among the first to suffer. On Aug. 30, the rough methods of martial law were suspended, and on Dec. 14, the king issued an amnesty to all save certain leaders who had hitherto escaped capture. A parliament had been called in November; it voted that all the charters given by the king at Mile End were null and void, no manumissions or grants of privileges could have been valid without the consent of the estates of the realm, "and for their own parts they would never consent to such, of their own free will nor otherwise, even to save themselves from sudden death."

The rebellion, therefore, had failed either to abolish villeinage in the countryside or to end municipal oligarchy in the towns. Nevertheless serfdom continued to decline all through the latter years of the 14th century, and was growing obsolete in the 15th. This, however, was the result of economic causes and of the establishment of the legal principle which gave the tenant in villeinage security of tenure so long as he performed the services due from his holdings. The course of English social history was little affected by the events of 1381. The manorial system was already doomed, and the rent-paying tenant farmers, who had begun to appear after the Black Death, gradually superseded the villeins as the normal type of peasantry during the two generations that followed the outbreak that is generally known as "Wat Tyler's rebellion."

Richard's Personal Rule.—King Richard, though he had shown such courage and ready resource at Smithfield, was still only a lad of fourteen. The subsequent course of events in his reign was to a great extent determined by his personal character. He was wayward, high-spirited and self-confident. He wished to restore the royal powers which had slipped into the hands of the council and parliament during his minority, and had small doubts of his capacity to restore it. His chosen instruments were two men whom his enemies called his "favourites," though it was absurd to apply the name either to an elderly statesman like Michael de la Pole, who was made chancellor in 1384, or to Robert de Vere, earl of Oxford, a young noble of the oldest lineage, who was the king's other confidant. Neither of them was an upstart, and both, the one from his experience and the other from his high station, were persons who might legitimately aspire to a place among the advisers of the king. But Richard was tactless; he openly flouted his two uncles, John of Gaunt and Thomas of Woodstock, and took no pains to conciliate either the baronage or the commons. His autocratic airs and his ostentatious preference for his confidants—of whom he made the one earl of Suffolk and the other marquess of Dublin—provoked both lords and commons. Pole was impeached on a groundless charge of corruption and condemned, but Richard at once pardoned him and restored him to favour. De Vere was banished to Ireland, but at his master's desire omitted to leave the realm. The contemptuous disregard for the will of parliament which the king displayed brought on him a worse fate than he deserved. His youngest uncle, Thomas of Woodstock, duke of Gloucester, was a designing and ambitious prince who saw his own advantage in embittering the strife between Richard and his parliament. John of Gaunt having departed to Spain, where he was stirring up civil strife in the name of his wife, the heiress of Peter the Cruel, Gloucester put himself at the head of the opposition. Playing the part of the demagogue, and exaggerating all his nephew's petulant acts and sayings, he declared the constitution in danger, and took arms at the head of a party of peers, the earls of Warwick, Arundel and Nottingham, and Henry, earl of Derby, the son of John of Gaunt, who called themselves the lords appellant, because they were ready to "appeal" Richard's councillors of treason. Public opinion was against the king, and the small army which his confidant De Vere raised under the royal banner was easily scattered by Gloucester's forces at the rout of Radcot Bridge (Dec. 20, 1387). Oxford and Suffolk succeeded in escaping to France, but the king and the rest of his adherents fell into the hands of the lords appellant. They threatened for a moment to depose him, but finally placed him under the control of a council and ministers chosen by themselves, and to put him in a proper state of terror, executed Lord Beauchamp, Sir Robert Tressilian the chief justice, and six or seven more of his chief friends. This was a piece of gratuitous cruelty, for the king, though wayward and unwise, had done nothing to justify such treatment.

To the surprise of the nation Richard took his humiliation quietly. But he was merely biding his time; he had sworn revenge in his heart, but he was ready to wait long for it. For the next nine years he appeared an unexceptionable sovereign, anxious only to conciliate the nation and parliament. He got rid of the

ministers imposed upon him by the lords appellant, but replaced them by Bishop Wykeham and other old statesmen against whom no objection could be raised. He disarmed Gloucester by making a close alliance with his elder uncle John of Gaunt, who had been absent in Spain during the troubles of 1387–88, and was displeased at the violent doings of his brother. His rule was mild and moderate, and he succeeded at last in freeing himself from the incubus of the French war—the source of most of the evils of the time, for it was the heavy taxation required to feed this struggle which embittered all the domestic politics of the realm. After two long truces, which filled the years 1390–95, a definitive peace was at last concluded, by which the English king kept Calais and the coast strip of Guienne, from Bordeaux to Bayonne, which had never been lost to the enemy. To confirm the peace, he married Isabella, the young daughter of Charles VI. (Nov. 1396); he had lost his first wife, the excellent Anne of Bohemia, two years before.

Richard and Ireland.—The king seemed firmly seated on his throne—so much so that in 1395 he had found leisure for a long expedition to Ireland, which none of his ancestors had visited since King John. He compelled all the native princes to do him homage, and exercised the royal authority in such a firm manner as had never before been known in the island. But those who looked forward to quiet and prosperous times both for Ireland and for England were destined to be undeceived. In 1397 Richard carried out an extraordinary and unexpected *coup d'état,* which he had evidently premeditated for years. Having lived down his unpopularity, and made himself many powerful friends, he arrested the duke of Gloucester and sent him over to Calais, where he was secretly murdered. At the same time Gloucester's two chief confederates of 1387, the earls of Arundel and Warwick, were sentenced to death: the former was actually executed, the latter imprisoned for life. The other two lords appellant, Mowbray, duke of Norfolk, and Henry of Bolingbroke, the son of John of Gaunt, were dealt with a year later, when Richard used a private quarrel between them as a justification for their banishment.

Arbitrary Rule of Richard.—Having thus completed his vengeance on those who had slain his friends ten years before, Richard felt himself secure. He might have been so, if he had continued to rule as cautiously as during the time when he was nursing his scheme of revenge. But in the last phase of his reign he alarmed the conservative elements in the kingdom by language which implied that he regarded himself as an absolute king, and by the violence of his action. He declared that all pardons issued since 1387 were invalid, and imposed heavy fines on persons, and even on whole shires, that had given the lords appellant aid. He made huge forced loans, and employed recklessly the abuse of purveyance. He browbeat the judges on the bench, and kept many persons under arrest for indefinite periods without a trial. In 1398 he compelled a parliament at Shrewsbury to entrust its powers to a small committee of ten persons, all creatures of his own. This body he used as his instrument of government, treating its assent as equivalent to that of a whole parliament in session. There seemed to be an end to the constitutional liberties of England.

Henry of Bolingbroke Returns to England.—Such violence, however, speedily brought its own punishment. In 1399 Richard sailed over to Ireland to put down a revolt of the native princes, who had defeated and slain the earl of March, his cousin and their lord-lieutenant. While he was absent Henry of Bolingbroke landed at Ravenspur with a small body of exiles and mercenaries. He pretended that he had merely come to claim the estates and title of his father John of Gaunt, who had died a few months before. The adventurer was at once joined by the earl of Northumberland and all the lords of the north; the army which was called out against him refused to fight, and joined his banner, and in a few days he was master of all England (July 1399). King Richard, hurrying back from Ireland, landed at Milford Haven just in time to learn that the levies raised in his name had dispersed or joined the enemy. He deserted his army by night, and fled into the Welsh mountains, apparently with the intention of collecting fresh adherents from North Wales and Cheshire, the only regions where he was popular. But Bolingbroke had already seized Chester, and was marching against him at the head of such a large army that the countryside refused to stir. At last Richard surrendered to his cousin at Flint, on Aug. 19, 1399, having previously stipulated that if he consented to abdicate his life should be spared, his adherents pardoned, and an honourable livelihood assured to him.

Accession of Henry IV.—Richard duly abdicated, and the throne was declared vacant. There was small doubt as to the personality of his successor; possession is nine points of the law, and Henry of Bolingbroke for the moment had the whole nation at his back. His hereditary title indeed was imperfect; though he was the eldest descendant of Edward III. in the male line after Richard, yet there was a whole family which stood between him and the crown. From Lionel of Clarence, the second son of Edward III. (John of Gaunt was only the third) descended the house of March, and the late king had proclaimed that Edmund of March would be his heir if he should die childless. Fortunately for Bolingbroke the young earl was only six years of age; not a voice was raised in his favour in parliament. When Henry stood forward and claimed the vacant throne by right of conquest and also by right of descent, no one gainsaid him. Lords and commons voted that they would have him for their king, and he was duly crowned on Oct. 13, 1399. No faith was kept with the unhappy Richard; he was placed in secret confinement, and denied the ordinary comforts of life. Moreover the adherents for whose safety he had stipulated were at once impeached of treason.

Henry of Lancaster came to the throne, for all intents and purposes as an elective king; he had to depend for the future on his ability to conciliate and satisfy the baronage and the commons by his governance. For by his usurpation he had sanctioned the theory that kings can be deposed for incapacity and maladministration. If he himself should become unpopular, all the arguments that he had employed against Richard might be turned against himself. The prospect was not reassuring; his revenue was small, and parliament would certainly murmur if he tried to increase it. The late king was not without partisans and admirers. There was a considerable chance that the French king might declare war—nominally to avenge his son-in-law, really to win Calais and Bordeaux. Of the partisans who had placed Henry on the throne many were greedy, and some were wholly unreasonable. But he trusted to his tact and his energy, and cheerfully undertook the task of ruling as a constitutional king—the friend of the parliament that had placed him on the throne.

Rebellion of the Earls.—The problem proved more weary and exhausting than he had suspected. From the very first his reign was a time of war, foreign and domestic, of murmuring, and of humiliating shifts and devices. Henry commenced his career by granting the adherents of Richard II. their lives, after they had been first declared guilty of treason and had been deprived of the titles, lands and endowments given them by the late king. Their reply to this very modified show of mercy was to engage in a desperate conspiracy against him. If they had waited till his popularity had waned, they might have had some chance of success, but in anger and resentment they struck too soon. The earls of Kent and Huntingdon, close kinsmen of Richard on his mother's side, the earl of Salisbury—a noted Lollard—and the lords Despenser and Lumley took arms at midwinter (Jan. 4, 1400) and attempted to seize the king at Windsor. They captured the castle, but Henry escaped, raised the levies of London against them, and beat them into the west. Kent and Salisbury were slain at Cirencester, the others captured and executed with many of their followers. Their rebellion sealed the fate of the master in whose cause they had risen. Henry and his counsellors were determined that there should be no further use made of the name of the "lawful king," and Richard was deliberately murdered by privation—insufficient clothing, food and warmth—in his dungeon at Pontefract Castle (Feb. 17, 1400). It is impossible not to pity his fate. He had been wayward, unwise and occasionally revengeful; but his provocation had been great, and if few tyrants have used more violent and offensive language, few have committed such a small list of actual crimes. It was a curious commentary on Hen-

ry's policy, that Richard, even when dead, did not cease to give him trouble. Rumour got abroad, owing to the secrecy of his end, that he was not really dead, and an impostor long lived at the Scottish court who claimed to be the missing king, and was recognized as Richard by many malcontents who wished to be deceived.

Welsh Rising Under Owen Glendower.—The rising of the earls was only the first and least dangerous of the trials of Henry IV. Only a few months after their death a rebellion of a far more formidable sort broke out in Wales—where Richard II. had been popular, and the house of March, his natural heirs, held large estates. The leader was a gentleman named Owen Glendower, who had the blood of the ancient kings of Gwynedd in his veins. Originally he had taken to the hills as a mere outlaw, in consequence of a quarrel with one of the marcher barons; but after many small successes he began to be recognized as a national leader by his countrymen, and proclaimed himself prince of Wales. The king marched against him in person in 1400 and 1401, but Glendower showed himself a master of guerrilla warfare; he refused battle, and defied pursuit in his mountains, till the stores of the English army were exhausted and Henry was forced to retire. His prestige as a general was shaken, and his treasury exhausted by these fruitless irregular campaigns.

War with Scotland.—External troubles continued to multiply during Henry's earlier years. The Scots had declared war, and there was every sign that the French would soon follow suit, for the king's failure to crush Glendower had destroyed his reputation for capacity. The rebel achieved his greatest success in June 1402, when he surprised and routed the whole levy of the marcher lords at Bryn G'las, between Pilleth and Knighton, capturing (among many other prisoners) Sir Edmund Mortimer, the uncle and guardian of the young earl of March, whom all malcontents regarded as the rightful monarch of England. A few months after the king's fortune seemed to take a turn for the better, when the Scots were defeated at Homildon Hill by the earl of Northumberland and his son Henry Percy, the celebrated "Hotspur." But this victory was to be the prelude to new dangers: half the nobility of Scotland had been captured in the battle, and Northumberland intended to fill his coffers with their ransoms; but the king looked upon them as state prisoners and announced his intention of taking them out of the earl's hands. Northumberland was a greedy and unscrupulous Border chief, who regarded himself as entitled to exact whatever he chose from his master, because he had been the first to join him at his landing in 1399, and had lent him a consistent support ever since. He had been amply rewarded by grants of land and money, but was not yet satisfied. In indignation at the first refusal that he had met, the earl conspired with Glendower to raise rebellion in the name of the rightful heirs of King Richard, the house of March. The third party in the plot was Sir Edmund Mortimer, Glendower's captive, who was easily persuaded to join a movement for the aggrandizement of his own family. He married Owen's daughter, and became his trusted lieutenant. Northumberland also enlisted the services of his chief Scottish prisoner, the earl of Douglas, who promised him aid from beyond Tweed.

Insurrection in the North and West.—In July 1403 came the crisis of Henry's reign; while Glendower burst into South Wales, and overran the whole countryside as far as Cardiff and Carmarthen, the Percies raised their banner in the North. The old earl set himself to subdue Yorkshire; his son Hotspur and the earl of Douglas marched south and opened communication with the Welsh. All Cheshire, a district always faithful to the name of Richard II., rose in their favour, and they were joined by Hotspur's uncle, the earl of Worcester. They then advanced towards Shrewsbury, where they hoped that Glendower might meet them. But long ere the Welsh could appear, King Henry was on the spot; he brought the rebels to action at Hately Field, just outside the gates of Shrewsbury, and inflicted on them a complete defeat, in which his young son Henry of Monmouth first won his reputation as a fighting man. Hotspur was slain, Worcester taken and beheaded, Douglas desperately wounded (July 23, 1403). On receiving this disastrous news the earl of Northumberland sued for pardon; the king was unwise enough to grant it, merely punishing him by fining him and taking all his castles out of his hands.

War with France Renewed.—By winning the battle of Shrewsbury Henry IV. had saved his crown, but his troubles were yet far from an end. The long-expected breach with France had at last come to pass; the duke of Orleans, without any declaration of war, had entered Guienne, while a French fleet attacked the south-west of England, and burnt Plymouth. Even more menacing to the king's prosperity was the news that another squadron had appeared off the coast of Wales, and landed stores and succours for Glendower, who had now conquered the whole principality save a few isolated fortresses. The drain of money to meet this combination of foreign war and domestic rebellion was more than the king's exchequer could meet. He was driven into unconstitutional ways of raising money, which recalled all the misdoings of his predecessor. Hence came a series of rancorous quarrels with his parliaments, which grew more disloyal and clamorous at every new session. The cry was raised that the taxes were heavy not because of the French or Welsh wars, but because Henry lavished his money on favourites and unworthy dependents. He was forced to bow before the storm, though the charge had small foundation: the greater part of his household was dismissed, and the war-taxes were paid not to his treasurer but to a financial committee appointed by parliament.

Rising of 1405 in the North.—It was not till 1405 that the worst of Henry's troubles came to an end. This year saw the last of the convulsions that threatened to overturn him,—a rising in the North headed by the old earl of Northumberland, by Richard Scrope, archbishop of York, and by Thomas Mowbray the earl marshal. It might have proved even more dangerous than the rebellion of 1403, if Henry's unscrupulous general Ralph, earl of Westmorland, had not lured Scrope and Mowbray to a conference, and then arrested them under circumstances of the vilest treachery. He handed them over to the king, who beheaded them both outside the gate of York, without any proper trial before their peers. Northumberland thereupon fled to Scotland without further fighting. He remained in exile till January 1408, when he made a final attempt to raise rebellion in the North, and was defeated and slain at the battle of Bramham Moor.

Suppression of the Welsh Rising.—Long before this last-named fight Henry's fortunes had begun to mend. Glendower was at last checked by the king's eldest son, Henry of Monmouth, who had been given charge of the Welsh war. Even when French aid was sent him, the rebel chief proved unable to maintain his grip on South Wales. He was beaten out of it in 1406, and Aberystwyth Castle, where his garrison made a desperate defence for two years, became the southern limit of his dominions. In the end of 1408 Prince Henry captured this place, and six weeks later Harlech, the greatest stronghold of the rebels, where Sir Edmund Mortimer, Owen's son-in-law and most trusted captain, held out till he died of starvation. From this time onwards the Welsh rebellion gradually died down, till Owen relapsed into the position from which he had started, that of a guerrilla chief maintaining a predatory warfare in the mountains. From 1409 onward he ceased to be a public danger to the realm, yet so great was his cunning and activity that he was never caught.

End of the French and Scottish Wars.—The French war died down about the same time that the Welsh rebellion became insignificant. Louis of Orleans, the head of the French war party, was murdered by his cousin John, duke of Burgundy, in November 1407, and after his death the French turned from the struggle with England to indulge in furious civil wars. Calais, Bordeaux and Bayonne still remained safe under the English banner. The Scottish war had ended even earlier. Prince James, the heir of Robert III., had been captured at sea in 1406. From 1408 till his death in 1413 Henry was freed from all the dangers which had beset his earlier years. But from 1409 onwards he became a mere invalid, only able to assert himself in rare intervals of convalescence and the domestic politics of his last five years have little interest or significance.

Accession of Henry V.—On March 20, 1413, his long illness at last reached a fatal issue, and his eldest son ascended the throne.

The new king had everything in his favour; his father had borne the odium of usurpation and fought down the forces of anarchy. The memory of Richard II. had been forgotten; the young earl of March had grown up into the most harmless and unenterprising of men, and the nation seemed satisfied with the new dynasty, whose first sovereign had shown himself, under much provocation, the most moderate and accommodating of constitutional monarchs.

Henry V. on his accession bade farewell to the faults of his youth. He seems to have felt a genuine regret for the unfilial conduct which had vexed his father's last years, and showed a careful determination to turn over a new leaf and give his enemies no scope for criticism. From the first he showed a sober and grave bearing; he reconciled himself to all his enemies, gave up his youthful follies, and became a model king according to the ideas of his day. There is no doubt that he had a strong sense of moral responsibility, and that he was sincerely pious. But his piety inspired him to redouble the persecution of the unfortunate Lollards (*q.v.*) and his sense of moral responsibility did not prevent him from taking the utmost advantage of the civil wars of his unhappy neighbours of France.

Battle of Agincourt.—After preliminary negotiations Henry sailed for France in August 1415, with an army compact but not very numerous. On the eve of his departure he detected and quelled a plot framed by his cousin, Richard, earl of Cambridge, Lord Scrope and Sir Thomas Grey, a kinsman of the Percies. They had planned to raise a rebellion in the name of the earl of March, in whose cause Wales and the North were to have been called to arms. But March himself refused to stir, and betrayed them to the king, who promptly beheaded them, and set sail five days later. He landed near the mouth of the Seine, and commenced his campaign by besieging and capturing Harfleur, which the Orleanists made no attempt to succour. But such a large number of his troops perished in the trenches by a pestilential disorder, that he found himself too weak to march on Paris, and took his way to Calais across Picardy, hoping, as it seems, to lure the French to battle by exposing his small army to attack. The plan was hazardous, for the Orleanists turned out in great numbers and almost cut him off in the marshes of the Somme. When he had struggled across them, and was half-way to Calais, the enemy beset him in the fields of Agincourt (Oct. 25, 1415). Here Henry vindicated his military reputation by winning a victory even more surprising than those of Creçy and Poitiers, for he was outnumbered in an even greater proportion than the two Edwards had been in 1346 and 1356, and had to take the offensive instead of being attacked in a strong position. The heavily armoured French noblesse, embogged in miry meadows, proved helpless before the lightly equipped English archery. The slaughter in their ranks was terrible, and the young duke of Orleans, the head of the predominant faction of the moment, was taken prisoner with many great nobles. However, so exhausted was the victorious army that Henry merely led it back to Calais, without attempting anything more in this year. The sole tangible asset of the campaign was the possession of Harfleur, the gate of Normandy, a second Calais in its advantages when future invasions were taken in hand. The moral effects were more important. The Orleanist party was shaken in its power; the rival Burgundian faction became more inclined to commit itself to the English cause, and the terror of the English arms weighed heavily upon both.

Conquest of Normandy.—In July 1417 Henry began his second invasion of France. He landed at the mouth of the Seine with a powerful army of 17,000 men, and aimed from the first at the steady and gradual conquest of Normandy. This he was able to accomplish without any interference from the government at Paris, for the constable Armagnac, who had succeeded the captive Orleans at the head of the anti-Burgundian party, had no troops to spare. He was engaged in a separate campaign with Henry's ally John the Fearless, and left Normandy to shift for itself. One after another all the towns of the duchy were reduced, save Rouen, the siege of which, as the hardest task, King Henry postponed till the rest of the countryside was in his hands. He sat down to besiege it in 1418, and was detained before its walls for many months, for the citizens made an admirable defence. Meanwhile a change had taken place in the domestic politics of France; the Burgundians seized Paris in May 1418; the constable Armagnac and many of his partisans were massacred, and John the Fearless got possession of the person of the mad Charles VI., and became the responsible ruler of France. He had then to choose between buying off his English allies by great concessions, or taking up the position of champion of French interests. He selected the latter rôle, broke with Henry, and tried to relieve Rouen. But all his efforts were foiled, and the Norman capital surrendered, completely starved out, on Jan. 19, 1419. On this Burgundy resolved to open negotiations with Henry; he wished to free his hands for an attack on his domestic enemies, who had rallied beyond the Loire under the leadership of the dauphin Charles—from whom the party, previously known first as Orleanists and then as Armagnacs, gets for the future the name of the "Dauphinois." The English king, however, seeing the manifest advantage of his position, tried to drive too hard a bargain; he demanded the old boundaries of 1360, with his new conquest of Normandy, the hand of the princess Catherine, and a great sum of ready money. Burgundy dared not concede so much, under pain of alienating all his more patriotic supporters. He broke off the conference of Meulan, and tried to patch up a peace with the dauphin, in order to unite all Frenchmen against the foreign invader. This laudable intention was wrecked by the treachery of the young heir to the French throne; on the bridge of Montereau Charles deliberately murdered the suppliant duke, as he knelt to do homage, thinking thereby that he would make an end of the Burgundian party (Sept. 9, 1419).

Treaty of Troyes.—This abominable deed gave northern France for twenty years to an English master. The young duke of Burgundy, Philip the Good, and his supporters in Paris and the north, were so incensed with the dauphin's cruel treachery that they resolved that he should never inherit his father's crown. They proffered peace to King Henry, and offered to recognize his claim to the French throne, on condition that he should marry the princess Catherine and guarantee the constitutional liberties of the realm. The insane Charles VI. should keep nominal possession of the royal title till his death, but meanwhile the Burgundians would do homage to Henry as "heir of France." These terms were welcomed by the English king, and ratified at the treaty of Troyes (May 21, 1420). Henry married the princess Catherine, received the oaths of Duke Philip and his partisans, and started forth to conquer the Dauphinois at the head of an army of which half was composed of Burgundian levies. Paris, Picardy, Champagne, and indeed the greater part of France north of the Loire, acknowledged him as their sovereign.

Henry had only two years longer to live; they were spent in incessant and successful campaigning against the partisans of his brother-in-law, the dauphin Charles; by a long series of sieges the partisans of that worthless prince were evicted from all their northern strongholds. They fought long and bitterly, nor was this to be marvelled at, for Henry had a custom of executing as traitors all who withstood him, and those who had once defied him did well to fight to the last gasp, in order to avoid the block or the halter. In the longest and most desperate of these sieges, that of Meaux (Oct. 1421–March 1422), the king contracted a dysenteric ailment which he could never shake off. He survived for a few months, but died, worn out by his incessant campaigning, on Aug. 31, 1422, leaving the crown of England and the heirship of France to his only child Henry of Windsor, an infant less than two years old.

Few sovereigns in history have accomplished such a disastrous life's work as this much-admired prince. If he had not been a soldier of the first ability and a diplomatist of the most unscrupulous sort, he could never have advanced so far towards his ill-chosen goal, the conquest of France. His genius and the dauphin's murderous act of folly at Montereau conspired to make the incredible almost possible. Indeed, if Henry had lived five years longer, he would probably have carried his arms to the Mediterranean, and have united France and England in uneasy union for some short space of time. It is clear that they could not have been held together after his death, for none but a king of exceptional

powers could have resisted their natural impulse to break apart. As it was, Henry had accomplished just enough to tempt his countrymen to persevere for nearly thirty years in the endeavour to complete the task he had begun. France was ruined for a generation, England was exhausted by her effort, and (what was worse) her governing classes learnt in the long and pitiless war lessons of demoralization which were to bear fruit in the ensuing struggle of the two Roses.

Henry VI.—The guardianship of the infant Henry VI. fell to his two uncles, John of Bedford and Humphrey of Gloucester, the two surviving brothers of the late king. Bedford became regent in France, and took over the heritage of the war, in which he was vigorously aided by the young Philip of Burgundy, whose sister he soon after married. Almost his first duty was to bury the insane Charles VI., who only survived his son-in-law for a few months, and to proclaim his little nephew king of France under the name of Henry II. Gloucester, however, had personal charge of the child, who was to be reared in England; he had also hoped to become protector of the realm, and to use the position for his own private interests, for he was a selfish and ambitious prince. But the council refused to let him assume the full powers of a regent, and bound him with many checks and restrictions, because they were well aware of his character. The tiresome and monotonous domestic history of England during the next twenty years consisted of little else than quarrels between Gloucester and the lords of the council, of whom the chief was the duke's half-uncle Henry Beaufort, bishop of Winchester, the last to survive of all the sons of John of Gaunt. The duke and the bishop were both unscrupulous; but the churchman, with all his faults, was a patriotic statesman, while Gloucester cared far more for his own private ends than for the welfare of the realm.

Bedford's Rule in France.—Meanwhile Bedford, a capable general and a wise administrator, was doing his best to carry out the task which the dying Henry V. had laid upon him, by crushing the dauphin, or Charles VII. as he now called himself since his father's death. As long as the Burgundian party lent the regent their aid, the limits of the land still unsubdued continued to shrink, though the process was slow. Two considerable victories, Cravant (1423) and Verneuil (1424), marked the early years of Bedford's campaigning; at each, it may be noted, a very large proportion of his army was composed of Burgundian auxiliaries. The alliance was threatened by the reckless marriage of Gloucester with Jacqueline, the heiress of Hainault (*q.v.*) whose lands were needed for the rounding off of the Burgundian territories. But Bedford was able to pacify the duke by disassociating himself from his brother's schemes, and the alliance was maintained until the English position in France had been radically altered by the French revival which followed the appearance of Joan of Arc.

Her brief career belongs to French rather than to English history. But it affected the whole future of the war. With the relief of Orleans (1429) the tide turned, and the English began to lose their hold upon the north of France. French victories at Jarqeau and Beaugency (1429) were early signs of the change, and the coronation of Charles VII. was a direct challenge to the French supporters of Henry VI. The movement was not seriously checked by the capture of Joan by the Burgundian allies of England in 1430, and a final English victory became impossible when the duke of Burgundy in 1435 made terms with Charles VII. by the treaty of Arras.

Truce with France.—Bedford died at Rouen immediately afterward, and with him died the best hope of the English party in France, for he had been well loved by the Burgundians, and many had adhered to the cause of Henry VI. solely because of their personal attachment to him. Yet the next eight years of the war were in some respects the most astonishing period of its interminable length. The English fought out the losing game with a wonderful obstinacy. Though every town that they held was eager to revolt, and though they were hopelessly outnumbered in every quarter, they kept a tight grip on the greater part of Normandy, and on their old domain in the Bordelais and about Bayonne. They lost nearly all their outlying possessions, but still made head against the generals of Charles VII. in these two regions. The leaders of this period of the war were the duke of York, and the aged Lord Talbot, afterwards earl of Shrewsbury. The struggle only ceased in 1444, when the English council, in which a peace party had at last been formed, concluded a two-year truce with King Charles, which they hoped to turn into a permanent treaty, on the condition that their king should retain what he held in Normandy and Guienne, but sign away his claim to the French crown, and relinquish the few places outside the two duchies which were still in his power. To mark the reconciliation of the two powers Henry VI. was betrothed to the French king's niece, Margaret of Anjou. The two years' truce was repeatedly prorogued, and lasted till 1449, but no definitive treaty was ever concluded, owing to the bad faith with which both parties kept their promises.

Supremacy of the Beauforts in England.—The government in England was now in the hands of the faction which Bishop Beaufort had originally led, for after long struggles the churchman had at last crushed his nephew Humphrey. King Henry, though he had reached the age of 23 at the time of his marriage, counted for nothing. He was a pious young man, simple to the verge of imbecility; a little later he developed actual insanity, the heritage of his grandfather Charles VI. His wife Margaret of Anjou, though she possessed all the fire and energy which her husband lacked, was equally devoted to these two ministers, and soon came to share their unpopularity.

The truce with France had offended the natural pride of the nation, which still refused to own itself beaten. The evacuation of the French fortresses in Maine and elsewhere, which was the price paid for the suspension of arms, was bitterly resented. Indeed the garrisons had to be threatened with the use of force before they would quit their strongholds. A violent clamour was raised against the ministers responsible for the truce, the dukes of Suffolk and Somerset, and the duke of Gloucester emerged from his retirement to head the agitation. But he was arrested by the order of the queen and the ministers at the parliament of Bury, and five days later he died suddenly in prison. Six weeks afterwards the death of Bishop Henry Beaufort removed the last important survivor from the generation of Henry V. The truce with France lasted two years after the death of Duke Humphrey. In July 1449 the French king invaded Normandy, and in a few months the duchy was lost. The final blow came when a small army of relief sent over from England was absolutely exterminated by the French at the battle of Formigny (April 15, 1450). Somerset, who had retired into Caen, surrendered two months later after a feeble defence, and the English power in northern France came to an end.

Jack Cade's Rebellion.—Even before this final disaster the indignation felt against Suffolk and Somerset had raised violent disturbances at home. Suffolk was impeached, and although allowed to sail for France before his trial, he was intercepted and murdered on the sea. But, though Suffolk was gone, Somerset yet survived, and their partisans still engrossed the confidence of the king. To clear out the government, and punish those responsible for the late disasters, the commons of Kent rose in insurrection under a captain who called himself John Mortimer, though his real name seems to have been John Cade. He was a soldier of fortune who had served in the French wars, and claimed to be in the confidence of the duke of York, the person to whom the eyes of all who hated Somerset and the present régime were now directed.

Cade was not a social reformer, like his predecessor Wat Tyler, with whom he has often been compared, but a politician. Though he called himself "John Amend-all," and promised to put down abuses of every kind, the main part of the programme which he issued was intended to appeal to national sentiment, not to class feeling. Whether he was the tool of other and more highly placed malcontents, or whether he was simply a ready-witted adventurer playing his own game, it is hard to determine. His first success was marvellous; he defeated the king's troops, made a triumphant entry into London and held the city for two days. He beheaded Lord Saye, the treasurer, and several other unpopular persons, and might have continued his dictatorship for some time if the Kentish mob that followed him had not fallen to general

pillage and arson. This led to the same results that had been seen in Tyler's day. The propertied classes in London took arms to suppress anarchy, and beat the insurgents out of the city. Cade, striving to keep up the rising outside the walls, was killed in a skirmish a month later and his bands dispersed.

Richard, Duke of York, Heads the Opposition.—But the troubles of England were only just beginning; the protest against the misgovernment of Somerset and the rest of the confidants of the king and queen was now taken up by a more important personage than the adventurer Cade. Richard, duke of York, the heir to the claims of the house of Mortimer—his mother was the sister of the last earl of March—now placed himself at the head of the opposition. He had plausible grounds for doing so; though he had distinguished himself in the French wars, and was, since the death of Humphrey of Gloucester, the first prince of the blood royal, he had been ignored and flouted by the king's ministers, who had sent him into a kind of honourable banishment as lord-lieutenant of Ireland, and had forbidden him to re-enter the realm. When, in defiance of this mandate, he came home and announced his intention of impeaching Somerset, he took the first step which was to lead to the Wars of the Roses.

Yet he was a cautious and in the main a well-intentioned prince, and the extreme moderation of his original demands seems to prove that he did not at first aim at the crown. He merely required that Somerset and his friends should be dismissed from office and made to answer for their misgovernment. Though he backed his demands by armed demonstration—twice calling out his friends and retainers to support his policy—he carefully refrained for five long years from actual violence. Indeed in 1452 he consented to abandon his protests, and to lend his aid to the other party for a great national object, the recovery of Guienne. For a moment the quarrel of York and Somerset was suspended, and the last English army that crossed the seas during the Hundred Years' War landed in Guienne, and for a time swept all before it. But on July 17, 1453 the veteran earl of Shrewsbury and the greater part of his Anglo-Gascon host were cut to pieces at the hard-fought battle of Castillon. Bordeaux, though left to defend itself, held out for eighty days after Talbot's defeat and death, and then made its final submission to the French. The long struggle was over, and England now retained nothing of her old transmarine possessions save Calais and the Channel Islands. The ambition of Henry V. had finally cost her the long-loyal Guienne, as well as all the ephemeral conquests of his own sword.

The last crowning disaster of the administration of the favourites of Henry VI. put an end to the chance that a way out of domestic strife might be found in the vigorous prosecution of the French war. For the next twenty years the battles of England were to be fought on her own soil, and between her own sons. It was a righteous punishment for her interference in the unnatural strife of Orleanists and Burgundians that the struggle between York and Lancaster was to be as bitter and as bloody as that between the two French factions.

V. THE WARS OF THE ROSES (1453–97)

The Wars of the Roses have been ascribed to many different causes by different historians. To some their origin is mainly constitutional. It is argued that the question of the succession was raised because the king persisted in retaining as his ministers men, such as the duke of Somerset, whom the nation considered responsible for the failure of the French war. To others, the key of the problem is the question of the succession itself. The hereditary claim of Richard duke of York became important when the failure of the French war had discredited the Lancastrian dynasty. From yet a third standpoint, the Wars of the Roses were essentially a fight between two powerful groups of baronial allies. It is at least certain that Richard of York was not merely the head of a constitutional opposition, nor was he merely a legitimist claimant to the crown; he was also the head of a powerful baronial league, of which the most prominent members were his kinsmen, the Nevilles, Mowbrays and Bourchiers. The Nevilles alone, enriched with the ancient estates of the Beauchamps and Montagus, and with five of their name in the House of Lords, were a sufficient nucleus for a faction. They were headed by the two most capable politicians and soldiers then alive in England, the two Richards, father and son, who held the earldoms of Salisbury and Warwick, and were respectively brother-in-law and nephew to York. It must be remembered that a baron of 1450 was not strong merely by reason of the spears and bows of his household and his tenantry, like a baron of the 13th century. The pernicious practice of "livery and maintenance" was now at its zenith; all over England in times of stress the knighthood and gentry were wont to pledge themselves, by sealed bonds of indenture, to follow the magnate whom they thought best able to protect them. A soldier and statesman of the ability and ambition of Richard of Warwick counted hundreds of such adherents, scattered over twenty shires. An alliance of half-a-dozen of these over-powerful subjects was a serious danger to the crown, for the king could no longer count on raising a national army against them.

Defeat of the Lancastrians at Northampton.—Despite all this, there was still, when the wars began, a very strong feeling in favour of compromise and moderation. For this there can be no doubt that Richard of York was mainly responsible. When he was twice placed in power, during the two protectorates which followed Henry's two long fits of insanity in 1454 and 1455–56, he carefully avoided any oppression of his enemies, though he naturally took care to put his own friends in office. Most of all did he show his sincere wish for peace by twice laying down the protectorate when the king was restored to sanity. He was undoubtedly goaded into his last rebellion of 1459 by the queen's undisguised preparations for attacking him. Yet because he struck first, without waiting for a definite *casus belli,* public opinion declared so much against him that half his followers refused to rally to his banner. The revulsion only came when the queen, victorious after the rout of Ludford, applied to the vanquished Yorkists those penalties of confiscation and attainder which Duke Richard had always refused to employ in his day of power. After the harsh doings at the parliament of Coventry (1459), and the commencement of political executions by the sending of Roger Neville and his fellows to the scaffold, the trend of public opinion veered round, and Margaret and her friends were rightly held responsible for the embittered nature of the strife. Hence came the marvellous success of the Yorkist counterstroke in June 1460, when the exiled Warwick, landing in Kent with a mere handful of men, was suddenly joined by the whole of the south of England and the citizens of London, and inflicted a crushing defeat on the Lancastrians at Northampton before he had been fifteen days on shore (July 10, 1460). The growing rancour of the struggle was marked by the fact that the Yorkists, after Northampton, showed themselves by no means so scrupulous as in their earlier days. Retaliatory executions began, though on a small scale, and when York reached London he at last began to talk of his rights to the crown, and to propose the deposition of Henry VI. Yet moderation was still so far prevalent in the ranks of his adherents that they refused to follow him to such lengths. Warwick and the other leading men of the party dictated a compromise, by which Henry was to reign for the term of his natural life, but Duke Richard was to be recognized as his heir and to succeed him on the throne. They had obviously borrowed the expedient from the terms of the treaty of Troyes. But the act of parliament which embodied it did not formally disinherit the reigning king's son, as the treaty of Troyes had done, but merely ignored his existence.

Battle of Wakefield. Richard of York Slain.—It would have been well for England if this agreement had held, and the crown had passed peaceably to the house of York, after the comparatively short and bloodless struggle which had just ended. But Duke Richard had forgotten to reckon with the fierce and unscrupulous energy of Queen Margaret, when she was at bay in defence of her son's rights. Marching with a trifling force to expel her from the north, he was surprised and slain at Wakefield (Dec. 30, 1460). But it was not his death that was the main misfortune, but the fact that in the battle the Lancastrians gave no quarter to small or great, and that after it they put to death

York's brother-in-law Salisbury and other prisoners. The heads of the duke and the earl were set up over the gates of York. This ferocity was repeated when Margaret and her northern host beat Warwick at the second battle of St. Albans (Feb. 17, 1461), where they had the good fortune to recover possession of the person of King Henry. Lord Bonville and the other captives of rank were beheaded next morning.

Edward, Earl of March, Proclaimed as Edward IV.—After this it was but natural that the struggle became a mere record of massacres and executions. The Yorkists proclaimed Edward, Duke Richard's heir, king of England; they took no further heed of the claims of King Henry, declared their leader the true successor of Richard II., and stigmatized the whole period of the Lancastrian rule as a mere usurpation. They adopted a strict legitimist theory of the descent of the crown, and denied the right of parliament to deal with the succession. This was the first step in the direction of absolute monarchy which England had seen since the short months of King Richard's tyranny in 1397–99. It was but the first of many encroachments of the new dynasty upon the liberties that had been enjoyed by the nation under the house of Lancaster.

The revenge taken by the new king and his cousin Richard of Warwick for the slaughter at Wakefield and St. Albans was prompt and dreadful. They were now well supported by the whole of southern England; for not only had the queen's ferocity shocked the nation, but the reckless plundering of her northern moss-troopers in the home counties had roused the peasantry and townsfolk to an interest in the struggle which they had never before displayed. Up to this moment the civil war had been conducted like a great faction fight; the barons and their liveried retainers had been wont to seek some convenient heath or hill and there to fight out their quarrel with the minimum of damage to the countryside. The deliberate harrying of the Midlands by Margaret's northern levies was a new departure, and one bitterly resented. The Yorkist army that marched in pursuit of the raiders, and won the bloody field of Towton under Warwick's guidance, gave no quarter. Not only was the slaughter in that battle and the pursuit more cruel than anything that had been seen since the day of Evesham, but the executions that followed were ruthless. Ere Edward turned south he had beheaded two earls—Devon and Wiltshire—and forty-two knights, and had hanged many prisoners of lesser estate. The Yorkist parliament of November 1461 carried on the work by attainting 133 persons, ranging from Henry VI. and Queen Margaret down through the peerage and the knighthood to the clerks and household retainers of the late king. All the estates of the Lancastrian lords, living or dead, were confiscated, and their blood was declared corrupted. This brought into the king's hands such a mass of plunder as no one had handled since William the Conqueror. Edward IV. could not only reward his adherents with it, so as to create a whole new court *noblesse*, but had enough over to fill his exchequer for many years, and to enable him to dispense with parliamentary grants of money for an unexampled period. Between 1461 and 1465 he asked for only £37,000 from the nation—and won no small popularity thereby. For, in their joy at being quit of taxation, men forgot that they were losing the lever by which their fathers had been wont to move the crown to constitutional concessions.

Civil War in the North and West.—After Towton peace prevailed south of the Tyne and east of the Severn, for it was only in Northumberland and in Wales that the survivors of the Lancastrian faction succeeded in keeping the war alive. King Edward, as indolent and pleasure-loving in times of ease as he was active and ruthless in times of stress and battle, set himself to enjoy life, handing over the suppression of the rebels to his ambitious and untiring cousin Richard of Warwick. The annals of the few contemporary chroniclers are so entirely devoted to the bickerings in the extreme north and west, that it is necessary to insist on the fact that from 1461 onwards the civil war was purely local. The campaigns of 1462–63–64, though full of incident and bloodshed, were not of first-rate political importance. The cause of Lancaster had been lost at Towton, and all that Queen Margaret succeeded in accomplishing was to keep Northumberland in revolt, mainly by means of French and Scottish succours. Her last English partisans, attainted men who had lost their lands and lived with the shadow of the axe ever before them, fought bitterly enough. But the obstinate and hard-handed Warwick beat them down again and again, and the old Lancastrian party was almost exterminated when the last of its chiefs went to the block in the series of wholesale executions that followed the battle of Hexham (May 15, 1464). A year later Henry VI. himself fell into the hands of his enemies, as he lurked in Lancashire, and with his consignment to the Tower the dynastic question seemed finally solved in favour of the house of York.

Richard Neville, Earl of Warwick.—The first ten years of the reign of Edward IV. fall into two parts, the dividing point being the avowal of the king's marriage to Elizabeth Woodville in November 1464. During the first of these periods Edward reigned but Warwick governed; he was not only the fighting man, but the statesman and diplomatist of the Yorkist party, and enjoyed a complete ascendancy over his young master, who long preferred thriftless ease to the toils of personal monarchy. Warwick represented the better side of the victorious cause; he was no mere factious king-maker, and his later nickname of "the last of the barons" by no means expresses his character or his position. He was strong, not so much by reason of his vast estates and his numerous retainers, as by reason of the confidence which the greater part of the nation placed in him. He never forgot that the Yorkist party had started as the advocates of sound and strong administration, and the mandatories of the popular will against the queen's incapable and corrupt ministers. "He ever had the goodwill of the people because he knew how to give them fair words, and always spoke not of himself but of the augmentation and good governance of the kingdom, for which he would spend his life; and thus he had the goodwill of England, so that in all the land he was the lord who was held in most esteem and faith and credence." As long as he remained supreme, parliaments were regularly held, and the house of York appeared to be keeping its bargain with the nation. His policy was sound; peace with France, the rehabilitation of the dwindling foreign trade of England, and the maintenance of law and justice by strong-handed governance were his main aims.

But Warwick was one of those ministers who love to do everything for themselves, and chafe at masters and colleagues who presume to check or to criticize their actions. He was surrounded and supported, moreover, by a group of brothers and cousins, to whom he gave most of his confidence, and most of the preferment that came to his hands. England has always chafed against a family oligarchy, however well it may do its work. The Yorkist magnates who did not belong to the clan of the Nevilles were not unnaturally jealous of that house, and Edward IV. himself gradually came to realize the ignominious position of a king who is managed and overruled by a strong-willed and arbitrary minister.

Breach Between Warwick and the King.—His first sign of revolt was his secret marriage to Elizabeth Woodville, a lady of decidedly Lancastrian connections, for her father and her first husband were both members of the defeated faction. Warwick was at the moment suing for the hand of Louis XI.'s sister-in-law in his master's name, and had to back out of his negotiations in a sudden and somewhat ridiculous fashion. His pride was hurt, but for two years more there was no open breach between him and his master, though their estrangement grew more and more marked when Edward continued to heap titles and estates on his wife's numerous relatives, and to conclude for them marriage alliances with all the great Yorkist families who were not of the Neville connection. In this way he built up for himself a personal following within the Yorkist party; but the relative strength of this faction and of that which still looked upon Warwick as the true representative of the cause had yet to be tried. The king had in his favour the prestige of the royal name, and a popularity won by his easy-going affability and his liberal gifts. The earl had his established reputation for disinterested devotion to the welfare of the realm, and his brilliant record as a soldier and statesman. In districts as far apart as Kent and Yorkshire, his word counted for a good deal more than that of his sovereign.

Warwick Organizes a Rebellion.—Unhappily for England and for himself, Warwick's loyalty was not sufficient to restrain his ambition and his resentment. He felt the ingratitude of the king, whom he had made, so bitterly that he stooped ere long to intrigue and treason. Edward in 1467 openly broke with him by dismissing his brother George Neville from the chancellorship, by repudiating a treaty with France which the earl had just negotiated, and by concluding an alliance with Burgundy against which he had always protested. Warwick enlisted in his cause the king's younger brother George of Clarence, who desired to marry his daughter and heiress Isabella Neville, and with the aid of this unscrupulous but unstable young man began to organize rebellion. His first experiment in treason was the so-called "rising of Robin of Redesdale," which was ostensibly an armed protest by the gentry and commons of Yorkshire against the maladministration of the realm by the king's favourites—his wife's relatives, and the courtiers whom he had lately promoted to high rank and office. The rebellion was headed by well-known adherents of the earl, and the nickname of "Robin of Redesdale" seems to have covered the personality of his kinsman Sir John Conyers. When the rising was well started Warwick declared his sympathy with the aims of the insurgents, wedded his daughter to Clarence despite the king's prohibition of the match, and raised a force at Calais with which he landed in Kent.

But his plot was already successful before he reached the scene of operations. The Yorkshire rebels beat the royalist army at the battle of Edgecott (July 6, 1469). A few days later Edward himself was captured at Olney and put into the earl's hands. Many of his chief supporters, including the queen's father, Lord Rivers, and her brother, John Woodville, as well as the newly-created earls of Pembroke and Devon, were put to death with Warwick's connivance, if not by his direct orders. The king was confined for some weeks in the great Neville stronghold of Middleham Castle, but presently released on conditions, being compelled to accept new ministers nominated by Warwick. The earl supposed that his cousin's spirit was broken and that he would give no further trouble. In this he erred grievously. Edward vowed revenge for his slaughtered favourites, and waited his opportunity. Warwick had lost credit by using such underhand methods in his attack on his master, and had not taken sufficient care to conciliate public opinion when he reconstructed the government. His conduct had destroyed his old reputation for disinterestedness and honesty.

Warwick in Exile Takes Up the Cause of Henry VI.—In March 1470 the king seized the first chance of avenging himself. Some unimportant riots had broken out in Lincolnshire, originating probably in mere local quarrels, but possibly in Lancastrian intrigues. To suppress this rising the king gathered a great force, carefully calling in to his banner all the peers who were offended with Warwick or, at any rate, did not belong to his family alliance. Having scattered the Lincolnshire bands, he suddenly turned upon Warwick with his army, and caught him wholly unprepared. The earl and his son-in-law Clarence were hunted out of the realm before they could collect their partisans, and fled to France: Edward seemed for the first time to be master in his own realm.

But the Wars of the Roses had one more phase to come. Warwick's name was still a power in the land, and his expulsion had been so sudden that he had not been given an opportunity of trying his strength. His old enmity for the house of Lancaster was completely swallowed up in his new grudge against the king whom he had made. He opened negotiations with the exiled Queen Margaret, and offered to place his sword at her disposition for the purpose of overthrowing King Edward and restoring King Henry. The queen had much difficulty in forcing herself to come to terms with the man who had been the bane of her cause, but finally, was induced by Louis XI. to conclude a bargain. Warwick married his younger daughter to her son Edward, prince of Wales, as a pledge of his good faith, and swore allegiance to King Henry in the cathedral of Angers. He then set himself to stir up the Yorkshire adherents of the house of Neville to distract the attention of Edward IV. When the king had gone northward to attack them, the earl landed at Dartmouth (Sept. 1470) with a small force partly composed of Lancastrian exiles, partly of his own men. His appearance had the effect on which he had calculated. Devon rose in the Lancastrian interest; Kent, where the earl's name had always been popular, took arms a few days later; and London opened its gates. King Edward, hurrying south to oppose the invader, found his army melting away from his banner, and hastily took ship at Lynn and fled to Holland. He found a refuge with his brother-in-law and ally, Charles the Bold, the great duke of Burgundy.

Restoration of Henry VI.—King Henry was released and replaced on the throne, and for six months Warwick ruled England as his lieutenant. But there was bitterness and mistrust between the old Lancastrian faction and the Nevilles, and Queen Margaret refused to cross to England or to trust her son in the king-maker's hands. Her partisans doubted his sincerity, while many of the Yorkists who had hitherto followed Warwick in blind admiration found it impossible to reconcile themselves to the new régime. The duke of Clarence in particular, discontented at the triumph of Lancaster, betrayed his father-in-law, and opened secret negotiations with his exiled brother. Encouraged by the news of the dissensions among his enemies, Edward IV. resolved to try his fortune once more, and landed near Hull on March 15, 1471 with a body of mercenaries lent him by the duke of Burgundy.

Battle of Barnet. Death of Warwick.—The campaign that followed was most creditable to Edward's generalship, but must have been fatal to him if Warwick had been honestly supported by his lieutenants. But the duke of Clarence betrayed to his brother the army which had gathered in King Henry's name, and many of the Lancastrians were slow to join the earl, from their distrust of his loyalty. Edward, dashing through the midst of the slowly gathering levies of his opponents, seized London, and two days later defeated and slew Warwick at the battle of Barnet (April 13, 1471).

Battle of Tewkesbury. Death of Edward, Prince of Wales and Murder of Henry VI.—On the same day Queen Margaret and her son landed at Weymouth, only to hear that the earl was dead and his army scattered. But she refused to consider the struggle ended, and gathered the Lancastrians of the west for a final rally. On the fatal day of Tewkesbury (May 3, 1471) her army was beaten, her son was slain in the flight, and the greater part of her chief captains were taken prisoners. She herself was captured next day. The victorious Edward sent to the block the last Beaufort duke of Somerset, and nearly all the other captains of rank, whether Lancastrians or followers of Warwick. He then moved to London, which was being threatened by Kentish levies raised in Warwick's name, delivered the city, and next day caused the unhappy Henry VI. to be murdered in the Tower (May 21, 1471).

The Reign of Edward IV.—The descendants of Henry IV. were now extinct, and the succession question seemed settled for ever. No one dreamed of raising against King Edward the claims of the remoter heirs of John of Gaunt—the young earl of Richmond, who represented the Beauforts by a female descent, or the king of Portugal, the grandson of Gaunt's eldest daughter. Edward was now king indeed, with no over-powerful cousin at his elbow to curb his will. He had, moreover, at his disposal plunder almost as valuable as that which he had divided up in 1461—the estates of the great Neville clan and their adherents. A great career seemed open before him; he had proved himself a fine soldier and an unscrupulous diplomatist; he was in the very prime of life, having not yet attained his thirty-first year. He might have devoted himself to foreign politics and have rivalled the exploits of Edward III. or Henry V.—for the state of the continent was all in his favour—or might have set himself to organize an absolute monarchy on the ruins of the parliament and the baronage. For the successive attainders of the Lancastrians and the Nevilles had swept away many of the older noble families, and Edward's house of peers consisted for the main part of new men, his own partisans promoted for good service, who had not the grip on the land that their predecessors had possessed.

But Edward either failed to see his opportunity or refused to

take it. He did not plunge headlong into the wars of Louis XI. and Charles of Burgundy, nor did he attempt to recast the institutions of the realm. He settled down into inglorious ease, varied at long intervals by outbursts of spasmodic tyranny. It would seem that the key to his conduct was that he hated the hard work without which a despotic king cannot hope to assert his personality, and preferred leisure and vicious self-indulgence. In many ways the later years of his reign were marked with all the signs of absolutism. Between 1475 and 1483 he called only one single parliament, and that was summoned not to give him advice, or to raise him money, but purely and solely to attaint his brother Clarence, whom he had resolved to destroy. The duke's fate (Feb. 17, 1478) need provoke no sympathy; he was a detestable intriguer, and had given his brother just offence by a series of deeds of high-handed violence and by perpetual cavilling. But he had committed no act of real treason since his long-pardoned alliance with Warwick, and was not in any way dangerous; so that when the king caused him to be attainted, and then privately murdered in the Tower, there was little justification for the fratricide.

Edward was a thrifty king; he was indeed the only mediaeval monarch of England who succeeded in keeping free of debt and made his revenue suffice for his expenses. But his methods of filling his purse were often unconstitutional and sometimes ignominious. When the resources drawn from confiscations were exhausted, he raised "benevolences"—forced gifts extracted from men of wealth by the unspoken threat of the royal displeasure—instead of applying to parliament for new taxes. But his most profitable source of revenue was drawn from abroad. Having allied himself with his brother-in-law Charles of Burgundy against the king of France, he led an army into Picardy in 1475, and then by the treaty of Picquigny sold peace to Louis XI. for 75,000 gold crowns down, and an annual pension (or tribute as he preferred to call it) of 50,000 crowns more. It was regularly paid up to the last year of his reign. Charles the Bold, whom he had thus deliberately deserted in the middle of their joint campaign, used the strongest language about this mean act of treachery, and with good cause. But the king cared not when his pockets were full. Another device of Edward for filling his exchequer was a very stringent enforcement of justice; small infractions of the laws being made the excuse for exorbitant fines. This was a trick which Henry VII. was to turn to still greater effect. In defence of both it may be pleaded that after the anarchy of the Wars of the Roses a strong hand was needed to restore security for life and property, and that it was better that penalties should be over-heavy rather than that there should be no penalties at all. Another appreciable source of revenue to Edward was his private commercial ventures. He owned many ships, and traded with great profit to himself abroad, because he could promise, as a king, advantages to foreign buyers and sellers with which no mere merchant could compete.

During the last period of Edward's rule England might have been described as a despotism, if only the king had cared to be a despot. But except on rare occasions he allowed his power to be disguised under the old machinery of the mediaeval monarchy, and made no parade of his autocracy. Much was pardoned by the nation to one who gave them comparatively efficient and rather cheap government, and who was personally easy of access, affable and humorous. It is with little justification that he has been called the "founder of the new monarchy," and the spiritual ancestor of the Tudor despotism. Another king in his place might have merited such titles, but Edward was too careless, too unsystematic, too lazy, and too fond of self-indulgence to make a real tyrant. He preferred to be a man of pleasure and leisure, only awaking now and then to perpetrate some act of arbitrary cruelty.

Richard, Duke of Gloucester.—The uneventful latter half of the reign of Edward IV. ended with his death at the age of forty-one on April 9, 1483. He had ruined a splendid constitution by the combination of sloth and evil living. Since Clarence's death he had been gradually falling into the habit of transferring the conduct of great matters of State to his active and hard-working youngest brother, Richard, duke of Gloucester, who had served him well and faithfully ever since he first took the field at Barnet. Gloucester passed as a staid and religious prince, and if there was blood on his hands, the same could be said of every statesman of his time. His sudden plunge into crime and usurpation after his brother's death was wholly unexpected by the nation. Indeed it was his previous reputation for loyalty and moderation which made his scandalous *coup d'état* of 1483 possible. No prince with a sinister reputation would have had the chance of executing the series of crimes which placed him on the throne. But when Richard declared that he was the victim of plots and intrigues, and was striking down his enemies only to defend his own life and honour, he was for some time believed.

At the moment of King Edward's death his elder son by Elizabeth Woodville, Edward, prince of Wales, was twelve; his younger son Richard, duke of York, was nine. It was clear that there would be a long minority, and that the only possible claimants for the regency were the queen and Richard of Gloucester. Elizabeth was personally unpopular, and the rapacity and insolence of her family was well known. Hence when Richard of Gloucester seized on the person of the young king, and imprisoned Lord Rivers and Sir Richard Grey, the queen's brother and son, on the pretence that they were conspiring against him, his action was regarded with equanimity by the people. Nor did the fact that the duke took the title of "protector and defender of the realm" cause any surprise. Suspicions only became rife after Richard had seized and beheaded without any trial, Lord Hastings, the late king's most familiar friend, and had arrested at the same moment the archbishop of York, Morton, bishop of Ely, and Lord Stanley, all persons of unimpeachable loyalty to the house of Edward IV. It was not plausible to accuse such persons of plotting with the queen to overthrow the protector, and public opinion began to turn against Gloucester. Nevertheless he went on recklessly with his design, having already enlisted the support of a party of the greater peers, who were ready to follow him to any length of treason. These confidants, the duke of Buckingham, the lords Howard and Lovel, and a few more, must have known from an early date that he was aiming at the crown, though it is improbable that they suspected that his plan involved the murder of the rightful heirs as well as mere usurpation.

Richard III. Crowned.—On June 16, Richard, using the aged archbishop Bourchier as his tool, got the little duke of York out of his mother's hands, and sent him to join his brother in the Tower. A few days later, having packed London with his own armed retainers and those of Buckingham and his other confidants, he openly put forward his pretensions to the throne. Edward IV., as he asserted, had been privately contracted to Lady Eleanor Talbot before he ever met Queen Elizabeth. His children therefore were bastards, the offspring of a bigamous union. As to the son and daughter of the duke of Clarence, their blood had been corrupted by their father's attainder, and they could not be reckoned as heirs to the crown. He himself, therefore, was the legitimate successor of Edward IV. This preposterous theory was set forth by Buckingham, first to the mayor and corporation of London, and next day to an assembly of the estates of the realm held in St. Paul's. Cowed by the show of armed force, and remembering the fate of Hastings, the two assemblies received the claim with silence which gave consent. Richard, after a hypocritical show of reluctance, allowed himself to be saluted as king, and was crowned on July 6, 1483. Before the coronation ceremony he had issued orders for the execution of the queen's relatives, who had been in prison since the beginning of May. He paid his adherents lavishly for their support, making Lord Howard duke of Norfolk, and giving Buckingham enormous grants of estates and offices.

Murder of the Princes.—Having accomplished his *coup d'état* Richard started for a royal progress through the Midlands, and a few days after this departure sent back secret orders to London for the murder of his two nephews in the Tower. There is no reason to doubt that they were secretly smothered on or about July 15 by his agent Sir James Tyrrell, or that the bones found buried under a staircase in the fortress two hundred years after-

ward belonged to the two unhappy lads. But the business was kept dark at the time, and it was long before any one could assert with certainty that they were dead or alive. Richard never published any statement as to their end, though some easy tale of a fever, a conflagration, or an accident might have served better than the mere silence that he employed. For while many persons believed that the princes still existed there was room for all manner of impostures and false rumours.

Buckingham's Rebellion.—The usurper's reign was from the first a troubled one. Less than three months after his coronation the first insurrection broke out; it was headed—strangely enough—by the duke of Buckingham, who seems to have been shocked by the murder of the princes; he must have been one of the few who had certain information of the crime. He did not take arms in his own cause, though after the house of York the house of Buckingham had the best claim to the throne, as representing Thomas of Woodstock, the youngest son of Edward III. His plan was to unite the causes of York and Lancaster by wedding the Lady Elizabeth, the eldest sister of the murdered princes, to Henry Tudor, earl of Richmond, a young exile who represented the very doubtful claim of the Beauforts to the Lancastrian heritage. Henry was the son of Margaret Beaufort, the daughter of John, first duke of Somerset, and the niece of Edmund, second duke, who fell at St. Albans. All her male kinsmen had been exterminated in the Wars of the Roses.

This promising scheme was to be supported by a rising of those Yorkists who rejected the usurpation of Richard III., and by the landing on the south coast of Henry of Richmond with a body of Lancastrian exiles and foreign mercenaries. But good organization was wanting, and chance fought for the king. A number of scattered risings in the south were put down by Richard's troops, while Buckingham, who had raised his banner in Wales, was prevented from bringing aid by a week of extraordinary rains which made the Severn impassable. Finding that the rest of the plan had miscarried, Buckingham's retainers melted away from him, and he was forced to fly. A few days later he was betrayed, handed over to the king, and beheaded (Nov. 2, 1483). Meanwhile Richmond's little fleet was dispersed by the same storms that scattered Buckingham's army, and he was forced to return to Brittany without having landed in England.

Here King Richard's luck ended. Though he called a parliament early in 1484, and made all manner of gracious promises of good governance, he felt that his position was insecure. The nation was profoundly disgusted with his unscrupulous policy, and the greater part of the leaders of the late insurrection had escaped abroad and were weaving new plots. Early in the spring he lost his only son and heir, Edward, prince of Wales, and the question of the succession to the crown was opened from a new point of view. After some hesitation Richard named his nephew John de la Pole, earl of Lincoln, a son of his sister, as his heir. But he also bethought him of another and a most repulsive plan for strengthening his position. His queen, Anne Neville, the daughter of the kingmaker, was on her death-bed. With indecent haste he began to devise a scheme for marrying his niece Elizabeth, whose brothers he had murdered but a year before. Knowledge of this scheme is said to have shortened the life of the unfortunate Anne, and many did not scruple to say that her husband had made away with her.

Battle of Bosworth.—When the queen was dead, and some rumours of the king's intentions got abroad, the public indignation was so great that Richard's councillors had to warn him to disavow the projected marriage, if he wished to retain a single adherent. He yielded, and made public complaint that he had been slandered—which few believed. Meanwhile the conspirators of 1483 were busy in organizing another plan of invasion. This time it was successfully carried out, and the earl of Richmond landed at Milford Haven with many exiles, both Yorkists and Lancastrians, and 1,000 mercenaries lent him by the princess regent of France. The Welsh joined him in great numbers, not forgetting that by his Tudor descent he was their own kinsman, and when he reached Shrewsbury English adherents also began to flock to his banner, for the whole country was seething with discontent, and Richard III. had but few loyal adherents. When the rivals met at Bosworth Field (Aug. 22, 1485) the king's army was far the larger, but the greater part of it was determined not to fight. When battle was joined some left the field and many joined the pretender. Richard, however, refused to fly, and was slain, fighting to the last, along with the duke of Norfolk and a few other of his more desperate partisans. The slaughter was small, for treason, not the sword, had settled the day. The battered crown which had fallen from Richard's helmet was set on the victor's head by Lord Stanley, the chief of the Yorkist peers who had joined his standard, and his army hailed him by the new title of Henry VII.

Henry VII.—No monarch of England since William the Conqueror, not excluding Stephen and Henry IV., could show such a poor title to the throne as the first of the Tudor kings. His claim to represent the house of Lancaster was of the weakest—when Henry IV. had assented to the legitimating of his brothers the Beauforts, he had attached a clause to the Act, to provide that they were given every right save that of counting in the line of succession to the throne. The true heir to the house of John of Gaunt should have been sought among the descendants of his eldest legitimate daughter, not among those of his base-born sons. The earl of Richmond had been selected by the conspirators as their figure-head mainly because he was known as a young man of ability, and because he was unmarried and could therefore take to wife the princess Elizabeth, and so absorb the Yorkist claim in his own. This had been the essential part of the bargain, and Henry was ready to carry it out, but he insisted that he should first be recognized as king in his own right, lest it might be held that he ruled merely as his destined wife's consort. He was careful to hold his first parliament and get his title acknowledged before he married the princess. When he had done so, he had the triple claim by conquest, by election and by inheritance, safely united. Yet his position was even then insecure; the vicissitudes of the last 30 years had shaken the old prestige of the name of king, and a weaker and less capable man than Henry Tudor might have failed to retain the crown that he had won. There were plenty of possible pretenders in existence; the earl of Lincoln, whom Richard III. had recognized as his heir, was still alive; the two children of the duke of Clarence might be made the tools of conspirators; and there was a widespread doubt as to whether the sons of Edward IV. had actually died in the Tower. The secrecy with which their uncle had carried out their murder was destined to be a sore hindrance to his successor.

Bosworth field is often treated as the last act of the Wars of the Roses. This is an error; they were protracted for 12 years after the accession of Henry VII., and did not really end till the time of Blackheath Field and the siege of Exeter (1497). The position of the first Tudor king is misconceived if his early years are regarded as a time of strong governance and well-established order. On the contrary he was in continual danger, and was striving with all the resources of a ready and untiring mind to rebuild foundations that were absolutely rotten. Phenomena like the Cornish revolt (which recalls Cade's insurrection) and the Yorkshire rising of 1489, which began with the death of the earl of Northumberland, show that at any moment whole counties might take arms in sheer lawlessness, or for some local grievance. Loyalty was such an uncertain thing that the king might call out great levies yet be forced to doubt whether they would fight for him—at Stoke field it seems that a large part of Henry's army misbehaved, much as that of Richard III. had done at Bosworth. The demoralization brought about by the evil years between 1453 and 1483, could not be lived down in a day—any sort of treason was possible to the generation that had seen the career of Warwick and the usurpation of Gloucester. The survivors of that time were capable of taking arms for any cause that offered a chance of unreasonable profit, and no-one's loyalty could be trusted. Did not Sir William Stanley, the best paid of those who betrayed Richard III., afterwards lose his head for a deliberate plot to betray Henry VII.? The various attempts that were made to overturn the new dynasty seem contemptible to the historian of the 20th century. They were not so contemptible at the time, because England and Ireland

were full of adventurers who were ready to back any cause, and who looked on the king of the moment as no more than a successful member of their own class—a base-born Welshman who had been lucky enough to become the figurehead of the movement that had overturned an unpopular usurper. The organizing spirits of the early troubles of the reign of Henry VII. were irreconcilable Yorkists who had suffered by the change of dynasty; but their hopes of success rested less on their own strength than on the not ill-founded notion that England would tire of any ruler who had to raise taxes and reward his partisans. The position bore a curious resemblance to that of the early years of Henry IV., a king who, like Henry VII., had to vindicate a doubtful elective title to the throne by miracles of cunning and activity. The later representative of the house of Lancaster was fortunate, however, in having less formidable enemies than the earlier; the power of the baronage had been shaken by the Wars of the Roses no less than the power of the Crown; so many old estates had passed rapidly from hand to hand, so many old titles were represented by upstarts destitute of local influence, that the feudal danger had become far less. Risings like that of the Percies in 1403 were not the things which the seventh Henry had to fear. He was lucky too in having no adversary of genius of the type of Owen Glendower. Welsh national spirit indeed was enlisted on his own side. Yet leaderless seditions and the plots of obvious imposters sufficed to make his throne tremble, and a ruler less resolute, less wary, and less unscrupulous might have been overthrown.

Lambert Simnel.—The first of the king's troubles was an abortive rising in the north riding of Yorkshire, the only district where Richard III. seems to have enjoyed personal popularity. It was led by Lord Lovel, Richard's chamberlain and admiral; but the insurgents dispersed when Henry marched against them with a large force (1486), and Lovel took refuge in Flanders with Margaret of York, the widow of Charles the Bold of Burgundy, whose dower towns were the refuge of all English exiles, and whose coffers were always open to subsidize plots against her niece's husband. Under the auspices of this rancorous princess the second conspiracy was hatched in the following year (1487). Its leaders were Lovel and John, earl of Lincoln, whom Richard III. had designated as his heir. But the Yorkist banner was to be raised, not in the name of Lincoln, but in that of the boy Edward of Clarence, then a prisoner in the Tower. His absence and captivity might seem a fatal hindrance, but the conspirators had prepared a "double" who was to take his name till he could be released. This was a lad named Lambert Simnel, the son of an Oxford organmaker, who bore a personal resemblance to the young captive. The conspirators seem to have argued that Henry VII. would not proceed to murder the real Edward, but would rather exhibit him to prove the imposition; if he took the more drastic alternative Lincoln could fall back on his own claim to the crown.

In May 1487 Lincoln and Lovel landed in Ireland accompanied by other exiles and 2,000 German mercenaries. The cause of York was popular in the Pale, and the Anglo-Irish barons seem to have conceived the notion that Henry VII. was likely to prove too strong and capable a king to suit their convenience. The invading army was welcomed by almost all the lords, and the spurious Clarence was crowned at Dublin by the name of Edward VI. A few weeks later Lincoln had recruited his army with 4,000 or 5,000 Irish adventurers under Thomas Fitzgerald, son of the earl of Kildare, and had taken ship for England. He landed in Lancashire, and pushed forward, hoping to gather the English Yorkists to his aid. But few had joined him when King Henry brought him to action at Stoke, near Newark, on July 17. Despite the doubtful conduct of part of the royal army, and the fierce resistance of the Germans and Irish, the rebel army was routed. Lincoln and Fitzgerald were slain; Lovel disappeared in the rout; the young imposter Simnel was taken prisoner. Henry treated him with politic contempt, and made him a cook boy in his kitchen. He lived for many years after in the royal household. The Irish lords were pardoned on renewing their oaths of fealty; the king did not wish to entangle himself in costly campaigns beyond St. George's channel till he had made his position in England more stable.

The Yorkist cause was crushed for four years, till it was raised again by Margaret of Burgundy, with an imposture even more preposterous than that of Lambert Simnel. In the intervening space, however, while Henry VII. was comparatively undisturbed by domestic rebellion, he found opportunity for a first tentative experiment at interfering in European politics. He allied himself with Ferdinand and Isabella of Spain and with Maximilian of Austria, who was ruling the Netherlands in behalf of his young son, Philip, the heir of the Burgundian inheritance, for the purpose of preventing France from annexing Brittany, the last great fief of the crown which had not yet been absorbed into the Valois royal domain. This struggle, the only Continental war in which the first of the Tudors risked his fortunes, was not prosecuted with any great energy, and came to a necessary end when Anne, duchess of Brittany, in whose behalf it was being waged, disappointed her allies by marrying Charles VIII. of her own free-will (Dec. 1491). Henry very wisely proceeded to get out of the war on the best terms possible, and, to the disgust of Maximilian, sold peace to the French king for 600,000 crowns, as well as an additional sum representing arrears of the pension which Louis XI. had been bound to pay to Edward IV. This treaty of Etaples was, in short, a repetition of Edward's treaty of Picquigny, equally profitable and less disgraceful, for Maximilian of Austria, whom Henry thus abandoned, had given more cause of offence than had Charles of Burgundy in 1475. Domestic malcontents did not scruple to hint that the king, like his father-in-law before him, had made war on France, not with any hope of renewing the glories of Creçy or Agincourt, still less with any design of helping his allies, but purely to get first grants from his parliament, and then a war indemnity from his enemies. In any case he was wise to make peace. France was now too strong for England, and both Maximilian and Ferdinand of Spain were selfish and shifty allies. Moreover, it was known that the one dominating desire of Charles VIII. was to conquer Italy, and it was clear that his ambitions in that direction were not likely to prove dangerous to England.

Perkin Warbeck.—In the year of the treaty of Etaples the Yorkist conspiracies began once more to thicken, and Henry was fortunate to escape with profit from the French war before his domestic troubles recommenced. Ever since 1483 it had been rumoured that one or both of the sons of Edward IV. had escaped, not having been murdered in the Tower. Of this widespread belief the plotters now took advantage; they held that much more could be accomplished with such a claim than by using that of the unfortunate Edward of Clarence, whose chances were so severely handicapped by his being still the prisoner of Henry VII. The scheme for producing a false Plantagenet was first renewed in Ireland, where Simnel's imposture had been so easily taken up a few years before. The tool selected was one Perkin Warbeck, a handsome youth of 17 or 18, the son of a citizen of Tournai, who had lived for some time in London, where Perkin had actually been born. There is a bare possibility that the young adventurer may have been an illegitimate son of Edward IV.; his likeness to the late king was much noticed. When he declared himself to be Richard of York, he obtained some support in Ireland from the earl of Desmond and other lords; but he did not risk open rebellion till he had visited Flanders, and had been acknowledged as her undoubted nephew by Duchess Margaret. Maximilian of Austria also took up his cause, as a happy means of revenging himself on Henry VII. for the treaty of Etaples. There can be small doubt that both the duchess and the German king (Maximilian had succeeded to his father's crown in 1493) were perfectly well aware that they were aiding a manifest fraud. But they made much of Perkin, who followed the imperial court for two years, while his patron was intriguing with English malcontents. The emissaries from Flanders got many promises of assistance, and a formidable rising might have taken place had not Henry VII. been well served by his spies. But in the winter of 1494–95 the traitors were themselves betrayed, and a large number of arrests were made, including not only Lord Fitzwalter and a number of well-known knights of Yorkist families, but Sir William Stanley, the king's chamberlain, who had been rewarded with enormous gifts for his good service at Bosworth, and was reckoned one of the chief supporters of the

throne. Stanley and several others were beheaded, the rest hanged or imprisoned. The vigorous action on the part of the king seems to have cowed all Warbeck's supporters on English soil. But the pretender nevertheless sailed from Flanders in July 1495 with a following of 2,000 exiles and German mercenaries. He attempted to land at Deal, but his vanguard was destroyed by Kentish levies, and he drew off and made for Ireland. Suspecting that this would be his goal, King Henry had been doing his best to strengthen his hold on the Pale, whither he had sent his capable servant Sir Edward Poynings as lord deputy. Already before Warbeck's arrival Poynings had arrested the earl of Kildare, Simnel's old supporter, cowed some of the Irish by military force, and bought over others by promises of subsidies and pensions. But his best-remembered achievement was that he had induced the Irish parliament to pass the ordinances known as "Poynings' Law," by which it acknowledged that it could pass no legislation which had not been approved by the king and his council, and agreed that all statutes passed by the English parliament should be in force in Ireland. That such terms could be imposed shows the strength of Poynings' arm, and his vigour was equally evident when Warbeck came ashore in Munster in July 1495. Few joined the impostor save the earl of Desmond, and he was repulsed from Waterford, and dared not face the army which the lord deputy put into the field against him. Thereupon, abandoning his Irish schemes, Warbeck sailed to Scotland, whose young king James IV. had just been seduced by the emperor Maximilian into declaring war on England. He promised the Scottish king Berwick and 50,000 crowns in return for the aid of an army. James took the offer, gave him the hand of his kinswoman Catherine Gordon, daughter of the earl of Huntly, and took him for a raid into Northumberland (1490). But a pretender backed by Scottish spears did not appeal to the sympathies of the English borderers. The expedition fell flat; not a man joined the banner of the white rose, and James became aware that he had set forth on a fool's errand. But Warbeck soon found other allies of a most unexpected sort. The heavy taxation granted by the English parliament for the Scottish war had provoked discontent and rioting in the south-western counties. In Cornwall especially the disorders grew to such a pitch that local demagogues called out several thousand men to resist the tax-collectors, and finally raised open rebellion, proposing to march on London and compel the king to dismiss his ministers. These spiritual heirs of Jack Cade were Flammock, a lawyer of Bodmin, and a farrier named Michael Joseph. Whether they had any communication with Warbeck it is impossible to say; there is no good proof of such a connection, but their acts served him well. A Cornish army marched straight on London, picking up some supporters in Devon and Somerset on their way, including a discontented baron, Lord Audley, whom they made their captain.

Battle of Blackheath.—So precarious was the hold of Henry VII. on the throne that he was in great danger from this outbreak of mere local turbulence. The rebels swept over five counties unopposed, and were only stopped and beaten in a hard fight on Blackheath, when they had reached the gates of London. Audley, the farrier and the lawyer were all captured and executed (June 18, 1497). But the crisis was not yet at an end. Warbeck, hearing of the rising, but not of its suppression, had left Scotland, and appeared in Devonshire in August. He rallied the wrecks of the west country rebels, and presently appeared before the gates of Exeter with nearly 8,000 men. But the citizens held out against him, and presently the approach of the royal army was reported. The pretender led off his horde to meet the relieving force, but when he reached Taunton he found that his followers were so dispirited that disaster was certain. Thereupon he absconded by night, and took sanctuary in the abbey of Beaulieu. He offered to confess his imposture if he were promised his life, and the king accepted the terms. First at Taunton and again at Westminster, Perkin publicly recited a long narrative of his real parentage, his frauds and his adventures. He was then consigned to not over-strict confinement in the Tower, and might have fared no worse than Lambert Simnel if he had possessed his soul in patience. But in the next year he corrupted his warders, broke out from his prison, and tried to escape beyond seas. He was captured, but the king again spared his life, though he was placed for the future in a dungeon "where he could neither see moon nor sun." Even this did not tame the impostor's mercurial temperament. In 1499 he again planned an escape, which was to be shared by another prisoner, the unfortunate Edward of Clarence, earl of Warwick, whose cell was in the storey above his own. But there were traitors among the Tower officials whom they suborned to help them, and the king was warned of the plot. He allowed it to proceed to the verge of execution, and then arrested both the false and the true Plantagenet. Evidence of a suspicious character was produced to show that they had planned rebellion as well as mere escape, and both were put to death with some of their accomplices. Warbeck deserved all that he reaped, but the unlucky Clarence's fate estranged many hearts from the king. The simple and weakly young man, who had spent 15 of his 25 years in confinement, had, in all probability, done no more than scheme for an escape from his dungeon. But as the true male heir of the house of Plantagenet he was too dangerous to be allowed to survive.

The Tudor Dynasty.—The turbulent portion of the reign of Henry VII. came to an end with Blackheath field and the siege of Exeter. From that time forward the Tudor dynasty was no longer in serious danger; there were still some abortive plots, but none that had any prospect of winning popular support. The chances of Warbeck and Clarence had vanished long before they went to the scaffold. The Yorkist claim, after Clarence's death, might be supposed to have passed to his cousin Edmund, earl of Suffolk, the younger brother of that John, earl of Lincoln, who had been declared heir to the crown by Richard III., and had fallen at Stoke field. Fully conscious of the danger of his position, Suffolk fled to the Continent, and lived for many years as a pensioner of the emperor Maximilian. Apparently he dabbled in treason; it is at any rate certain that in 1501 King Henry executed some, and imprisoned others, of his relatives and retainers. But his plots, such as they were, seem to have been futile. There was no substratum of popular discontent left in England on which a dangerous insurrection might be built up. It was to be 40 years before another outbreak of turbulence against the Crown was to break forth.

The king's great triumphs were the conclusion of the *Intercursus Magnus* of 1496 and the *Intercursus Malus* (so called by the Flemings, not by the English) of 1506. The former provided for a renewal of the old commercial alliance with the house of Burgundy, on the same terms under which it had existed in the time of Edward IV.; the rupture which had taken place during the years when Maximilian was backing Perkin Warbeck had been equally injurious to both parties. The *Intercursus Malus* on the other hand gave England some privileges which she had not before enjoyed—exemption from local tolls in Antwerp and Holland, and a licence for English merchants to sell cloth retail as well as wholesale—a concession which hit the Netherland small traders and middlemen very hard. Another great commercial advantage secured by Henry VII. for his subjects was an increased share of the trade to the Scandinavian countries. The old treaties of Edward IV. with the Hanseatic League had left the Germans still in control of the northern seas. Nearly all the Baltic goods, and most of those from Denmark and Norway, had been reaching London or Hull in foreign bottoms. Henry allied himself with John of Denmark, who was chafing under the monopoly of the Hansa, and obtained the most ample grants of free trade in his realms. The Germans murmured, but the English shipping in eastern and northern waters continued to multiply. Much the same policy was pursued in the Mediterranean. Southern goods hitherto had come to Southampton or Sandwich invariably in Venetian carracks, which took back in return English wool and metals. Henry concluded a treaty with Florence, by which that republic undertook to receive his ships in its harbours and to allow them to purchase all eastern goods that they might require. From this time forward the Venetian monopoly ceased, and the visits of English merchant vessels to the Mediterranean became frequent and regular.

Nor was it in dealing with old lines of trade alone that Henry Tudor showed himself the watchful guardian of the interests of

his subjects. He must take his share of credit for the encouragement of the exploration of the seas of the Far West. The British traders had already pushed far into the Atlantic before Columbus discovered America; fired by the success of the great navigator they continued their adventures, hoping like him to discover a short "north-west passage" to Cathay and Japan. With a charter from the king giving him leave to set up the English banner on all the lands he might discover, the Bristol Genoese trader John Cabot successfully passed the great sea in 1497, and discovered Newfoundland and its rich fishing stations. Henry rewarded him with a pension of £20 a year, and encouraged him to further exploration, in which he discovered all the American coast-line from Labrador to the mouth of the Delaware—a great heritage for England, but one not destined to be taken up for colonization till more than a century had passed.

Foreign Policy of Henry VII.—Henry's services to English commerce were undoubtedly of far more importance to the nation than all the tortuous details of his foreign policy. His chicanery need not, however, be censured over much, for the princes with whom he had to deal, and notably Ferdinand and Maximilian, were as insincere and selfish as himself. Few diplomatic hagglings have been so long and so sordid as that between England and Spain over the marriage treaty which gave the hand of Catherine of Aragon first to Henry's eldest son Arthur, and then, on his premature death in 1502, to his second son Henry. The English king no doubt imagined that he had secured a good bargain, as he had kept the princess's dowry, and yet never gave Ferdinand any practical assistance in war or peace. It is interesting to find that he had for some time at the end of his reign a second Spanish marriage in view; his wife Elizabeth of York having died in 1503, he seriously proposed himself as a suitor for Joanna of Castile, the elder sister of Catherine, and the widow of the archduke Philip, though she was known to be insane. Apparently he hoped thereby to gain vantage ground for an interference in Spanish politics, which would have been most offensive to Ferdinand. Nothing came of the project, which contrasts strangely with the greater part of Henry's sober and cautious schemes.

On the other hand a third project of marriage alliance which Henry carried out in 1503 was destined to be consummated, and to have momentous, though long-deferred, results. This was the giving of the hand of his daughter Margaret to James IV. of Scotland. Thereby he bought quiet on the Border and alliance with Scotland for no more than some ten years. But—as it chanced—the issue of this alliance was destined to unite the English and the Scottish crowns, when the male line of the Tudors died out, and Henry, quite unintentionally, had his share in bringing about the consummation, by peaceful means, of that end which Edward I. had sought for so long to win by the strong hand.

Character of Henry's Internal Rule.—All the foreign politics of the reign of Henry VII. have small importance compared with his work within the realm. The true monument of his ability was that he left England tamed and orderly, with an obedient people and a full exchequer, though he had taken it over wellnigh in a state of anarchy. The mere suppression of insurrections like those of Simnel and Warbeck was a small part of his task. The harder part was to recreate a spirit of order and subordination among a nation accustomed to long civil strife. His instruments were ministers of ability chosen from the clergy and the gentry—he seems to have been equally averse to trusting the baronage at the one end of the social scale, or mere upstarts at the other, and it is notable that no one during his reign can be called a court favourite. The best-known names among his servants were his great chancellor, Archbishop Morton, Foxe, bishop of Winchester, Sir Reginald Bray, and the lawyers Empson and Dudley. These two last bore the brunt of the unpopularity of the financial policy of the king during the latter half of his reign, when the vice of avarice seems to have grown upon him beyond all reason. But Henry was such a hard-working monarch, and so familiar with all the details of administration, that his ministers cannot be said to have had any independent authority, or to have directed their master's course of action.

The machinery employed by the first of the Tudors for the suppression of domestic disorder is well known. The most important item added by him to the administrative machinery of the realm was the famous Star Chamber, which was licensed by the parliament of 1487. It consisted of a small committee of ministers, privy councillors and judges, which sat to deal with offences that seemed to lie outside the scope of the common law, or more frequently with the misdoings of men who were so powerful that the local courts could not be trusted to execute justice upon them, such as great landowners, sheriffs and other royal officials, or turbulent individuals who were the terror of their native districts. The need for a strong central court directly inspired by the king, which could administer justice without respect of persons, was so great, that the constitutional danger of establishing an autocratic judicial committee, untrammelled by the ordinary rules of law, escaped notice at the time. It was not till much later that the nation came to look upon the Star Chamber as the special engine of royal tyranny and to loathe its name. In 1500 it was for the common profit of the realm that there should exist such a court, which could reduce even the most powerful offender to order.

One of the most notable parts of the king's policy was his long-continued and successful assault on the abuse of "livery and maintenance," which had been at its height during the Wars of the Roses. We have seen the part which it had taken in strengthening the influence of those who were already too powerful, and weakening the ordinary operation of the law. Henry put it down with a strong hand, forbidding all liveries entirely, save for the mere domestic retainers of each magnate. His determination to end the system was well shown by the fact that he heavily fined even the earl of Oxford, the companion of his exile, the victor of Bosworth, and the most notoriously loyal peer in the realm, for an ostentatious violation of the statute. Where Oxford was punished, no less favoured person could hope to escape. By the end of the reign the little hosts of badged adherents which had formed the nucleus for the armies of the Wars of the Roses had ceased to exist.

Personal Rule.—Edward IV., as has been already remarked, had many of the opportunities of the autocrat, if only he had cared to use them; but his sloth and self-indulgence stood in the way. Henry VII., the most laborious and systematic of men, turned them to account. He formed his personal opinion on every problem of administration and intervened himself in every detail. In many respects he was his own prime minister, and nothing was done without his knowledge and consent. A consistent policy may be detected in all his acts—that of gathering all the machinery of government into his own hands. Under the later Plantagenets and the Lancastrian kings the great check on the power of the Crown had been that financial difficulties were continually compelling the sovereign to summon parliaments. The estates had interfered perpetually in all the details of governance, by means of the power of the purse. Edward IV., first among English sovereigns, had been able to dispense with parliaments for periods of many years, because he did not need their grants save at long intervals. Henry was in the same position; by strict economy, by the use of foreign subsidies, by the automatic growth of his revenues during a time of peace and returning prosperity, by confiscation and forfeitures, he built himself up a financial position which rendered it unnecessary for him to make frequent appeals to parliament. Not the least fertile of his expedients was that regular exploitation of the law as a source of revenue, which had already been seen in the time of his father-in-law. This part of Henry's policy is connected with the name of his two extortionate "fiscal judges" Empson and Dudley, who "turned law and justice into rapine" by their minute inquisition into all technical breaches of legality, and the nice fashion in which they adapted the fine to the wealth of the misdemeanant, without any reference to his moral guilt or any regard for extenuating circumstances. The king must take the responsibility for their unjust doings; it was his coffers which mainly profited by their chicane. In his later years he fell into the vice of hoarding

money for its own sake; so necessary was it to his policy that he should be free, as far as possible, from the need for applying to parliament for money, that he became morbidly anxious to have great hoards in readiness for any possible day of financial stress. At his death he is said to have had £1,800,000 in hard cash laid by. Hence it is not strange to find that he was able to dispense with parliaments in a fashion that would have seemed incredible to a 14th-century king. In his whole reign he only asked them five times for grants of taxation, and three of the five requests were made during the first seven years of his reign. In the eyes of many men parliament lost the main reason for its existence when it ceased to be the habitual provider of funds for the ordinary expenses of the realm. Those who had a better conception of its proper functions could see that it had at any rate been stripped of its chief power when the king no longer required its subsidies. There are traces of a want of public interest in its proceedings, very different from the anxiety with which they used to be followed in Plantagenet and Lancastrian times. Legislation, which only incidentally affects him, is very much less exciting to the ordinary citizen than taxation, which aims directly at his pocket. It is at any rate clear that during the latter years of his reign, when the time of impostures and rebellions had ended, Henry was able to dispense with parliaments to a great extent, and incurred no unpopularity by doing so. Indeed he was accepted by the English people as the benefactor who had delivered them from anarchy; and if they murmured at his love of hoarding, and cursed his inquisitors Empson and Dudley, they had no wish to change the Tudor rule, and were far from regarding the times of the "Lancastrian experiment" as a lost golden age. The present king might be unscrupulous and avaricious, but he was cautious, intelligent and economical; no one would have wished to recall the régime of that "crowned saint" Henry VI.

Henry VIII.—Nevertheless when the first of the Tudors died, on April 21, 1509, there were few who regretted him. He was not a monarch to rouse enthusiasm, while much was expected from his brilliant, clever and handsome son Henry VIII., whose magnificent presence and manly vigour recalled the early prime of Edward IV. Some years later England realized that its new king had inherited not only the physical beauty and strength of his grandfather, but also every one of his faults, with the sole exception of his tendency to sloth. Henry VIII. indeed may be said, to sum up his character in brief, to have combined his father's brains with his grandfather's passions. Edward IV. was selfish and cruel, but failed to become a tyrant because he lacked the energy for continuous work. Henry VII. was unscrupulous and untiring, but so cautious and wary that he avoided violent action and dangerous risks. Their descendant had neither Edward's sloth nor Henry's moderation; he was capable of going to almost any lengths in pursuit of the gratification of his ambition, his passions, his resentment or his simple love of self-assertion. Yet, however far he might go on the road to tyranny, Henry had sufficient cunning, versatility and power of cool reflection, to know precisely when he had reached the edge of the impossible. He had his father's faculty for gauging public opinion, and estimating dangers, and though his more venturous temperament led him to press on far beyond the point at which the seventh Henry would have halted, he always stopped short on the hither side of the gulf. It was the most marvellous proof of his ability that he died on his throne after nearly 40 years of autocratic rule, during which he had roused more enmities and done more to change the face of the realm than any of the kings that were before him.

But it was long before the nation could estimate all the features of the magnificent but sinister figure which was to dominate England from 1509 to 1547. At his accession Henry VIII. was only 18 years of age, and, if his character was already formed, it was only the attractive side of it that was yet visible. His personal beauty, his keen intelligence, his scholarship, his love of music and the arts, his kingly ambition, were all obvious enough. His selfishness, his cruelty, his ingratitude, his fierce hatred of criticism and opposition, his sensuality, had yet to be discovered by his subjects. A suspicious observer might have detected something ominous in the first act of his reign—the arrest and attainder of his father's unpopular ministers, Empson and Dudley, whose heads he flung to the people in order to win a moment's applause. Whatever their faults, they had served the house of Tudor well, and it was a grotesque perversion of justice to send them to the scaffold on a charge of high treason. A similar piece of cruelty was the execution, some time later, of the earl of Suffolk, who had been languishing long years in the Tower; he was destroyed not for any new plots, but simply for his Yorkish descent. But in Henry's earlier years such acts were still unusual; it was not till he had grown older, and had learnt how much the nation would endure, that judicial murder became part of his established policy.

Henry's first outburst of self-assertion took the form of reversing his father's thrifty and peaceful policy, by plunging into the midst of the Continental wars from which England had been held back by his cautious parent. The adventure was wholly unnecessary, and also unprofitable. But while France was engaged in the "Holy War" against the pope, Venice, the emperor, and Ferdinand of Spain, Henry renewed the old claims of the Plantagenets, and hoped, if not to win back the position of Edward III., at least to recover the duchy of Aquitaine, or some parts of it. He lent an army to Ferdinand for the invasion of Gascony, and landed himself at Calais with 25,000 men, to beat up the northern border of France. Little good came of his efforts. The Spanish king gave no assistance, and the northern campaign, though it included the brilliant battle of the Spurs (Aug. 16, 1513), accomplished nothing more than the capture of Tournai and Thérouanne. It was soon borne in upon King Henry that France, even when engaged with other enemies, was too strong to be overrun in the old style. Moreover, his allies were giving him no aid, though they had eagerly accepted his great subsidies. With a sudden revulsion of feeling Henry offered peace to France, which King Louis XII. gladly bought, agreeing to renew the old pension or tribute that Henry VII. had received by the treaty of Etaples. Their reconciliation and alliance were sealed by the marriage of the French king to Henry's favourite sister Mary, who was the bridegroom's junior by more than 30 years. Their wedlock and the Anglo-French alliance lasted only till the next year, when Louis died, and Mary secretly espoused an old admirer, Charles Brandon, afterwards duke of Suffolk, King Henry's greatest friend and confidant.

While the French war was still in progress there had been heavy fighting on the Scottish border. James IV., reverting to the traditionary policy of his ancestors, had taken the opportunity of attacking England while her king and his army were over-seas. He suffered a disaster which recalls that of David II. at Neville's Cross—a fight which had taken place under precisely similar political conditions. After taking a few Northumbrian castles, James was brought to action at Flodden field by the earl of Surrey (Sept. 9, 1513). After a desperate fight lasting the greater part of a day, the Scots were outmanoeuvred and surrounded. James IV.—who had refused to quit the field—was slain in the forefront of the battle, with the greater part of his nobles; with him fell also some 10,000 or 12,000 of his men. Scotland, with her military power brought low, and an infant king on the throne, was a negligible quantity in international politics for some years. The queen dowager, Margaret Tudor, aided by a party that favoured peace and alliance with England, was strong enough to balance the faction under the duke of Albany which wished for perpetual war and asked for aid from France.

Thomas Wolsey.—With the peace of 1514 ended the first period of King Henry's reign. He was now no longer a boy, but a man of 23, with his character fully developed; he had gradually got rid of his father's old councillors, and had chosen for himself a minister as ambitious and energetic as himself, the celebrated Thomas Wolsey, whom he had just made archbishop of York, and who obtained the rank of cardinal from the pope in the succeeding year. Wolsey was the last of the great clerical ministers of the middle ages, and by no means the worst. Like so many of his predecessors he had risen from the lower middle classes, through the royal road of the church; he had served Henry VII.'s old councillor Foxe, bishop of Winchester, as secre-

tary, and from his household had passed into that of his master. He had been an admirable servant to both, full of zeal, intelligence and energy, and not too much burdened with scruples. The young king found in him an instrument well fitted to his hand, a man fearless, ingenious, and devoted to the furtherance of the power of the Crown, by which alone he had reached his present position of authority. For 14 years he was his master's chief minister—the person responsible in the nation's eyes for all the more unpopular assertions of the royal prerogative, and for all the heavy taxation and despotic acts which Henry's policy required. It mattered little to Henry that the cardinal was arrogant, tactless, and ostentatious; indeed it suited his purpose that Wolsey should be saddled by public opinion with all the blame that ought to have been laid on his own shoulders. It was convenient that the old nobility should detest the upstart, and that the commons should imagine him to be the person responsible for the demands for money required for the royal wars. As long as his minister served his purposes and could execute his behests Henry gave him a free hand, and supported him against all his enemies. It was believed at the time, and is still sometimes maintained by historians, that Wolsey laid down schemes of policy and persuaded his master to adopt them; but the truth would appear to be that Henry was in no wise dominated by the cardinal, but imposed on him his own wishes, merely leaving matters of detail to be settled by his minister. Things indifferent might be trusted to him, but the main lines of English diplomacy and foreign policy show rather the influence of the king's personal desires of the moment than that of a statesman seeking national ends.

It has often been alleged that Henry, under the guidance of Wolsey, followed a consistent scheme for aggrandizing England, by making her the State which kept the balance of power of Europe in her hands. And it is pointed out that during the years of the cardinal's ascendancy the alliance of England was sought in turn by the great princes of the Continent, and proved the make-weight in the scales. This is but a superficial view of the situation. Henry, if much courted, was much deceived by his contemporaries. They borrowed his money and his armies, but fed him with vain promises and illusory treaties. He and his minister were alternately gulled by France and by the emperor, and the net result of all their activity was bankruptcy and discontent at home and ever-frustrated hopes abroad. It is hard to build up a reputation for statecraft for either Henry or Wolsey on the sum total of English political achievement during their collaboration.

Foreign Policy.—During the first few years of the cardinal's ascendancy the elder race of European sovereigns, the kings with whom Henry VII. had been wont to haggle, disappeared one after the other. Louis of France died in 1515, Ferdinand of Aragon in 1516, the emperor Maximilian—the last survivor of his generation—in 1519. Louis was succeeded by the active, warlike and shifty Francis I.; the heritage of both Ferdinand and Maximilian—his maternal and paternal grandfathers—fell to Charles of Habsburg, who already possessed the Netherlands in his father's right and Castile in that of his mother. The enmity of the house of Valois and the house of Habsburg, which had first appeared in the wars of Charles VIII. and Maximilian, took a far more bitter shape under Francis I. and Charles V., two young princes who were rivals from their youth. Their wars were almost perpetual, their peaces never honestly carried out. Their powers were very equally balanced; if Charles owned broader lands than Francis, they were more scattered and in some cases less loyal. The solid and wealthy realm of France proved able to make head against Spain and the Netherlands, even when they were backed by the emperor's German vassals. Charles was also distracted by many stabs in the back from the Ottoman Turks, who were just beginning their attack on Christendom along the line of the Danube. To each of the combatants it seemed that the English alliance would turn the scale in his own favour. Henry was much courted, and wooed with promises of lands to be won from the other side by his ally of the moment. But neither Charles nor Francis wished him to be a real gainer, and he himself was a most untrustworthy friend, for he was quite ready to turn against his ally if he seemed to be growing too powerful, and threatened to dominate all Europe; the complete success of either party would mean that England would sink once more into a second-rate power. How faithless and insincere was Henry's policy may be gauged from the fact that in 1520, after all the pageantry of the "Field of the Cloth of Gold" and his vows of undying friendship for Francis, he met Charles a few weeks later at Gravelines, and concluded with him a treaty which pledged England to a defensive alliance against the king's "good brother" of France. Such things happened not once nor twice during the years of Wolsey's ministry. It was hardly to be wondered at, therefore, if Henry's allies regularly endeavoured to cheat him out of his share of their joint profits. What use was there in rewarding a friend who might become an enemy to-morrow? The greatest deception of all was in 1522, when Charles V., who had made the extraordinary promise that he would get Wolsey made pope, and lend Henry an army to conquer northern France, failed to redeem his word in both respects. He caused his own old tutor, Adrian of Utrecht, to be crowned with the papal tiara, and left the English to invade Picardy entirely unassisted. But this was only one of many such disappointments.

The result of some 12 years of abortive alliances and ill-kept treaties was that Henry had obtained no single one of the advantages which he had coveted, and that he had lavished untold wealth and many English lives upon phantom schemes which crumbled between his fingers. His subjects had already begun to murmur; the early parliaments of his reign had been passive and complaisant; but by 1523 the Commons had been goaded into resistance. They granted only half the subsidies asked from them, pleading that three summers more of such taxation as the cardinal demanded for his master would leave the realm drained of its last penny, and reduced to fall back on primitive forms of barter, "clothes for victuals and bread for cheese," out of mere want of coin. Fortunately for the king his subjects laid all the blame upon his mouthpiece the cardinal, instead of placing it where it was due. On Wolsey's back also was saddled the most iniquitous of Henry's acts of tyranny against individuals—the judicial murder of the duke of Buckingham, the highest head among the English nobility. For some hasty words, amplified by the doubtful evidence of treacherous retainers, together with a foolish charge of dabbling with astrologers, the heir of the royal line of Thomas of Woodstock had been tried and executed with scandalous haste. His only real crime was that, commenting on the lack of male heirs to the crown—for after many years of wedlock with Catherine of Aragon Henry's sole issue was one sickly daughter—he had been foolish enough to remark that if anything should happen to the king he himself was close in succession to the crown. The cardinal bore the blame, because he and Buckingham had notoriously disliked each other; but the deed had really been of the king's own contriving. He was roused to implacable wrath by anyone who dared to speak on the forbidden topic of the succession question.

In the later years of Wolsey's ascendancy, nevertheless, that same question was the subject of many anxious thoughts. From Henry's own mind it was never long absent; he yearned for a male heir, and he was growing tired of his wife Catherine, who was some years older than himself, had few personal attractions, and was growing somewhat of an invalid. Somewhere about the end of 1526 those who were in the king's intimate confidence began to be aware that he was meditating a divorce—a thing not lightly to be taken in hand, for the queen was the aunt of the emperor Charles V., who would be vastly offended at such a proposal. But Henry's doubts had been marvellously stimulated by the fact that he had become enamoured of another lady—the beautiful, ambitious and cunning Anne Boleyn, a niece of the duke of Norfolk, who had no intention of becoming merely the king's mistress, but aspired to be his consort.

England and the Reformation.—The question of the king's divorce soon became inextricably confused with another problem, whose first beginnings go back to a slightly earlier date. What was to be the attitude of England towards the Reformation? It was now nearly ten years since Martin Luther had posted up his famous theses on the church door at Wittenberg, and since

he had testified to his faith before the diet of Worms. All Germany was now convulsed with the first throes of the revolt against the papacy, and the echoes of the new theological disputes were being heard in England. King Henry himself in 1521 had deigned to write an abusive pamphlet against Luther, for which he had been awarded the magnificent title of *Fidei Defensor* by that cultured sceptic Pope Leo X. About the same time we begin to read of orders issued by the bishops for the discovery and burning of all Lutheran books—a clear sign that they were reaching England in appreciable quantities. Hitherto it had been only the works of Wycliffe that had merited this attention on the part of inquisitors. In the Wycliffite remnant, often persecuted but never exterminated, there already existed in England the nucleus of a Protestant party. All through the reign of Henry VII. and the early years of Henry VIII. the intermittent burning of "heretics," and their far more frequent recantations, had borne witness to the fact that the sect still lingered on. The Wycliffites were a feeble folk, compelled to subterraneous ways, and destitute of learned leaders or powerful supporters. But they survived to see Luther's day, and to merge themselves in one body with the first English travelling scholars and merchants who brought back from the Continent the doctrines of the German Reformation. The origins of a Protestant party, who were not mere Wycliffites, but had been first interested in dogmatic controversy by coming upon the works of Luther, can be traced back to the year 1521 and to the University of Cambridge. There a knot of scholars, some of whom were to perish early at the stake, while others were destined to become the leaders of the English Reformation, came together and encouraged each other to test the received doctrines of contemporary orthodoxy by searching the Scriptures and the works of the Fathers. The sect spread in a few years to London, Oxford and other centres of intellectual life, but for many years its followers were not numerous; like the old Lollardy, Protestantism took root only in certain places and among certain classes—notably the lesser clergy and the merchants of the great towns.

King Henry and those who wished to please him professed as great a hatred and contempt for the new purveyors of German doctrines as for the belated disciples of Wycliffe, But there was another movement, whose origins went back for many centuries, which they were far from discouraging, and were prepared to utilize when it suited their convenience. This was the purely political feeling against the tyranny of the papacy, and the abuses of the national church, which in early ages had given supporters to William the Conqueror and Henry II., which had dictated the statutes of Mortmain and of Praemunire. Little had been heard of the old anti-clerical party in England since the time of Henry IV.; it had apparently been identified in the eyes of the orthodox with that Lollardy with which it had for a time allied itself, and had shared in its discredit. But it had always continued to exist, and in the early years of Henry VIII. had been showing unmistakable signs of vitality. The papacy of the Renaissance was a fair mark for criticism. It was not hard to attack the system under which Rodrigo Borgia wore the tiara, while Girolamo Savonarola went to the stake; or in which Julius II. exploited the name of Christianity to serve his territorial policy in Italy, and Leo X. hawked his indulgences round Europe to raise funds which would enable him to gratify his artistic tastes. At no period had the official hierarchy of the Western Church been more out of touch with common righteousness and piety. Moreover, they were sinning under the eyes of a laity which was far more intelligent and educated, more able to think and judge for itself, less the slave of immemorial tradition, than the old public of the middle ages. It Italy the Renaissance might be purely concerned with things intellectual or artistic, and seem to have little or no touch with things moral. Beyond the Alps it was otherwise; among the Teutonic nations at least the revolt against the scholastic philosophy, the rout of the obscurantists, the eager pursuit of Hellenic culture, had a religious aspect. The same generation which refused to take thrice-translated and thrice-garbled screeds from Aristotle as the sum of human knowledge, and went back to the original Greek, was also studying the Old and New Testaments in their original tongues, and drawing from them conclusions as unfavourable to the intelligence as to the scholarship of the orthodox mediaeval divines. Such a discovery as that which showed that the "False Decretals," on which so much of the power of the papacy rested, were mere 9th-century forgeries struck deep at the roots of the whole traditional relation between church and State.

The first English scholars of the Renaissance, like Erasmus on the Continent, did not see the logical outcome of their own discoveries, nor realize that the campaign against obscurantism would develop into a campaign against Roman orthodoxy. Sir Thomas More, the greatest of them, was actually driven into reaction by the violence of Protestant controversialists, and the fear that the new doctrines would rend the church in twain. He became himself a persecutor, and a writer of abusive pamphlets unworthy of the author of the *Utopia*. But to the younger generation the irreconcilability of modern scholarship and mediaeval formulae of faith became more and more evident. One after another all the cardinal doctrines were challenged by writers who were generally acute, and almost invariably vituperative. For the controveries of the Reformation were conducted by both sides, from kings and prelates down to gutter pamphleteers, in language of the most unseemly violence.

But, as has been already said, the scholars and theologians had less influence in the beginning of the English Reformation than the mere lay politicians, whose anti-clerical tendencies chanced to fit in with King Henry's convenience when he quarrelled with the papacy. It is well to note that the first attacks of parliament on the church date back to two years before Luther published his famous theses. The contention began in 1515 with the fierce assault by the Commons on the old abuse of benefit of clergy, and the immunity of clerical criminals from due punishment for secular crimes—a question as old as the times of Henry II. and Becket. But the discussion spread in later years from this particular point into a general criticism of the church and its relations to the State, embracing local grievances as well as the questions which turned on the dealings of the papacy with the Crown. The old complaints which had been raised against the Church of England in the days of Edward I. or Richard II. had lost none of their force in 1526. The higher clergy were more than ever immersed in affairs of State, "Caesarean" as Wycliffe would have called them. It was only necessary to point to the great cardinal himself, and to ask how far his spiritual duties at York were properly discharged while he was acting as the king's prime minister. The cases of Foxe and Morton were much the same; the former passed for a well-meaning man, yet had been practically absent from his diocese for 20 years. Pluralism, nepotism, simony and all the other ancient abuses were more rampant than ever. The monasteries had ceased to be even the nurseries of literature; their chronicles had run dry, and secular priests or laymen had taken up the pens that the monks had dropped. They were wealthier than ever, yet did little to justify their existence; indeed the spirit of the age was so much set against them that they found it hard to keep up the numbers of their inmates. Truculent pamphleteers like Simon Fish, who wrote *Beggars' Supplication*, were already demanding "that these sturdy boobies should be set abroad into the world, to get wives of their own, and earn their living by the sweat of their brows, according to the commandment of God; so might the king be better obeyed, matrimony be better kept, the gospel better preached, and none should rob the poor of his alms." It must be added that monastic scandals were not rare; though the majority of the houses were decently ordered, yet the unexceptionable testimony of archiepiscopal and episcopal visitations shows that in the years just before the Reformation there was a certain number of them where chastity of life and honesty of administration were equally unknown. But above all things the church was being criticized as an *imperium in imperio*, a privileged body not amenable to ordinary jurisdiction, and subservient to a foreign lord—the pope. And it was true that, much as English churchmen might grumble at papal exactions, they were generally ready as a body to support the pope against the Crown; the traditions of the mediaeval church made it impossible for them to do otherwise. That there would in any case have been a new outbreak of anti-clerical and anti-papal agitation in England, under

the influence of the Protestant impulse started by Luther in Germany, is certain. But two special causes gave its particular colour to the opening of the English Reformation; the one was that the king fell out with the papacy on the question of his divorce. The other was that the nation at this moment was chafing bitterly against a clerical minister, whom it (very unjustly) made responsible for the exorbitant taxation which it was enduring, in consequence of the king's useless and unsuccessful foreign wars. The irony of the situation lay in the facts that Henry was, so far as dogmatic views were concerned, a perfectly orthodox prince; he had a considerable knowledge of the old theological literature, as he had shown in his pamphlet against Luther, and though he was ready to repress clerical immunities and privileges that were inconvenient to the Crown, he had no sympathy whatever with the doctrinal side of the new revolt against the system of the mediaeval church. Moreover, Wolsey, whose fall was to synchronize with the commencement of the reforming movement, was if anything more in sympathy with change than was his master. He was an enlightened patron of the new learning, and was inclined to take vigorous measures in hand for the pruning away of the abuses of the church. It is significant that his great college at Oxford—"Cardinal's college" as he designed to call it, "Christ Church" as it is named to-day—was endowed with the revenues of some score of small monasteries which he had suppressed on the ground that they were useless or ill-conducted. His master turned the lesson to account a few years later; but Henry's wholesale destruction of religious houses was carried out not in the interests of learning, but mainly in those of the royal exchequer.

(C. W. C. O.)

VII. THE REFORMATION AND THE AGE OF ELIZABETH (1528–1603)

Wolsey did not fall through any opposition to reform; nor was he opposed to the idea of a divorce. Indeed, both in France and Spain he was credited with the authorship of the project. But he differed from Henry on the question of Catherine's successor. Wolsey desired a French marriage to consummate the breach upon which he was now bent with the emperor; and war, in fact, was precipitated with Spain in 1528. This is said to have been done without Henry's consent; he certainly wished to avoid war with Charles V., and peace was made after six months of passive hostility. Nor did Henry want a French princess; his affections were fixed for the time on Anne Boleyn, and she was the hope of the anti-clerical party. The crisis was brought to a head by the failure of Wolsey's plan to obtain a divorce. Originally it had been suggested that the ecclesiastical courts in England were competent without recourse to Rome. Wolsey deprecated this procedure, and application was made to Clement VII. Wolsey relied upon his French and Italian allies to exert the necessary powers of persuasion; and in 1528 a French army crossed the Alps, marched through Italy and threatened to drive Charles V. out of Naples. Clement was in a position to listen to Henry's prayer; and Campeggio was commissioned with Wolsey to hear the suit and grant the divorce.

No sooner had Campeggio started than the fortunes of war changed. The French were driven out of Naples, and the Imperialists again dominated Rome; the church, wrote Clement to Campeggio, was completely in the power of Charles V. The cardinal, therefore, must on no account pronounce against Charles's aunt; if he could not persuade Henry and Catherine to agree on a mutual separation, he must simply pass the time and come to no conclusion. Hence it was June 1529 before the court got to work at all, and then its proceedings were only preparatory to an adjournment and revocation of the suit to Rome in August. Clement VII. had, in his own words, made up his mind to live and die an imperialist; the last remnants of the French army in Italy had been routed, and the pope had perforce concluded the treaty of Barcelona, a sort of family compact between himself and Charles, whereby he undertook to protect Charles's aunt, and the emperor to support the Medici dynasty in Florence. This peace was amplified at the treaty of Cambrai (Aug. 1529) into a general European pacification in which England had no voice. So far had it fallen since 1521.

In every direction Wolsey had failed, and his failure involved the triumph of the forces which he had opposed. The fate of the papal system in England was bound up with his personal fortunes. It was he and he alone who had kept parliament at arm's length and the enemies of the church at bay. He had interested the king, and to some extent the nation, in a spirited foreign policy, had diverted their attention from domestic questions, and had staved off that parliamentary attack on the church which had been threatened 15 years before. Now he was doomed, and both Campeggio and Cardinal du Bellay were able to send their Governments accurate outlines of the future policy of Henry VIII. The church was to be robbed of its wealth, its power and its privileges, and the papal jurisdiction was to be abolished. In October Wolsey was deprived of the great seal, and surrendered many of his ecclesiastical preferments, though he was allowed to retain his archbishopric of York which he now visited for the first time. The first lay ministry since Edward the Confessor's time came into office; Sir Thomas More became lord chancellor, and Anne Boleyn's father lord privy seal; the only prominent cleric who remained in office was Stephen Gardiner, who succeeded Wolsey as bishop of Winchester.

The Act of Supremacy.—Parliament met in Nov. 1529 and passed many Acts against clerical exactions, mortuaries, probate dues and pluralities, which evoked a passionate protest from Bishop Fisher: "Now, with the Commons," he cried in the House of Lords, "is nothing but 'Down with the church.'" During 1530 Henry's agents were busy abroad making that appeal on the divorce to the universities which Cranmer had suggested. In 1531 the clergy in convocation, terrified by the charge of *praemunire* brought against them for recognizing Wolsey's legatine authority, paid Henry £118,000 and recognized him as supreme head of the church so far as the law of Christ would allow. The details of this surrender were worked out by king and Commons in 1532; but Gardiner and More secured the rejection of the Lords of the bill in which they were embodied, and it was not till 1533, when More had ceased to be chancellor and Gardiner to be secretary, that a parliamentary statute annihilated the independent legislative authority of the church. An Act was, however, passed in 1532 empowering the king, if he thought fit, to stop the payment of annates to Rome. Henry suspended his consent in order to induce the pope to grant Cranmer his bulls as archbishop of Canterbury where he succeeded Warham late in 1532. The stratagem was successful, and Henry cast off all disguise. The Act of annates was confirmed; another prohibiting appeals to Rome and providing for the appointment of bishops without recourse to the papacy was passed; and Cranmer declared Henry's marriage with Catherine null and void and that with Anne Boleyn, which had taken place about Jan. 25, 1533, valid. Anne was crowned in June, and on Sept. 7 the future Queen Elizabeth was born. At length in 1534 Clement VII. concluded the case at Rome, pronouncing in favour of Catherine's marriage, and drawing up a bull of excommunication against Henry and his abettors. But he did not venture to publish it; public opinion in England, while hostile to the divorce, was not in favour of the clergy or the pope, and the rivalry between Charles V. and Francis I. was too bitter to permit of joint, or even isolated, action against Henry. Charles was only too anxious to avoid the duty of carrying out the pope's commands, and a year later he was once more involved in war with France. Henry was able to deal roughly with such manifestations as Elizabeth Barton's visions, and in the autumn of 1534 to obtain from parliament the Act of Supremacy which transferred to him the juridical, though not the spiritual, powers of the pope. No penalties were attached to this Act, but another passed in the same session made it treason to attempt to deprive the king of any of his titles, of which supreme head of the church was one, being incorporated in the royal style by letters patent of Jan. 1535. Fisher and More were executed on this charge; they had been imprisoned in the previous year for objecting to take the form of oath to the succession as vested in Anne Boleyn's children which the commissioners prescribed. But their lives could only be forfeit on the supposition

that they sought to deprive the king of his royal supremacy. Many of the friars observant of Greenwich and monks of the Charterhouse were involved in a similar fate, but there was no general resistance, and Henry, now inspired or helped by Thomas Cromwell, was able to proceed with the next step in the Reformation, the dissolution of the monasteries.

Dissolution of the Monasteries.—It was Cecil's opinion 25 years later that, but for the dissolution, the cause of the Reformation could not have succeeded. Such a reason could hardly be avowed, and justification had to be sought in the condition of the monasteries themselves. The action of Wolsey and other bishops before 1529, the report of a commission of cardinals appointed by Paul III. in 1535, the subsequent experience of other, even Catholic, countries give collateral support to the conclusions of the visitors appointed by Cromwell, although they were dictated by a desire not to deal out impartial justice, but to find reasons for a policy already adopted in principle. That they exaggerated the evils of monastic life hardly admits of doubt; but even a Henry VIII. and a Thomas Cromwell would not have dared to attack, or succeeded in destroying, the monasteries had they retained their original purity and influence. As it was their doubtful reputation and financial embarrassments enabled Henry to offer them as a gigantic bribe to the upper classes of the laity, and the Reformation parliament met for its last session early in 1536 to give effect to the reports of the visitors and to the king's and their own desires.

But it had barely been dissolved in April when it became necessary to call another. In January the death of Catherine had rejoiced the hearts of Henry and Anne Boleyn, but Anne's happiness was short-lived. Two miscarriages and the failure to produce the requisite male heir linked her in Henry's mind and in misfortune to Catherine; unlike Catherine she was unpopular and not above suspicion. The story of her tragedy is still one of the most horrible and mysterious pages in English history. It is certain that Henry was tired and wanted to get rid of her; but if she were innocent, why were charges brought against her which were not brought against Catherine of Aragon and Anne of Cleves? and why were four other victims sacrificed when one would have been enough? The peers a year before could acquit Lord Dacre; would they have condemned the queen without some show of evidence? and unless there was suspicious evidence, her daughter was inhuman in making no effort subsequently to clear her mother's character. However that may be, Anne was not only condemned and executed, but her marriage was declared invalid and her daughter a bastard. Parliament was required to establish the succession on the new basis of Henry's new queen, Jane Seymour. It also empowered the king to leave the crown by will if he had no legitimate issue; but the illegitimate son, the duke of Richmond, in whose favour this provision is said to have been conceived, died shortly afterwards.

Fortunately for Henry, Queen Jane roused no domestic or foreign animosities; Charles V. and Francis I. were at war; and the pope's and Pole's attempt to profit by the Pilgrimage of Grace came too late to produce any effect except the ruin of Pole's family. The two risings of 1536 in Lincolnshire and Yorkshire were provoked partly by the dissolution of the monasteries, partly by the collection of a subsidy and fears of fresh taxation on births, marriages and burials, and partly by the protestantizing Ten Articles of 1536 and Cromwell's *Injunctions*. They were conservative demonstrations in favour of a restoration of the old order by means of a change of ministry, but not a change of dynasty. The Lincolnshire rising was over before the middle of October; the more serious revolt in Yorkshire under Aske lasted through the winter. Henry's lieutenants were compelled to temporize and make concessions. Aske was invited to come to London and hoodwinked by Henry into believing that the king was really bent on restoration and reform. But an impatient outburst of the insurgents and a foolish attempt to seize Hull and Scarborough gave Henry an excuse for repudiating the concessions made in his name. He could afford to do so because England south of the Trent remained stauncher to him than England north of it did to the Pilgrimage. Aske and other leaders were tried and executed, and summary vengeance was wreaked on the northern counties, especially on the monasteries. The one satisfactory outcome was the establishment of the Council of the North, which gave the shires between the Border and the Trent a stronger and more efficient government than they had ever had before.

The "Six Articles."—Probably the Pilgrimage had some effect in moderating Henry's progress. The monasteries did not benefit and in 1538–39 the greater were involved in the fate which had already overtaken the less. But no further advances were made towards Protestantism after the publication and authorization of the "Great" Bible in English. The Lutheran divines who came to England in 1538 with a project for a theological union were rebuffed; the parliament elected in 1539 was Catholic, and only the reforming bishops in the House of Lords offered any resistance to the Six Articles which reaffirmed the chief points in Catholic doctrine and practice. The alliance between pope, emperor and French king induced Henry to acquiesce in Cromwell's scheme for a political understanding with Cleves and the Schmalkaldic League, which might threaten Charles V.'s position in Germany and the Netherlands, but could not be of much direct advantage to England. Cromwell rashly sought to wed Henry to this policy, proposed Anne of Cleves as a bride for Henry, now once more a widower, and represented the marriage as England's sole protection against a Catholic league. Henry put his neck under the yoke, but soon discovered that there was no necessity; for Charles and Francis were already beginning to quarrel and had no thought of a joint attack on England. The discovery was fatal to Cromwell; after a severe struggle in the council he was abandoned to his enemies, attainted of treason and executed. Anne's marriage was declared null, and Henry found a fifth queen in Catherine Howard, a niece of Norfolk, a protégée of Gardiner, and a friend of the Catholic church.

Nevertheless there was no reversal of what had been done, only a check to the rate of progress. Cranmer remained archbishop and compiled an English Litany, while Catherine Howard soon ceased to be queen; charges of loose conduct, which in her case at any rate were not instigated by the king, were made against her and she was brought to the block; she was succeeded by Catherine Parr, a mild patron of the new learning. The Six Articles were only fitfully put in execution, especially in 1543 and 1546; all the plots against Cranmer failed; and before he died Henry was even considering the advisability of further steps in the religious reformation, apart from mere spoliation like the confiscation of the chantry lands.

But Scotland, Ireland and foreign affairs concerned him most. Something substantial was achieved in Ireland; the papal sovereignty was abolished and Henry received from the Irish parliament the title of king instead of lord of Ireland. The process was begun of converting Irish chieftains into English peers which eventually divorced the Irish people from their natural leaders; and principles of English law and government were spread beyond the Pale. In Scotland Henry was less fortunate. He failed to win over James V. to his anti-papal policy, revived the feudal claim to suzerainty, won the battle of Solway Moss (1542), and then after James's death bribed and threatened the Scots estates into concluding a treaty of marriage between their infant queen and Henry's son. The church in Scotland led by Beaton, and the French party led by James V.'s widow, Mary of Guise, soon reversed this decision, and Hertford's heavy hand was (1544) laid on Edinburgh in revenge. France was at the root of the evil, and Henry was thus induced once more to join Charles V. in war (1543). The joint invasion of 1544 led to the capture of Boulogne, but the emperor made peace in order to deal with the Lutherans and left Henry at war with France. The French attempted to retaliate in 1545, and burnt some villages in the Isle of Wight and on the coast of Sussex. But their expedition was a failure, and peace was made in 1546, by which Henry undertook to restore Boulogne in eight years' time on payment of 800,000 crowns. Scotland was not included in the pacification, and when Henry died (Jan. 28, 1547) he was busy preparing to renew his attempt on Scotland's independence.

Edward VI.—He left a council of 16 to rule during his son's

minority. The balance of parties which had existed since Cromwell's fall had been destroyed in the last months of the reign by the attainder of Norfolk and his son Surrey, and the exclusion of Gardiner and Thirlby from the council of regency. Men of the new learning prevailed, and Hertford (later duke of Somerset), as uncle to Edward VI., was made protector of the realm and governor of the king's person. He soon succeeded in removing the trammels imposed upon his authority, and made himself king in everything but name. He used his arbitrary power to modify the despotic system of the Tudors; all treason laws since Edward III., all heresy laws, all restrictions upon the publication of the Scriptures were removed in the first parliament of the reign, and various securities for liberty were enacted. The administration of the sacrament of the altar in both elements was permitted, the Catholic interpretation of the mass was rendered optional, images were removed, and English was introduced into nearly the whole church service. In the following session (1548–49) the first Act of Uniformity authorized the first Book of Common Prayer. It met with strenuous resistance in Devon and in Cornwall, where rebellions added to the thickening troubles of the protector.

His administration was singularly unsuccessful. In 1547 he won the great but barren victory of Pinkie Cleugh over the Scots, and attempted to push on the marriage and union by a mixture of conciliation and coercion. He made genuine and considerable concessions to Scottish feeling, guaranteeing autonomy and freedom of trade, and suggesting that the two realms should adopt the indifferent style of the empire of Great Britain. But he also seized Haddington in 1548, held by force the greater part of the Lowlands, and, when Mary was transported to France, revived the old feudal claims which he had dropped in 1547. France was, as ever, the backbone of the Scots resistance; men and money poured into Edinburgh to assist Mary of Guise and the French faction. The protector's offer to restore Boulogne could not purchase French acquiescence in the union of England and Scotland; and the bickerings on the borders in France and open fighting in Scotland led the French to declare war on England in Aug. 1549. They were encouraged by dissensions in England. Somerset's own brother, Thomas Seymour, jealous of the protector, intrigued against the Government; he sought to secure the hand of Elizabeth, the favour of Edward VI. and the support of the Suffolk line, secretly married Catherine Parr, and abused his office as lord high admiral to make friends with pirates and other enemies of order. Foes of the family, such as Warwick and Southampton, saw in his factious conduct the means of ruining both the brothers. Seymour was brought to the block, and the weak consent of the protector seriously damaged him in the public eye. His notorious sympathy with the peasantry further alienated the official classes and landed gentry, and his campaign against enclosures brought him into conflict with the strongest forces of the time. The remedial measures which he favoured failed; and the rising of Ket in Norfolk and others less important in nearly all the counties of England, made Somerset's position impossible. Bedford and Herbert suppressed the rebellion in the west, Warwick that in Norfolk (July–Aug. 1549). They then combined with the majority of the council and the discontented Catholics to remove the protector from office and imprison him in the Tower (October).

Establishment of Protestantism.—The Catholics hoped for reaction, the restoration of the mass, and the release of Gardiner and Bonner, who had been imprisoned for resistance to the protector's ecclesiastical policy. But Warwick meant to rely on the Protestant extremists; by Jan. 1550 the Catholics had been expelled from the council, and the pace of the Reformation increased instead of diminishing. Peace was made with France by the surrender of Boulogne and abandonment of the policy of union with Scotland (March 1550); and the approach of war between France and the emperor, coupled with the rising of the princes in Germany, relieved Warwick from foreign apprehensions and gave him a free hand at home. Gardiner, Bonner, Heath, Day and Tunstall were one by one deprived of their sees; a new ordinal simplified the ritual of ordination, and a second Act of Uniformity and Book of Common Prayer (1552) repudiated the Catholic interpretation which had been placed on the first and imposed a stricter conformity to the Protestant faith. All impediments to clerical marriage were removed, altars and organs were taken down, old service books destroyed and painted windows broken; it was even proposed to explain away the kneeling at the sacrament. The liberal measures of the protector were repealed, and new treasons were enacted; Somerset himself, who had been released and restored to the council in 1550, became an obstacle in Warwick's path, and was removed by means of a bogus plot, being executed in Jan. 1552; while Warwick had himself made duke of Northumberland, his friend Dorset duke of Suffolk, and Herbert earl of Pembroke.

But his ambition and violence made him deeply unpopular, and the failing health of Edward VI. opened up a serious prospect for Northumberland. He was only safe so long as he controlled the government, and prevented the administration of justice, and the knowledge that not only power but life was at stake drove him into a desperate plot for the retention of both. He could trade upon Edward's precocious hatred of Mary's religion, he could rely upon French fears of her Spanish inclinations, and the success which had attended his schemes in England deluded him into a belief that he could supplant the Tudor with a Dudley dynasty. His son Guilford Dudley was hastily married to Lady Jane Grey, the eldest granddaughter of Henry VIII.'s younger sister Mary. Henry's two daughters, Mary and Elizabeth, the descendants of his elder sister Margaret, and Lady Jane's mother, the duchess of Suffolk, were all to be passed over, and the succession was to be vested in Lady Jane and her heirs male. Edward was persuaded that he could devise the crown by will, the council and the judges were browbeaten into acquiescence, and three days after Edward's death (July 6, 1553), Lady Jane Grey was proclaimed queen in London. Northumberland had miscalculated the temper of the nation, and failed to kidnap Mary. She gathered her forces in Norfolk and Suffolk, Northumberland rode out from London to oppose her, but defection dogged his steps, and even in London Mary was proclaimed queen behind his back by his fellow-conspirators. Mary entered London amid unparalleled popular rejoicings, and Northumberland was sent to the scaffold.

Queen Mary.—Mary was determined from the first to restore papalism as well as Catholicism, but she had to go slowly. The papacy had few friends in England, and even Charles V., on whom Mary chiefly relied for guidance, was not eager to see the papal jurisdiction restored. He wanted England to be first firmly tied to the Habsburg interests by Mary's marriage with Philip. Nor was it generally anticipated that Mary would do more than restore religion as it had been left by her father. She did not attempt anything further in 1553 than the repeal of Edward VI.'s legislation and the accomplishment of the Spanish marriage. The latter project provoked fierce resistance; various risings were planned for the opening months of 1554, and Wyat's nearly proved successful. Only his arrogance and procrastination and Mary's own courage saved her throne. But the failure of this protest enabled Mary to carry through the Spanish marriage, which was consummated in July; and in the ensuing parliament (Oct.–Jan. 1554–55) all anti-papal legislation was repealed; Pole was received as legate; the realm was reconciled to Rome; and, although the holders of abbey lands were carefully protected against attempts at restitution, the church was empowered to work its will with regard to heresy. The Lollard statutes were revived, and between Feb. 1555 and Nov. 1558 some 300 Protestants were burnt at the stake. They began with John Rogers and Rowland Taylor, and Bishops Ferrar of St. Davids and Hooper of Gloucester. Ridley and Latimer were not burnt until Oct. 1555, and Cranmer not till March 1556. London, Essex, Hertfordshire, East Anglia, Kent and Sussex provided nearly all the victims; only one was burnt north of the Trent, and only one south-west of Wiltshire. But in the Protestant districts neither age nor sex was spared; even the dead were dug up and burnt. The result was to turn the hearts of Mary's people from herself, her church and her creed. Other causes helped to convert their enthusiastic loyalty into bitter hatred. The Spanish marriage was a failure from every point of view. In spite of Mary's repeated delusions,

she bore no child, and both parliament and people resisted every attempt to deprive Elizabeth of her right to the succession. Philip did all he could to conciliate English affections, but they would not have Spanish control at any price. They knew that his blandishments were dictated by ulterior designs, and that the absorption of England in the Habsburg empire was his ultimate aim. As it was, the Spanish connection checked England's aspirations; her adventurers were warned off the Spanish Main, and even trade with the colonies of Philip's ally Portugal was prohibited. They had to content themselves with the Arctic ocean and Muscovy; and they soon found themselves at war in Philip's interests. Philip himself refused to declare war on Scotland on England's behalf, but he induced Mary to declare war on France on his own (1557). The glory of the war fell to the Spaniards at St. Quentin (1557) and Gravelines (1558), but the shame to England by the loss of Calais (Jan. 1558). Ten months later Mary died (Nov. 17), deserted by her husband and broken-hearted at the loss of Calais and her failure to win English hearts back to Rome.

Elizabeth.—The Spanish and Venetian ambassadors in London were shocked at what they regarded as the indecent rejoicings over Elizabeth's accession. The nation, indeed, breathed a new life. Papal control of its ecclesiastical, and Spanish control of its foreign policy ceased, and it had a queen who gloried in being "mere English." There was really no possible rival sovereign, and no possible alternative policy. The English were tugging at the chain and Elizabeth had to follow; her efforts throughout were aimed at checking the pace at which her people wanted to go. She could not have married Philip had she wished to, and she could not have kept her sea-dogs off the Spanish Main. They were willing to take all the risks and relieve her of all responsibility; they filled her coffers with Spanish gold which they plundered as pirates, knowing that they might be hanged if caught; and they fought Elizabeth's enemies in France and in the Netherlands as irregulars, taking their chance of being shot if taken prisoners. While Elizabeth nursed prosperity in peace, her subjects sapped the strength of England's rivals by attacks which were none the less damaging because they escaped the name of war.

It required all Elizabeth's finesse to run with the hare and hunt with the hounds; but she was, as Henry III. of France said, *la plus fine femme du monde,* and she was ably seconded by Cecil who had already proved himself an adept in the art of taking cover. Nevertheless, English policy in their hands was essentially aggressive. It could not be otherwise if England was to emerge from the slough in which Mary had left it. The first step was to assert the principle of England for the English; the queen would have no foreign husband, though she found suitors useful as well as attractive. Spanish counsels were applauded and neglected, and the Spaniards soon departed. Elizabeth was glad of Philip's support at the negotiations for peace at Cateau Cambrésis (1559), but she took care to assert the independence of her diplomacy and of England's interests. At home the church was made once more English. All foreign jurisdiction was repudiated, and under the style "supreme governor" Elizabeth reclaimed nearly all the power which Henry VIII. had exercised as "supreme head." The Act of Uniformity (1559) restored with a few modifications the second prayer-book of Edward VI. The bishops almost unanimously refused to conform, and a clean sweep was made of the episcopal bench. An eminently safe and scholarly archbishop was found in Matthew Parker, who had not made himself notorious by resistance to authority even under Mary. The lower clergy were more amenable; the 200 who alone are said to have been ejected should perhaps be multiplied by five; but even so they were not one in seven, and these seven were clergy who had been promoted in Mary's reign, or who had stood the celibate and other tests of 1553–54. Into the balance must be thrown the hundreds, if not thousands, of zealots who had fled abroad and returned in 1558–59. The net result was that a few years later the lower house of convocation only rejected by one vote a very puritanical petition against vestments and other "popish dregs."

The next step was to expand the principle of England for the English into that of Britain for the British, and Knox's reformation in 1559–60 provided an opportunity for its application. By timely and daring intervention in Scotland Elizabeth procured the expulsion of the French bag and baggage from North Britain, and that French avenue to England was closed for ever. The logic of this plan was not applied to Ireland; there it was to be Ireland for the English for many a generation yet to come; and so Ireland remained Achilles' heel, the vulnerable part of the United Kingdom. The Protestant religion was forced upon the Irish in a foreign tongue and garb and at the point of foreign pikes; and national sentiment supported the ancient faith and the ancient habits in resistance to the Saxon innovations. In other directions the expansion of England, the third stage in the development of Elizabeth's policy, was more successful. The attractions of the Spanish Main converted the seafaring folk of south-west England into hardy Protestants, who could on conscientious as well as other grounds contest a papal allocation of new worlds to Spain and Portugal. Their monopoly was broken up by Hawkins, Drake, Frobisher, Raleigh, and scores of others who recognized no peace beyond the line; and although, as far as actual colonies went, the results of Elizabeth's reign were singularly meagre, the idea had taken root and the ground had been prepared. In every direction English influence penetrated, and Englishmen before 1603 might be found in every quarter of the globe, following Drake's lead into the Pacific, painfully breaking the ice in search of a north-east or a north-west passage, hunting for slaves in the wilds of Africa, journeying in caravans across the steppes of Russia into central Asia, bargaining with the Turks on the shores of the Golden Horn, or with the Greeks in the Levant, laying the foundations of the East India company, or of the colonies of Virginia and Newfoundland.

Mary, Queen of Scots.—This expansion was mainly at the expense of Spain; but at first Spain was regarded as Elizabeth's friend, not France. France had a rival candidate for Elizabeth's throne in Mary Stuart, the wife of the dauphin who soon (1559) became king as Francis II.; and Spanish favour was sought to neutralize this threat. Fortunately for Elizabeth, Francis died in 1560, and the French Government passed into the hands of Catherine de' Medici, who had no cause to love her daughter-in-law and the Guises. France, too, was soon paralysed by the wars of religion which Elizabeth judiciously fomented with anything but religious motives. Mary Stuart returned to Scotland with nothing but her brains and her charms on which to rely in her struggle with her people and her rival. She was well equipped in both respects, but human passions spoilt her chance; her heart turned her head. Elizabeth's head was stronger and she had no heart at all. When Mary married Darnley she had the ball at her feet; the pair had the best claims to the English succession and enjoyed the united affections of the Catholics. But they soon ceased to love one another, and could not control their jealousies. There followed rapidly the murders of Rizzio and Darnley, the Bothwell marriage, Mary's defeat, captivity, and flight into England (1568). It was a difficult problem for Elizabeth to solve; to let Mary go to France was presenting a good deal more than a pawn to her enemies; to restore her by force to her Scottish throne might have been heroic, but it certainly was not politics; to hand her over to her Scottish foes was too mean even for Elizabeth; and to keep her in England was to nurse a spark in a powder-magazine. Mary was detained in the hope that the spark might be carefully isolated.

But there was too much inflammable material about. The duke of Norfolk was a Protestant, but his convictions were weaker than his ambition, and he fell a victim to Mary's unseen charms. The Catholic north of England was to rise under the earls of Westmorland and Northumberland, who objected to Elizabeth's seizure of their mines and jurisdictions as well as to her proscription of their faith; and the pope was to assist with a bull of deposition. Norfolk, however, played the coward; the bull came nearly a year too late, and the rebellion of the earls (1569) was easily crushed. But the conspiracies did not end, and Spain began to take a hand. Elizabeth, partly in revenge for the treatment of Hawkins and Drake at San Juan de Ulloa, seized some Spanish treasure on its way to the Netherlands (Dec. 1569). Alva's opera-

tions were fatally handicapped by this disaster, but Philip was too much involved in the Netherlands to declare war on England. But his friendship for Elizabeth had received a shock, and henceforth his finger may be traced in most of the plots against her, of which the Ridolfi conspiracy was the first. It cost Norfolk his head and Mary more of her scanty liberty. Elizabeth also began to look to France, and in 1572, by the treaty of Blois, France instead of Spain became England's ally, while Philip constituted himself as Mary's patron. The massacre of St. Bartholomew placed a severe strain upon the new alliance, but was not fatal to it. A series of prolonged but hollow marriage negotiations between Elizabeth and first Anjou (afterwards Henry III.) and then Alençon (afterwards duke of Anjou) served to keep up appearances. But the friendship was never warm; Elizabeth's relations with the Huguenots on the one hand and her fear of French designs on the Netherlands on the other prevented much cordiality. But the alliance stood in the way of a Franco-Spanish agreement, limited Elizabeth's sympathy with the French Protestants, and enabled her to give more countenance than she otherwise might have done to the Dutch.

War with Spain.—Gradually Philip grew more hostile under provocation; slowly he came to the conclusion that he could never subdue the Dutch or check English attacks on the Spanish Main without a conquest of England. Simultaneously the counter-Reformation began its attacks; the "Jesuit invasion" took place in 1580, and Campion went to the block. A papal and Spanish attempt upon Ireland in the same year was foiled at Smerwick. But more important was Philip's acquisition of the throne of Portugal with its harbours, its colonies and its marine. This for the first time gave him a real command of the sea, and at least doubled the chances of a successful attack upon England. But Philip's mind moved slowly and only on provocation. It took a year or two to satisfy him that Portugal was really his; not until 1583 was the fleet of the pretender Don Antonio destroyed in the Azores. The victor, Santa Cruz, then suggested an armada against England, but the English Catholics could not be brought into line with a Spanish invasion. The various attempts to square James VI. of Scotland had not been successful, and events in the Netherlands and in France disturbed Philip's calculations. But his purpose was now probably fixed. After the murder of William the Silent (1584) Elizabeth sided more openly with the Dutch; the Spanish ambassador Mendoza was expelled from England for his intrigues with Elizabeth's enemies (1586); and on the discovery of Babington's plot Elizabeth yielded to the demand of her parliament and her ministers for Mary's execution (1587); her death removed the only possible centre for a Catholic rebellion in case of a Spanish attack. It also removed Philip's last doubts; Mary had left him her claims to the English throne, and he might, now that she was out of his path, hope to treat England like Portugal. Drake's "singeing of Philip's beard" in Cadiz harbour in 1587 delayed the expedition for a year, and a storm again postponed it in the early summer of 1588. At length the armada sailed in July under the incompetent duke of Medina Sidonia; its object was to secure command of the narrow seas and facilitate the transport of Parma's army from the Netherlands to England. But Philip after his 20 years' experience in the Netherlands can hardly have hoped to conquer a bigger and richer country with scantier means and forces. He relied in fact upon a domestic explosion, and the armada was only to be the torch. The miscalculation made it a hopeless enterprise from the first. Scarcely an English Catholic would have raised a finger in Philip's favour; and when he could not subdue the two provinces of Holland and Zealand, it is absurd to suppose that he could have simultaneously subdued them and England as well. English armies were not perhaps very efficient, but they were as good as the material with which William of Orange began his task. Philip, however, was never given the opportunity. His armada was severely handled in a week's fighting on its way up the Channel, and was driven off the English ports into the North Sea; there a south-west gale drove it far from its rendezvous, and completed the havoc which the English ships had begun. A miserable remnant alone escaped destruction in its perilous flight round the north and west of Scotland.

The defeat of the armada was the beginning and not the end of the war; and there were moments between 1588 and 1603 when England was more seriously alarmed than in 1588. The Spaniards seized Calais in 1596; at another time they threatened England from Brest, and the "invisible" armada of 1599 created a greater panic than the "invincible" armada of 1588. It was not till the very end of the reign that what was in some ways the most dangerous of Spanish aggressions was foiled at Kinsale. Nor were the English counter-attacks very happy; the attempt on Portugal in 1589 under Drake and Norris proved a complete failure. The raid on Cadiz under Essex and Raleigh in 1596 was attended with better results, but the "Islands" voyage to the Azores in 1597 was a very partial success. Still it was now a war upon more or less equal terms, and there was little more likelihood that it would end with England's than with Spain's loss of national independence. The subjection of the Netherlands was now almost out of the question, and although Elizabeth's help had not enabled the Protestant cause to win in France, Henry IV. built up a national monarchy which would be quite as effectual a bar to the ambitions of Spain.

Elizabeth had in fact safely piloted England through the struggle to assert its national independence in religion and politics and its claim to a share in the new inheritance which had been opened up for the nations of Europe; and the passionate loyalty which had supported her as the embodiment of England's aspirations somewhat cooled in her declining years. She herself grew more cautious and conservative than ever, and was regarded as an obstacle by the hotheads in war and religion. She sided with the "scribes," Burghley and Sir Robert Cecil, against the men of war, Essex and Raleigh; and she abetted Whitgift's rigorous persecution of the Puritans whose discontent with her *via media* was rancorously expressed in the Martin Marprelate tracts. Essex's folly and failure to crush Hugh O'Neill's rebellion (1599), the most serious effort made in the reign to throw off the English yoke in Ireland, involved him in treason and brought him to the block. Parliament was beginning to quarrel with the royal prerogative, particularly when expressed in the grant of monopolies, and even Mountjoy's success in Ireland (1602–03) failed to revive popular enthusiasm for the dying queen. Strange as it may seem, the accession of James I. (March 24, 1603) was hailed by Shakespeare, and minor writers, as heralding a new and gladder age.

(A. F. Po.)

VIII. THE STUARTS, 1603–1714

James I., 1603–1625.—The first Stuart king ascended the throne of England under favourable auspices. In the war with Spain the English nation had asserted its political and religious independence and had laid the foundation of its naval supremacy. Trade was expanding and wealth increasing. By the union of the Crowns an old enemy of England became her partner and a fully insular kingdom was established. The Elizabethan conquest of Ireland made the new king effective master of that country.

James was in his 37th year, a mature and experienced man. He had maintained correspondence with ministers and courtiers of Elizabeth, so that her death found him prepared. For the most part he kept the old servants of the Crown in their places, giving his chief confidence to Sir Robert Cecil, the secretary, whom he successively created Viscount Cranborne and earl of Salisbury. James encountered no serious opposition. A lover of peace, he negotiated a treaty with Spain in 1604. At home ecclesiastical affairs claimed his first attention. Both of the parties which had suffered under Elizabeth looked to him for relief; the Catholics expected much from the son of Mary Stuart; the Puritans expected much from a king of Scots bred in Calvinist orthodoxy. James began by remitting the recusancy fines, but soon found that he could not dispense with that source of revenue. His return to the policy of intolerance revived Catholic discontent, which broke out in the Gunpowder Plot of 1605. In Scotland he had often been incensed by the ministers of the Kirk, who claimed ecclesiastical independence together with the right of admonishing sovereigns. On his journey southwards he received ungraciously the so-called Millenary Petition, in which a thousand ministers,

it was said, asked for certain changes in rites and ceremonies. In a conference at Hampton Court between divines of opposite schools, where the king presided, he declared his abhorrence of Presbytery and refused all concessions save a new and more accurate translation of the Scriptures, fulfilled in the Authorized Version.

James and Parliament.—The king met his first parliament in March 1604. With the advance of prosperity and enlightenment, the classes represented in the House of Commons—the squires and yeomen, the citizens and lawyers—became more self-confident and more desirous of power. But James held in its extreme form the doctrine of Divine right then generally accepted. As the king, and the king alone, derives his power direct from God, he can in the last resort overrule every other authority; parliament holds its privileges merely by his free grace. Against this doctrine the Commons maintained that they held their privileges, like their lands and goods, not of grace but of right, thus implying that the royal prerogative could be limited by law. Contrary to the king's wishes, the Commons pressed for the strict execution of the laws against Catholics and for indulgence to Puritans. James wished the personal union of England and Scotland to be followed by an incorporating union, but the Commons, who disliked the Scots and feared their competition in trade, would only consent to a mutual repeal of hostile laws. The Commons wanted the king to forgo his right of purveyance and his rights of wardship and marriage over minors who were tenants of the Crown in return for a fixed revenue somewhat larger than the product of these rights. The proposed bargain, known as the Great Contract, was repeatedly discussed, but came to nought because James demanded a larger equivalent than the Commons would grant. The Commons were penurious and James, a bad economist, sank into debt. The Commons took alarm at the decision in Bates' case by the court of exchequer in 1606, which laid down, not merely that the king could levy customs duties at his pleasure (impositions, so-called), but also that he had a power of taking measures for the public safety unlimited by law (*see* BATES, JOHN).

James dissolved his first parliament in 1611. Salisbury, whom he made treasurer in 1608 and who did something to relieve his distress, died in 1612. The heir to the crown, Prince Henry, died in the same year. A new parliament in 1614 proved unmanageable, made no grant, enacted no law and was dissolved after a session of two months. James struggled on for seven years without a parliament. Always under the influence of favourites chosen for their youth and good looks, he was fascinated at this time by a certain George Villiers, whom he made successively earl, marquess and duke of Buckingham. In 1615 and the following years a London merchant, Lionel Cranfield, who had been brought into the king's service, effected such reforms and economies that revenue at last balanced expenditure. But then the outbreak of the Thirty Years' War involved James in new difficulties.

Foreign Affairs.—Frederick, Elector Palatine, chief of the German Calvinists, who had married the king's daughter Elizabeth, gave the occasion for that war by accepting the crown of Bohemia. He was promptly expelled from Bohemia by the new emperor, Ferdinand II., and the Catholic princes of Germany, while a Spanish army overran the Palatinate. James had long fancied that he could ensure the peace of Christendom by marrying his son to a daughter of the king of Spain, who was still regarded as the foremost Catholic sovereign. He hoped thus to enlist Spanish mediation on behalf of his son-in-law. The English public, which believed that Spain was the contriver of every Catholic attack upon Protestants, and that a Spanish war would be lucrative, wished to help Frederick by attacking Philip III. Philip had not instigated the war in Germany, but he felt no desire to save a rebel and a heretic, nor did he wish to marry his daughter in England, unless the English king and people were ready to return to the Catholic faith. As it became clear that Frederick could recover the Palatinate only by force of arms, James was driven to meet a third parliament in Jan. 1621. The Commons, after making a small grant in earnest of their goodwill, went on to consider grievances, especially monopolies, which had been multiplied of late. Their enquiries led to the impeachment of Sir Giles Mompesson (the first impeachment since the accession of the Tudors) and the condemnation of Lord Bacon, the chancellor, on charges of judicial corruption. A second session having produced no further grant, James dissolved the parliament and sent one or two members to prison. He fell back on his project of a Spanish marriage. The new king of Spain, Philip IV., proving as dilatory as his father, Prince Charles and Buckingham thought to expedite matters by a visit to Madrid. By reckless concessions they obtained a marriage treaty, but the Infanta was to remain with her brother until it was known whether the promise of toleration to the English Catholics had been fulfilled. Even so, Philip refused to do anything on behalf of Frederick, and Charles and Buckingham returned bitterly resentful and determined to break with Spain. They forced James to call a new parliament in 1624. It was eager for a Spanish war which the king still hoped to avert. It also passed the one important statute of the reign, the act prohibiting monopolies. But it did not work smoothly with the Crown. A negotiation with France for the hand of Henrietta Maria, sister of Louis XIII., led the king and prince secretly to promise a toleration for the English Catholics. Soon afterward James died, on March 27, 1625.

Ireland and America.—His reign was memorable in Irish history. The submission of the earl of Tyrone almost immediately after the death of Elizabeth was followed by the enforcement of the English legal and administrative systems throughout the kingdom. A few years later Tyrone and the earl of Tyrconnel, falling under the suspicion of the Government, fled from Ireland. Their flight being construed as proof of guilt, six of the northern counties were declared forfeit to the Crown. The actual possessors were moved into the less fertile tracts, and the best land was used for the great Ulster plantations, which created a strong English and Scottish colony in the north of Ireland. (*See* PLANTATION.) The reign of James also witnessed the foundation of British rule in North America. The colony of Virginia was finally established in 1607; Plymouth, Mass., the starting point of New England, was founded in 1620.

CHARLES I., 1625–1649

Charles and Parliament.—Charles at his accession was in his 25th year. He had thoroughly imbibed his father's political principles. His chief counsellor was Buckingham, who retained with the son all the influence which he had possessed with the father. While yet prince, Charles had engaged England in war with Spain. He was also at war with the emperor, whom he could attack only by subsidizing his enemies. Charles called a parliament which met in June 1625. Zeal for the Spanish war had cooled when there was no longer the possibility of a Spanish queen. Wishing to enforce a settlement of the dispute about impositions, the Commons withheld the usual grant of customs, tunnage and poundage to a new king for the term of his life. Attached to Puritan theology the Commons saw with alarm the rise of an Anglo-Catholic (or Arminian) school of divines, who insisted on the absolute authority of the Crown because they looked to the Crown for protection.

Charles soon dissolved the parliament. In the autumn an expedition against Cadiz failed and brought obloquy upon Buckingham who, as lord high admiral, was held accountable for the defects of the fleet, although he had not taken command. Charles had to call another parliament in 1626. Led by the eloquent Sir John Eliot, the Commons impeached Buckingham and Charles dissolved the parliament to save his friend. Again he had secured no grant. Since his accession he had levied customs, tunnage, poundage and impositions by his own authority. He resorted to doubtful expedients, especially a forced loan, and punished with imprisonment or otherwise those who refused to contribute. He obtained a decision of the judges in favour of his right to imprison at discretion. Meanwhile, largely through disputes arising out of the marriage treaty, Charles had drifted into war with France. An expedition led by Buckingham to occupy the Isle of Ré, near the Huguenot stronghold of Rochelle, had failed with

heavy loss. He was thus forced to call a third parliament. The Commons adopted a petition of right by which they condemned arbitrary taxation and imprisonment, the enforcement of martial law and the billeting of soldiers as contrary to the law of the land. Charles first gave an evasive answer and then assented in the usual form. In return the Commons made a grant. In the course of the following recess Buckingham was murdered by a fanatic, and one of the ablest leaders of the Commons, Sir Thomas Wentworth, went over to the king's side. When parliament reassembled, the king and the Commons entered on a dispute about the levy of tunnage and poundage by prerogative, and the Commons spent much time in discussing the affairs of the Church. At last the king commanded the House to adjourn. Before it obeyed it passed resolutions declaring all who favoured Arminianism or paid duties not granted by parliament to be enemies of their country. Charles replied with a dissolution and sent nine members to prison. Sir John Eliot died in the Tower.

Personal Government.—The king resolved to summon no more parliaments until he could be sure of their compliance. For the next 11 years he ruled as an absolute monarch. He shaped his own policy, for nobody succeeded to Buckingham's influence. He made peace with Spain in 1629 and with France in 1630 and, although he tried diplomatic means to help his sister and her children, he took no military measures against the emperor. In order to meet necessary expenses he had to go on levying customs, tunnage, poundage and impositions, and to adopt obsolete or questionable expedients for raising revenue. In 1634 he levied shipmoney, although he was not at war, and in 1635 levied it, not merely on the coast towns and counties, but on the whole kingdom. Twice consulted, the judges twice declared that this action was legal; but the judges were liable to be dismissed at the king's pleasure. Even so, when John Hampden (*q.v.*) forced a decision in the court of exchequer chamber, five out of the 12 judges decided in his favour. At the same time the king sought to extirpate Puritanism. A devout Anglo-Catholic, he gave his confidence to William Laud, bishop of St. David's, who became in 1628 bishop of London and in 1633 archbishop of Canterbury. By a metropolitan visitation prolonged over three years, Laud enforced the Anglo-Catholic standard of doctrine and ritual. With the help of the court of high commission he made it impossible for any honest Puritan minister to keep his living. When Puritan indignation burst forth in furious pamphlets, the authors were hunted down and punished without mercy in the Star Chamber.

The Scottish Revolt.—It was in Scotland, however, that the religious revolt began. Scotland was still a feudal country where men cared little about politics. But in Scotland the Reformation had been a popular movement, the Kirk had a democratic organization, and the influence of the ministers over the Lowland population was prodigious. James had restored episcopacy and broken the power of the General Assembly. Charles continued his policy. In 1637 he sent down to Scotland a liturgy closely resembling the Anglican. The first reading in St. Giles' cathedral in Edinburgh caused a riot. Organized resistance followed. A National Covenant binding the subscribers to uphold the king's authority and the purity of the Kirk was signed by multitudes. Charles thought it necessary to allow the meeting of a General Assembly which abolished episcopacy. Then Charles prepared for war. But his army was untrained and spiritless, while the army of the Covenanters was full of enthusiasm and contained many who had gained experience as soldiers of fortune on the Continent. Charles, therefore, consented to negotiate. By the treaty of Berwick everything was referred to a new parliament and General Assembly. But fresh disputes followed. Resolved to continue the war, Charles was driven by want of money to summon the English parliament. Even Wentworth who, as president of the Council of the North and as lord deputy in Ireland, had ruled with great ability and in the most despotic temper (and about this time was created earl of Strafford, *q.v.*), advised this step, trusting to the old national grudge of Englishmen against Scotsmen. When parliament met, the Commons proceeded at once to the redress of grievances. The king insisted that they must first supply his wants, but having heard that the leaders of the Commons were negotiating with the Scots, he hastily dissolved the parliament. The arbitrary measures recommended by Strafford did not avail, however, to fill the Treasury. The Scots invaded England and occupied Northumberland and Durham. Then 12 peers petitioned the king to call a new parliament. He preferred to call a great council of the peers at York. The peers negotiated with the Scots the treaty of Ripon. But the calling of a new parliament could not be avoided.

The Long Parliament.—The parliament met on Nov. 3, 1640. The king was at its mercy, for both the English and the Scottish armies in the north had to be maintained out of the English revenue. The parliament was resolved, first to punish the king's councillors and, secondly, to make personal government impossible. Finch, the lord keeper, and Windebank, the secretary, saved themselves by flight. Led by Pym (*q.v.*) and Hampden, the Commons impeached Strafford and the archbishop. Under a forced construction of the law Strafford was charged with treason, but the evidence was weak, and the impeachment was exchanged for a bill of attainder. The assent of the Lords and the king was extorted by fear of popular violence, and Strafford was executed on May 12, 1641. Acts were passed forbidding all the unparliamentary modes of taxation employed by the king. Other acts suppressed all the extraordinary courts which had been the most effective weapons of the Crown, the Star Chamber, the Council of the North, the Council of Wales and the Court of High Commission. An act was passed to ensure that parliaments should never again be intermitted for more than three years: it was also enacted that the existing parliament should not be dissolved without its own consent. But upon ecclesiastical questions there was no agreement. A bill to abolish episcopacy was brought into the Commons, but went no further. A bill to remove the bishops from parliament passed the Commons, but was lost in the Lords. Many desired indulgence for Puritan scruples about rites and ceremonies, while some would have liked to abolish the Book of Common Prayer. None was prepared to grant unlimited freedom of conscience which was to be a dream for many years to come.

In Sept. 1641 Charles visited Scotland with the vain hope of conciliating all parties in that country. Before his return a rebellion broke out in Ireland. Its causes were national sentiment, the hatred inspired by the policy of plantation and fear for the Catholic religion. Strafford's death, and the disbandment of the army which he had formed, gave the opportunity. Beginning in Ulster, the revolt soon spread over most of Ireland and was marked by much cruelty. To raise armies and appoint commanders was the king's prerogative. But the parliament dared not trust the king with an army. The leaders of the Commons brought in the Grand Remonstrance which recited all the misdeeds of his reign, real or imaginary, and ended with a petition for the appointment of ministers whom parliament could trust. The Remonstrance was carried by a majority of 11 only. From this time the division of parties in parliament was irreconcilable. The king in his reply claimed full freedom to choose his advisers. Somewhat later his personal attempt to arrest five members, Pym, Hampden, Holles, Hazlerigg and Strode, on a charge of treason embittered the conflict. In order, however, to gain time for sending the queen to the Continent, he assented to a bill for the exclusion of the bishops from the House of Lords. When she was gone he proceeded to York, where the northern nobility and gentry flocked round him. There followed an interchange of manifestos ending with the Nineteen Propositions in which the parliament claimed amongst other things that its approbation should be necessary for the appointment of privy councillors, ministers of State and chiefs of the courts of common law. The king refused these demands. Both parties prepared for war and the king raised his standard at Nottingham on Aug. 22, 1642.

The First Civil War.—As the civil war was fought to decide political and ecclesiastical rather than economic issues, men of all classes were found on either side. But a great majority of the peers and gentry were for the king, and a great majority of traders and craftsmen with many yeomen were for the parliament. The portion of England east of a line from the Humber to Southampton Water was on the side of the parliament, while the north, the

west and Wales were mainly for the king. Holding London and nearly all the other ports, the Parliament could levy the customs and was financially the stronger. Its hold on the ports was secure, as the navy declared for the parliament. Neither party had an effective army. The only force known to the law—the militia—was ill-trained except in London and was not liable to serve outside its county, except in case of foreign invasion. Both sides tried to enlist volunteers and both had recourse to impressment. Cavalry still played a large part in battles, and in cavalry the king had an advantage, for the gentry were a warlike class with a long military tradition.

After the first battle at Edgehill and an unsuccessful attempt on London, the king established himself in Oxford, which became his capital for the rest of the war. His friends were so successful that by the autumn of 1643 he was master of three-fourths of the kingdom. The parliament then sought the help of the Scots who had hitherto been neutral, but who felt that the Kirk could not be secure unless Presbyterianism prevailed in England. By the Solemn League and Covenant the Scots undertook to help in the war, while the parliament promised, or seemed to promise, that it would adopt the Presbyterian system. The trial and execution of Archbishop Laud were a result of this alliance. Early in 1644 the Scots invaded England. With the help of a parliamentary army they gained the battle of Marston Moor (July 2), which ended the king's power in the north. His own successes in the south could not counterbalance this disaster, but drove the parliament to make a really effective army. By the Self-denying Ordinance it required all members of either House to resign their commissions, thus getting rid of several incapable leaders. It resolved to raise a new army, the famous New Model, composed of men who should undertake to serve until the end of the war and to go whithersoever they should be required. The command-in-chief was given to Sir Thomas Fairfax; the second in command was Oliver Cromwell. At Naseby, June 14, 1645, Fairfax won a victory which drove the king out of the midlands. He then conquered the southwest, and in the spring of 1646 returned to besiege Oxford. Charles fled from Oxford in disguise and took refuge with the Scottish army. Thus ended the first Civil War.

The Second Civil War.—As conditions of a settlement the parliament demanded the control of the militia, the punishment of the king's chief supporters and the establishment of Presbyterianism. The king refusing these terms, the Scots handed him over to the parliament and returned to their own country. Then a third party interposed. The war being over, the parliament wished to send part of the army to Ireland and disband another part. Before allowing themselves to be thus dispersed, the soldiers wanted payment of their arrears, and the Independants and other sectaries among them wanted to be secure of toleration. Unable to obtain satisfaction, they took the king into their custody and tried to reach an understanding with him. They offered freedom of conscience and a merciful treatment of his friends, but they desired democratic changes which would have further reduced the power of the Crown. Convinced that neither army nor parliament could stand without his support, Charles would not close with either, but negotiated with the Scots a treaty known as the Engagement, by which they were to restore him to power and he was to establish Presbyterianism in England for three years. There followed the second Civil War—a series of scattered and futile insurrections. A Scottish invading army was wellnigh destroyed by Cromwell in the campaign of Preston. Through these events the party among the soldiers which maintained that negotiation with the king was useless and that he should be tried and punished for his part in the civil wars, became supreme. The military chiefs purged the House of Commons. A remnant of 60 or 70 members, the so-called Rump, passed a bill creating a high court of justice to try the king. When the Lords rejected it, they passed it once more with a declaration that the assent of the Lords was needless. Brought before the high court, Charles refused to acknowledge its jurisdiction and, on a second and third appearance, reiterated his refusal. He was nevertheless condemned. On Jan. 30, 1649, he was executed in front of the Banqueting House, Whitehall. (*See* also CHARLES I., GREAT REBELLION, CROMWELL.)

THE COMMONWEALTH—1649–1660

The king's death was followed by the abolition of the monarchy and the House of Lords, and the proclamation of a Commonwealth. Executive power was vested in a council of state. In fact the Commonwealth was based upon the army, for the bulk of the nation held monarchical opinions and resented the rule of the sword, the heavy taxation and the suppression of popular amusements. All parties in Ireland were hostile to the Commonwealth. The Scots, upon hearing of the king's execution, proclaimed his son. No foreign power recognized the Commonwealth. Its upholders were not united. But mutiny in the army was quelled by the prompt action of Fairfax and Cromwell, and against the army the other malcontents were impotent. Cromwell, in his Irish campaign, broke up the royalist combination and conquered half the kingdom. He was then recalled to take the command against the Scots. Charles II. had been allowed to land on condition of subscribing the Covenants, but enjoyed little power. The victory of Dunbar, Sept. 3, 1650, enabled Cromwell to occupy Edinburgh. Charles resolved to invade England, where he hoped to find recruits. Taking the western road, he reached Worcester without meeting opposition, but also without gaining many adherents. Cromwell marched rapidly south, closed upon Worcester with superior forces and annihilated the Scottish army (Sept. 3, 1651). Charles ultimately escaped to France. Before the end of 1652 Scotland and Ireland were thoroughly subdued and were thenceforward ruled as conquered countries. In Ireland confiscation and plantation on a vast scale ensued.

Expulsion of the Parliament and Rule of Cromwell.—The Commonwealth had obtained recognition from France and Spain, but commercial and colonial rivalry had involved it in war with Holland. A schism opened between the army and the parliament. Afraid of the general ill-will, the parliament sought to put off its dissolution as long as possible. Impatient for certain reforms, the army pressed for a dissolution. Finally Cromwell and the officers expelled both parliament and Council of State in April 1653. There no longer existed a semblance of legal power. The Council of Officers sent letters to the congregational Churches, inviting them to nominate representatives. Out of the names thus submitted the Council chose 129 for England, five for Scotland and six for Ireland. Thus was formed the so-called Little Parliament which was really a congress of Puritan notables. Its reforms alarmed the clergy, the lawyers and the owners of property. Cromwell became convinced that the parliament would not answer: a minority made a voluntary resignation and the rest were expelled by the soldiers. (*See* BAREBONES PARLIAMENT.) From this event dates the beginning of a political reaction in England. Those officers who were attached to old institutions drew up the Instrument of Government (*q.v.*), a written constitution aiming at a separation and balance of powers. It set up (1) a lord protector elected for life and wielding executive authority; (2) a council of State nominated in the first instance and holding for life, whose consent was required for important executive acts; (3) a parliament of one chamber representing the three kingdoms and possessing legislative power. Cromwell became protector and called a parliament. When it met, the parliament claimed full power of revising the Instrument. Cromwell maintained that the essentials of the Instrument, such as the division of power between a single person and a parliament, must be regarded as beyond discussion. He thought it necessary to exclude a number of the most obstinate members, and dissolved the parliament at the earliest date possible. These events encouraged Royalist conspiracy. Then Cromwell divided England into districts, setting over each a major-general armed with extraordinary powers. The approach of war with Spain induced him, however, to call another parliament which met in Sept. 1656. Again Cromwell excluded about 100 members, while others stayed away of their own accord. Those who remained desired a further return to English tradition. By the so-called Humble Petition and Advice they offered Cromwell the crown, while they claimed for the House the sole power of deciding on its membership, and established a new House of Lords. Rejecting the title of king, which was distasteful to the army, Cromwell accepted the other provisions. After the prorogation he nominated the new

Lords. When parliament re-assembled, many of his friends had been removed to the upper house, while the excluded members took their seats. Thus the temper of the Commons was mutinous. They refused to acknowledge the powers of the Lords, and Cromwell in anger dissolved the parliament.

In his foreign policy Cromwell had two aims; to help the Protestant cause and to augment English commerce and colonies. Regretting the Dutch war, he nevertheless prosecuted it to a successful conclusion. He negotiated commercial treaties with Denmark, Sweden and Portugal. England had grievances against both France and Spain. Regarding Spain as the bitterest enemy of Protestantism, and angered by the Spanish endeavour to exclude English commerce from any part of the New World, Cromwell decided upon war with Spain, and was thus led to ally himself with France. He conquered Jamaica and Dunkirk at the cost of giving an impetus to French power and ambition. At the height of success he died, worn out by labour and anxiety.

Fall of the Commonwealth.—Cromwell was understood to have nominated his eldest son Richard (*see* CROMWELL, RICHARD) as his successor. Richard called a parliament, which the officers forced him to dissolve, as they desired more independence for the army than the parliament would allow. They recalled the Rump, which condemned government by a single person. But conflict broke out afresh, and the soldiers expelled the Rump. A Royalist reaction spread all over the country, for a Stuart restoration seemed the only escape from the rule of the sword. Monk, who commanded the English army in Scotland, and had hitherto kept aloof from politics, declared for a free parliament and marched southwards. He met with no effective opposition. The officers in England were forced to recall the Rump. The Rump welcomed Monk, but he saw that the nation was weary of them. He sent back to their seats the members expelled in 1648 and the parliament thus restored voted its own dissolution. Monk sent Sir John Grenville to Charles with advice on the offers he should make. From Breda, in Holland, Charles issued a declaration promising, subject to parliamentary sanction, a general amnesty, religious toleration and the payment of arrears to the troops. The new parliament was largely Presbyterian and almost wholly Royalist. A few peers met and resumed their sittings, which were not called in question. Both Houses sent a deputation inviting Charles to return. He made his entry into London on May 29, 1660.

CHARLES II., 1660–1685

The Restoration Settlement.—The king's chief adviser was Edward Hyde, lord chancellor and earl of Clarendon, who had been his father's ablest councillor in the Civil War. The Convention Parliament passed a bill of indemnity excepting only the regicides. It raised funds to pay off the army which was disbanded, although the king was allowed to keep a couple of regiments for his protection, the germ of the later standing army. The lands, whether of the Crown, of the Church, or of private persons, confiscated by the revolutionary government, were restored to their former owners. The royal right of purveyance and the military tenures with the burthensome incidents of wardship and marriage were suppressed in exchange for an hereditary excise settled on the Crown. Nothing was done for religious toleration. Scotland became once more an independent kingdom. All the legislation of Scottish parliaments after 1633 was declared invalid. Ireland returned to its former status. But the enormous confiscation of land under the Commonwealth was for the most part confirmed by the Act of Settlement. Soon the king and Clarendon began to diverge. A Catholic at heart, the king hoped to benefit the Catholics by linking their cause with that of the Puritans, and therefore favoured a policy of toleration. For himself he wanted absolute power. Clarendon and the Royalists wished neither for toleration nor for despotism. The new parliament elected in 1661 passed the Act of Uniformity, which drove all Puritan ministers out of the Church, and laid the foundation of modern dissent. It passed other persecuting statutes, the Corporation Act, the Conventicle Act, the Five Mile Act. Claiming a power to dispense with the law, Charles held out the hope of relief to the persecuted, but the parliament forced him to desist. Clarendon, however, became generally unpopular. The outbreak of a new war with Holland, commercial and colonial like the former, added to his embarrassments. The king deprived him of the Great Seal. A parliamentary impeachment followed. Clarendon fled to France and was condemned in absence to perpetual banishment.

The Cabal and Danby.—The king then gave his confidence to a group of men which became known as the Cabal. The ablest was Antony Ashley Cooper, later lord chancellor and earl of Shaftesbury. They helped Charles to carry out a policy of virtual toleration. After making peace with the Dutch in 1667, he concluded in 1668 with them and with Sweden the Triple Alliance, designed to hinder Louis XIV. from conquering the Spanish Netherlands. But his real aims were far different. In 1670 he concluded with Louis the secret Treaty of Dover for the conquest and partition of Holland and the restoration of Catholicism in England, a stipulation concealed from all but the Catholic members of the Cabal. Pursuant to this treaty, he began the third war with Holland in 1672. About the same time he issued a Declaration of Indulgence, suspending all penal laws in matters of religion. But the French alliance and the Dutch war were unpopular. Most Churchmen detested the Indulgence, and all friends of liberty resented the suspension of statutes by the mere will of the sovereign. The king had to withdraw his declaration and to accept the Test Act imposing the sacramental test upon all officeholders. Soon afterwards he had to make peace with Holland, while the Cabal broke up. Shaftesbury, who had discovered the stipulation relating to catholicism in the Treaty of Dover, became the leader of opposition to the king's policy. For by this time an opposition professing to defend the Protestant religion and the liberties of England, the germ of the later Whig party, had become manifest. The king took for his chief adviser Sir Thomas Osborne, whom he appointed treasurer and created earl of Danby (*see* LEEDS, 1ST DUKE OF). Danby was at once a zealous upholder of royal prerogative and a staunch adherent of the Church. Meantime the public became more and more afraid of Catholic encroachment. The king's brother James, duke of York, the heir to the throne, avowed himself a Catholic and married as his second wife a Catholic princess, Mary of Modena. The strongest Continental ruler, Louis XIV., showed himself an implacable enemy of Protestantism.

The Popish Plot.—These fears were raised almost to frenzy by the alleged discovery of a popish plot to kill the king, to overthrow the Church and to restore the domination of Rome. In the main the plot was an invention of Titus Oates (*q.v.*), although the intrigues of rash Catholics helped to make it more plausible. The opposition led by Shaftesbury, whether they believed in the plot or no, saw their advantage in it and did their utmost to inflame Protestant fanaticism. In consequence, a number of innocent persons suffered as traitors. A parliamentary Test Act was passed. On the ground of certain letters written by the king's command, the Commons impeached Danby of treason. To save Danby the king dissolved the parliament which had lasted 17 years. In the ensuing election the opposition gained many seats. Its leaders brought in a bill to exclude James from the succession. To save his brother's right, Charles offered to accept severe restrictions upon the powers of a Catholic sovereign. He also dismissed his old privy council and formed a new one on a plan devised by Sir William Temple, half servants of the Crown and half influential members of either House (*see* PRIVY COUNCIL, CABINET). As these concessions were fruitless, he dissolved the parliament, but not before it had passed the Habeas Corpus Act. In the next parliament the Exclusion bill was brought in again, passed by the Commons and thrown out by the Lords. Charles let the new privy council drop and dissolved the parliament. It was during this period of intense conflict that the two political parties which had been growing since the Restoration took definite shape, and became known as Whigs and Tories.

The Royalist Reaction.—The opposition had injured their cause by adopting the claim of the duke of Monmouth to be rightful heir to the Crown as a legitimate son of the king. Signs that belief in the plot was waning emboldened the king to summon

a new parliament. It was to meet at Oxford so that his adversaries should not have the support of the Londoners. As they would accept no alternative, but brought in a third Exclusion bill, Charles hardened himself in resistance and dissolved the parliament after it had sat a week. He determined not to call another until he could count on its submission. He published a declaration justifying what he had done, which evoked the enthusiasm of the clergy and gentry. He caused proceedings to be taken against the city of London and other corporate towns for having exceeded their lawful powers. Their charters having been adjudged forfeit into the king's hand, he granted new charters securing his control over their administration and the election of their members. At the same time the persecuting laws against the Nonconformists were sharply enforced. The opposition began to conspire, but all was detected. Two of their chiefs, William Lord Russell and Algernon Sidney, and several persons of less consequence, were executed. At his death (Feb. 6, 1685) Charles was more nearly absolute than any other Stuart king. He owed his success mainly to a close alliance with the Church of England.

JAMES II., 1685–1688

James II. broke this alliance. James was an ardent Catholic who had suffered for his faith. For his church he determined to secure, not merely toleration, but ascendancy. The parliament which he called gave him an unprecedented revenue. Its session was interrupted by Monmouth's rebellion. When it re-assembled, the king, who had increased the army, announced that he would grant commissions regardless of the Test Act, and demanded larger supplies. The Tory gentry, who abhorred a standing army and meant to uphold Anglican ascendancy, showed signs of resistance, whereupon James prorogued the parliament, which never met again. He then tried to attain his end by the exertion of prerogative. To control the Anglican clergy he set up the Court of Ecclesiastical Commission, although the establishment of such courts had been forbidden by statute. By dismissing four judges he obtained from the court of king's bench a decision in favour of his power to dispense with the Test Act. Thenceforwards he bestowed preferment on Catholics out of all proportion to their number. He tried to win the Nonconformists by a Declaration of Indulgence. To ensure the support of a future parliament, he purged the borough corporations of Anglicans and Tories. He forced Catholics into office in the universities. In April 1688 he issued a new Declaration of Indulgence with orders that it should be read from every pulpit on two successive Sundays. Archbishop Sancroft and six bishops drew up a petition asking to be excused. The king having ordered them to be prosecuted for a seditious libel, they were acquitted amid general rejoicing. The birth of a son seemed to ensure the continuance of his policy after his death. But certain circumstances gave plausibility to a rumour spread by his enemies that the child was supposititious.

The Revolution.—Discontent had by this time become general. Seven eminent persons, including Lord Danby, the chief of the Tory Party, and Compton, bishop of London, signed a letter to William, prince of Orange, the king's son-in-law and the recognized head of the Protestant interest in Europe, asking him to come to England with an armed force and to effect the redress of grievances. William, whose wife had been until lately the heiress of the crown, and who desired to enlist England in his combination of powers against Louis XIV., resolved to comply with the request. Partly by skill, partly by good fortune, he overcame all difficulties and disembarked his forces in Torbay without opposition. While he marched towards London, Danby and other disaffected lords raised insurrections in the north. The desertion of a few important men, especially of his own son-in-law, Prince George of Denmark, and of Lord Churchill, his best officer, convinced James that he could not trust his army, but must gain time by negotiating with William and issuing writs for a new Parliament. He determined to fly to France and trust to fortune for returning free from all conditions. A first attempt failed, but William contrived to alarm James so much that he made a second attempt, which succeeded. His wife and infant son had already reached France. Thus he opened William's way to the throne. William assembled the Lords, the members of parliaments of Charles II., and representatives of the common council of the City. They requested him to carry on the administration and to summon a parliament. The convention parliament met on Jan. 22, 1689. The Tories, who had for many years asserted the doctrine of divine right, were divided. Some wished to recall James under promise of amendment, some wished to establish a regency, while others, with Danby at their head, took refuge in the pretence that the king's flight was an abdication so that the crown had devolved on the Lady Mary. The Whigs, who thought the deposition of a bad king a sound precedent, held that the throne was vacant and would have liked to elect William. As a compromise, it was agreed that William and Mary should be joint sovereigns, but that William should have the sole administration. A Declaration of Right, deciding in favour of parliament practically all the constitutional disputes of the century, was tendered with the crown to William and Mary and was accepted by them. The supremacy of parliament was thenceforward assured, but the sovereign continued to be the real head of the executive.

The Revolution in Scotland and Ireland.—On William's arrival in London he summoned a meeting of notable Scotsmen, which asked him to undertake the administration of Scotland and to call a parliament. The parliament decided to offer the crown to William and Mary, together with a Claim of Right in which the most memorable clause was that abolishing episcopacy. In the Highlands, however, James Graham, Viscount Dundee, was able to raise a little army which defeated King William's troops at Killiecrankie. But Dundee's death led to the dispersing of his followers, and the Highlands were pacified with hardly any trouble. In Ireland the earl of Tyrconnel, lord deputy, acting under King James' orders, had filled the army with Catholic officers and everywhere placed Catholics in power. Many Protestants fled to England. Many found refuge in the strongholds of Londonderry and Enniskillen. Tyrconnel invited James to come and take command of the Irish in person. He came and received French assistance, but was defeated by William at the battle of the Boyne, July 1, 1690, and fled back to France. The reconquest of Ireland was completed in 1691 by the battle of Aughrim and the surrender of Limerick. The treaty then made secured to the Irish Catholics that measure of religious liberty which they had enjoyed under Charles II., but its terms were not observed in after years.

WILLIAM III. AND MARY, 1689–1694; WILLIAM III., 1694–1702

In England the Convention turned itself into a parliament in order to avoid the risks of a general election at a time so critical. The Declaration of Right was converted into the Bill of Rights, which gave the succession to Anne in default of issue of William and Mary, and excluded Catholics from the throne. By the Toleration Act all Protestant Nonconformists other than Unitarians obtained freedom of worship. The mutiny of a Scottish regiment gave occasion for the first Mutiny Act, which placed soldiers under a special law and special tribunals. It was enacted only for a period of six months, as parliament wished to keep control of the army. A new parliament in 1690 granted the customs duties to William and Mary, not as heretofore for life, but for a term of four years. It also assigned certain branches of revenue for the expenses of civil government, and others for maintaining the army and navy. The help given to James by Louis made war inevitable. England joined the coalition of which the emperor, Leopold I., the king of Spain and the Dutch republic were principal members. The war lasted eight years. The French were generally successful in battles, but the wealth of England and Holland gave the allies greater power of endurance. War completed William's dependence on parliament and made necessary the national debt. Hitherto, when loans were needed, they had been raised on the credit of the Crown. But William was not secure in his kingdom and the sums needed were beyond all precedent. In 1693, therefore, a loan was raised on the faith of an act of parliament, and this became the type of all subsequent loans. Largely in order to assist the raising of loans, the Bank of England was founded in 1694. The currency was reformed in 1696. A bill limiting the life of a parliament to three years was passed in 1694 and a bill to

reform trials for treason in 1696. The expiry of the last Licensing Act in 1694 left every man free to publish what he would, subject to the risk of prosecution for libel. A noteworthy increase of newspapers and pamphlets ensued.

The Partition Treaties.—The war was not popular, its burthens were heavy and William gave offence by his ungracious manners and Dutch favourites. But the naval victory of La Hogue (1692) ended the fear of invasion and the detection of a plot to assassinate William aroused loyalty. At length Louis became willing to treat. The Peace of Ryswick virtually restored the state of things before the war. Thus was seen the importance of English help to the enemies of Louis. Soon afterwards Louis sounded William about the Spanish succession. Charles II., king of Spain, a childless invalid, was visibly near his end. Spain was almost powerless to defend her enormous dominions. As Louis himself, the emperor Leopold and the little son of the elector of Bavaria all had claims by descent, another European war seemed likely. Therefore William and Louis framed two successive treaties for the peaceable partition of the Spanish empire on the death of King Charles. These treaties became known and exasperated the Spaniards. Finally Charles made a will bequeathing all his dominions to Philip, duke of Anjou, second son of the dauphin. A little later he died. Louis accepted the Spanish crown for his grandson. As no power could then offer effective resistance, Philip took quiet possession of his kingdom.

Meantime William had found it hard to govern England. After the Peace of Ryswick the Tories became powerful. The Commons insisted on reducing the army to a few thousand men, called in question William's grants of forfeited Irish land, and impeached some of the ministers for their share in the partition treaties which were unpopular. When the death of Anne's last child made necessary the Act of Settlement, which gave the succession to the next Protestant heir, the electress Sophia of Hanover, granddaughter of James I., they inserted clauses further restricting the power of the Crown. (*See* SETTLEMENT, ACT OF.)

Thus William could not interpose with effect in European affairs. But Louis, who controlled the actions of Philip, irritated the English by refusing them any commercial privileges in Spanish America, and by putting French garrisons into certain fortresses of the Spanish Netherlands. He thus enabled William to conclude with the emperor and Holland a treaty sometimes termed the Grand Alliance, whereby the parties undertook to procure certain satisfactions for one another. By promising James II., then on his deathbed, that he would recognize his son as king of England, and thus breaking the Treaty of Ryswick, Louis ensured a war. William's health had long been declining and a slight accident brought on a fatal illness. On March 8, 1702, he died.

ANNE, 1702–1714

War of the Spanish Succession.—Anne, his successor, was a Tory and a zealous churchwoman. She had disliked William and did not comprehend his policy. She gave office only to Tories, Lord Godolphin becoming treasurer and virtual head of the Government. There was, however, no break in the conduct of foreign affairs. Anne was dominated by Sarah countess of Marlborough. The countess, a devoted wife, used all her influence to exalt her husband. Marlborough, a lukewarm Tory, adopted without reserve William's foreign policy, which gave full scope for his military and diplomatic genius. Godolphin, who resembled Marlborough in temperament and opinions, approved of that policy. They carried queen and parliament along with them. England, Holland and the emperor were joined by several of the German princes and, somewhat later, by Portugal. Victor Amadeus, duke of Savoy, took part, at first with Louis, but afterwards against him. During the first four years of the war the allies were brilliantly successful. They drove the French out of Germany by the victory of Blenheim (1704), and out of Italy by the victory of Turin (1706). By the victory of Ramillies (1706) they secured almost the whole of the Spanish Netherlands. In Spain they captured Gibraltar and were joined by the Catalans, who hoped to recover lost provincial liberties. Dismayed by so many reverses, Louis at the end of 1706 sued for peace. The allies, who had agreed to recover the whole Spanish inheritance for the archduke Charles, second son of the emperor Leopold, refused the offer. During the next four years they conquered Naples, Sicily, Sardinia and Minorca, but they failed in an invasion of southern France, and in Spain they suffered a ruinous defeat at Almanza. By the victories of Oudenarde (1708) and Malplaquet (1709) they prepared for an invasion of France, but the siege of the border fortresses was a tedious process. Yet the more and more tempting offers made by Louis were obstinately refused.

Parliamentary Union of England and Scotland.—At home the Godolphin ministry achieved the parliamentary union of England with Scotland. The Scots desired to share in English commerce and colonial enterprise, which they could only do by a closer union with England. Yet the Scots cherished their legal independence; above all, they were concerned for the safety of the Kirk. In 1704 the Scottish parliament passed the Act of Security to the effect that upon Anne's death the successor to the throne should not be the same as in England, unless securities were obtained for the religion and liberties of Scotland. The English parliament replied to the Act of Security with an act which declared that Scotsmen should be treated as aliens unless the Scottish succession were settled like the English. This led to the appointment of commissioners of both kingdoms to draft articles of union. They finished their work in July 1706. The number of Scottish representatives, 16 in the Lords and 45 in the Commons, was based partly on population and partly on revenue. Scotland retained its own laws and courts of justice, and was to pay £48,000 in land tax when England paid £2,000,000. Separate acts, incorporated with the Act of Union, ensured the independence of the two Churches. The Union took effect on May 1, 1707. It was highly unpopular in Scotland and could hardly be called popular in England.

Tory and High Church Reaction.—The foreign policy of the Government was repugnant to the Tories, who detested a standing army, heavy taxation and the national debt. Marlborough and Godolphin were thus compelled to seek help from the Whigs, and by degrees admitted so many to office that at the end of 1708 the ministry was Whig rather than Tory. It therefore lost the queen's goodwill; the duchess of Marlborough, too, had lost the queen's favour and the nation at large was growing weary of the war which, in spite of so many victories, seemed endless. A certain high church clergyman, Dr. Henry Sacheverell, having assailed the ministers in virulent sermons, attracted so much notice that they resolved to impeach him. He became a popular hero, the queen attended the proceedings and the Lords did not venture to inflict more than a nominal penalty. The queen then took courage to dismiss Godolphin, and gave office to Robert Harley and Henry St. John, who in former years had served under Godolphin but had been dismissed. They decided upon a general election, which produced a strong Tory majority. Then they resolved to end the war. They began a separate and secret negotiation with Louis, which became public in the course of 1711. At the end of that year, having collected evidence which cast suspicion of corrupt practices upon Marlborough, they felt able to dismiss him and give the command-in-chief to a Jacobite, the duke of Ormond, who had orders to remain inactive. A congress was opened at Utrecht early in 1712, but Louis became more and more unyielding, so that the definitive treaties were not signed until April 1713. (*See* UTRECHT, TREATY OF.) By the treaty England kept Gibraltar and Minorca, and acquired from France Nova Scotia, Hudson bay and Newfoundland. She also obtained trading rights in Spanish America, especially a monopoly of the increasingly valuable slave trade.

At home the ministers tried to secure permanent ascendency for Tories and Churchmen. In 1711 they passed an act requiring a qualification in landed property for members of parliament. A bill to punish the occasional conformity by which dissenters ambitious of office sought to evade the Test Act had been passed by the Commons in 1703, and again in 1704, and both times had been thrown out by the Lords. It was revived and passed into law in 1711. In 1714 the Schism Act took from dissenters the right of educating their own children. But the ministry was weakened by

the rivalry, at last rising to enmity, of its two chiefs. Harley, who in 1711 was created earl of Oxford and Mortimer, took alarm at the violence of his followers and wished to moderate reaction. St. John, who in 1712 was created Viscount Bolingbroke, was ready to go all lengths and intrigued with the Pretender so as to have an alternative if he could not make terms with the elector of Hanover. He induced Anne to dismiss Oxford and to make the duke of Shrewsbury treasurer. Almost immediately afterwards Anne died, Aug. 1, 1714. (F. C. M.)

IX. THE HANOVERIAN KINGS, 1714–1789

The period during 1714–89 in British history has an essential and internal unity alike in politics, thought, and economic and social development, marked off from the 17th century which really ended in 1714, and the period of revolution and world-wide war which commenced with the fall of the Bastille on July 14, 1789. It began with one bloodless British revolution, the accession of George I., which consummated the "Revolution of 1688" and it closed with the opening of a European revolution that left Great Britain intact, but convulsed the world in which the British State stood unshaken. The consolidation of the parliamentary State, *i.e.*, a commonwealth governed by a limited and constitutional monarchy by and with an executive responsible to a parliament of two chambers, and with a judiciary independent of the executive and the legislature, is the main feature of this broad and unified period, called the 18th century, which correctly speaking closed in 1789. When George I. succeeded to Anne, in virtue of the statutory definition of the succession laid down in the Act of Settlement (1701), government by the Crown in and through parliament was an experiment that still had to make good. The French Revolution of 1789 found parliamentary government in Great Britain established in principle, and proved efficient and acceptable in practice. The period of the Hanoverian kings, therefore, if it had accomplished nothing else, had laid an unshakeable foundation for the developments of the 19th century. This achievement was mainly the work of the Whig supremacy of the first 60 years of the 18th century. This supremacy rested on and expressed the aims of a virtual alliance between a majority of the aristocracy, with an overwhelming majority in the House of Lords, and a masterly control of the representation in the House of Commons, the trading classes and the nonconformists. It was not until the middle of the reign of George III. that the country gentry and the Church of England definitely accepted the principles of the Whig system, and a new combination of the social forces of the community became possible. The result was a new Tory Party which had shed the principles of Jacobitism, of a divine right monarchy and of an executive not dependent on the legislature. The rise of the New Tories dissolved the Old Whigs and for 30 years Whiggism repeated the old formulae while it sought for a new faith and new convictions under the hammer strokes of the American and French Revolutions. The downfall of Bolingbroke in 1714 really ended the Toryism of the 17th century, and the watershed of Whiggism is crossed in the careers of Burke, the younger Pitt and Charles James Fox. Subordinate to this dominating political movement are important moulding forces and movements—John Wesley and Methodism (*qq.v.*), the "Agricultural Revolution" (*q.v.*), which transformed the technique of agriculture (*see* AGRICULTURE; ENCLOSURES), the Industrial Revolution (*q.v.*) which transformed the parliamentary State into the industrial "workshop of the world," which dates from 1770, and the steady and continuous development of the Empire (*see* BRITISH EMPIRE), marked by the great disruption of 1783. The Deist and Methodist movements belong more strictly to the history of thought and of the Church of England; agriculture and industry make chapters by themselves in national development; but the play of the purely political forces can only be fully understood if they are correlated to the internal political development and the "Expansion of England." Great Britain by 1789 was politically, socially and economically ripe for an era of fundamental reform. The French Revolution and the titanic struggle with Napoleon delayed the Reform movement (*q.v.*) for 30 years and very nearly transformed it into a revolution.

THE AGE OF WALPOLE, 1714–1742

The First Phase: 1714–21.—The peaceful accession of George I., which to Tories such as Swift and Atterbury seemed a "miracle," was due to the political incapacity of Bolingbroke, the fine organization of the Whigs who were ready when a divided Tory Party was not, and to the common-sense of the majority of Englishmen who were prepared to let the Elector of Hanover come and have a fair trial, but were not prepared to invite the Roman Catholic son of James II. to start a civil war as the justification of a hereditary, but not a statutory, title to the throne. The Whigs realized that this German-speaking king, ignorant of England and English mentality, would only stay at Windsor if his government were made acceptable. The new king knew that without the Whigs he was a king without a kingdom, and the Whigs knew that without George I. they had a kingdom without a king. They concentrated on essentials. Time and statesmanship could solve the problem. Meanwhile let the king and court be German, and the government English and for England. There was a double practical problem—internal, to keep order and reconcile the nation to a "foreign" sovereign and court (with an awkward appendage in Hanover)—external, to control foreign policy so as to keep England out of war. The ministry of Stanhope (1714–21) was a masterly achievement of both ends. The Jacobite Rebellion of 1715 was a miserable fiasco. France refused to stir; "James III. and VIII." arrived too late and had no gift of leadership; and at Preston (place of ill-omen for Stuart adventures) the rebellion was quenched. The Riot Act of 1715 is the one permanent survival of this mismanaged miscarriage of Jacobite sentiment. The Septennial Act followed (1716), and by a daring assertion of parliamentary supremacy repealed the Triennial Act, postponed a general election, and made such elections necessary only every seven years. It lasted as the law of the land until 1911. In foreign policy Stanhope deserves fame for the Triple Alliance (with Holland and the France of the regent Orleans), for the crushing of Alberoni's schemes, for the Treaty of Passarowitz which ended the war in the East (1718), for the conversion of the Triple into a Quadruple alliance (1718) by bringing in the Emperor, and for the series of treaties (1721) which ended the war that had raged in the north of Europe since 1698.

The Second Phase: The Ministry of Walpole.—In 1717 there was a sharp schism in the Whig Party; Townshend, Walpole and Pulteney left the ministry and Walpole accentuated the division by defeating the Peerage Bill in the House of Commons. This measure which limited the royal prerogative to create peers, would have made the only avenue to the House of Lords "through the winding-sheet of a decrepit lord or the grave of an extinct noble family" and removed the constitutional means of overcoming the opposition of the Lords to a decision of the Commons and the constituencies. The crash of the "South Sea Bubble" (*q.v.*), due to the reckless finance of the ministry and an orgy of speculation in the nation (1720) discredited the Government. Walpole, who had rejoined the ministry as chancellor of the exchequer in 1720, was, by the death of Stanhope, the leading political figure. Promoted to be first lord of the Treasury, with Townshend as secretary of State, he founded the famous administration which rightly bears his name and which lasted for 20 years, a longer continuous period than that of any ministry before or since.

Sir Robert Walpole was the last and the greatest of the true Revolution Whigs; he stood for a "system" both in home and foreign policy; the 20 years, 1721–42, are the history and justification of that system; and his fall was the fall of that system. At home his main object was to complete the reconciliation of Great Britain to the new dynasty, and by wise finance, avoidance of unnecessary controversies—particularly on religion—and by the maintenance of order and prosperity, prove the efficiency of parliamentary government on principles laid down in the Revolution settlement of 1689. Walpole was intensely English, and a Whig to the core. By 1742 he had made the House of Commons the real centre of political gravity and the cabinet (*q.v.*) an effective organ for linking executive and legislature together. He grasped that parliamentary government was party government; he led the Whigs as a party leader; he was the first and one of the

greatest of British prime ministers (though he never claimed the title) and one of the three or four memorable finance ministers in two centuries. His foreign policy (directed until 1730 by Townshend) was based on the necessity of peace; he refused to intervene in the wars which shook Europe; he maintained the alliance with France which he used to solve the complicated problems that from 1721 onwards are only intelligible by detailed study. Alike in 1725, 1729, 1731 and finally in 1738, Great Britain was instrumental in bringing about elaborate treaty settlements which prevented or ended devastating wars on the Continent.

Walpole's tenure of power was not seriously shaken either by the quarrel with and retirement of Townshend (1730), the accession of George II., whose gifted queen, Caroline of Anspach, was Walpole's stoutest ally until her death in 1737, or by the failure to carry his Excise bill in 1733 against the ignorant fanaticism of the country. But in 1739, popular clamour voiced by the elder Pitt, the Whig dissidents and the Tory Party, forced him into war with Spain—"the war of Jenkins's ear." This colonial and commercial quarrel, which Walpole had really settled satisfactorily by negotiation, became merged in the War of the Austrian Succession begun by Frederick the Great in 1740. The war with Spain was mismanaged, for Walpole was no war minister and his cabinet was hopelessly divided: the alliance with France was worn out. The "system" at home and abroad in fact had collapsed. Defeated in the House of Commons, Walpole resigned. His health was broken; he had done his work; he had been the main force in creating a new England and a new age, which he did not understand and which did not understand him. He left no successor of a like calibre or with the same remarkable combination of gifts. But he had stamped his personality and political principles on two generations.

THE AGE OF CHATHAM, 1742-1775

The 33 years that followed Walpole's fall are dominated by the genius and the defects of William Pitt the elder, first earl of Chatham. They commence with the struggle of "the great Commoner" to secure office and power against the established Whig families, the sunshine and splendour of the great ministry of Pitt from 1757-61, the accession of a young king, George III., who with the new Tory Party first divided the Whigs and then destroyed the Whig supremacy, and they concluded with the civil war in the British Commonwealth, commonly called the "War of American Independence" against which Chatham led the opposition, and which ended with the disruption of the British empire. In these 30 years the elder Pitt proved himself to be head and shoulders above all his contemporaries, yet the most intractable of colleagues and in all the arts of party organization, essential for parliamentary government, defiantly ignorant, and, for his own leadership, tragically deficient.

The ministry of Henry Pelham, 1743-54, maintained Whig solidarity and a coalition of Whig forces for 11 years, but its conduct of the British share in the War of the Austrian Succession, brought it no credit either on land or on sea. Great Britain won Cape Breton in 1744 and lost Madras, and was defeated at Fontenoy (1744) and Raucoux (1746). The Treaty of Aix-la-Chapelle of 1748 was, in reality, a truce which settled neither the British claims on Spain which had caused the war in 1739, nor the issues raised between Prussia and the House of Austria. The war and the peace only made clear that the alliance with France had passed into open antagonism in every quarter of the globe. In 1745 had occurred the dramatic episode of the second Jacobite rebellion under the leadership of Prince Charles Edward, "the young Pretender." Victorious at Prestonpans, he marched to Derby, retreated, and won a second victory at Falkirk. At Culloden (April 16, 1746), Jacobitism was finally extinguished by the duke of Cumberland. The Hanoverian monarchy was never again in Great Britain seriously challenged. Highland Scotland was remodelled by a series of administrative measures and the union with England entered on a new and happier chapter for both countries.

Henry Pelham's death (1754) broke up the Whig coalition which the duke of Newcastle failed to re-solder. While Great Britain drifted into war with France (1756) for which she was quite unprepared, the politicians wrangled, combined and recombined. Finally William Pitt, who had first obtained office under Henry Pelham "borrowed Newcastle's majority" in the House of Commons and formed a coalition (1757) with Newcastle and Fox, in which Pitt was the supreme figure with the confidence of the nation. The next four years justified Pitt's belief in his own powers, and the trust that his countrymen placed in him.

The Seven Years' War, 1756-63.—The Seven Years' War was a combination of two separate and deeply founded rivalries—a maritime and colonial struggle on the seas, in North America and the Indian peninsula between Great Britain and France, and a purely continental struggle between the House of Austria and Prussia under Frederick the Great. It was prefaced by "The Diplomatic Revolution," more accurately described as a reversal of the diplomatic system on which the policy of the European States had hitherto been based. In order to crush Prussia the House of Austria abandoned the alliance with Great Britain and obtained an alliance with France, combined with an alliance with Russia. Prussia, isolated, found an alliance with an isolated Great Britain. When the war broke out Great Britain and Prussia were confronted with a coalition of France, Russia, the House of Austria and the Germanic States that supported the Habsburg empire. The fate of Prussia was thus linked up with the fate of the British empire. The war, as so often, opened disastrously for Great Britain. The British had lost Ft. Duquesne (1754), and Braddock's expedition to recover it (1755) ended in the annihilation of the troops; operations against Ft. William Henry and Louisburg, and against Rochefort were failures, and Minorca, for failing to relieve which Admiral Byng was court-martialled and shot, was lost (1757). Pitt had, however, now established his supremacy in the Government and rapidly showed his genius for conducting a war. Confidence, competence and victory dispelled disillusionment, incompetence and defeat. Pitt grasped and enforced two principles—the power vested in the command of the sea, and the value of focussing a superiority of force on a strategic centre instead of dissipating it on varied and unconnected efforts. Ft. Duquesne was recovered and Louisburg recaptured; the British fleet blockaded the French coast. "The year of victory" (1759) followed. Guadeloupe and Ft. Niagara were captured; Quebec fell after Wolfe's victory on the Heights of Abraham; British troops materially aided in the decisive defeat of the French at Minden; and the French fleet was crushed in Lagos bay and off Quiberon. In India Clive had avenged the outrage of "The Black Hole of Calcutta" by the victory of Plassey (1757) which made the East India Company master of the three rich provinces of Bengal, Orissa and Behar. Pitt was determined to fight the war to a decisive finish. In 1760 the conquest of Canada was completed by the capture of Montreal; in India a victory at Wandewash led up to the capture of Pondicherry; Dominica in the West Indies was taken, and Belle Isle, commanding the French coast, stormed and captured. France, to avert defeat, had but one card left to play—to bring in Spain (as agreed by the Third Family Compact of the Bourbon dynasties in Paris, Madrid and Naples). Pitt's ultimatum to Spain, to anticipate the blow, was rejected by the cabinet and he resigned (Oct. 5, 1761). Three months later Spain declared war; Great Britain had lost three months, her invaluable war minister, and the alliance with Frederick the Great, alienated by the withdrawal of his subsidy. Lord Bute who had replaced Pitt and Newcastle carried on Pitt's war measures. Martinique, Granada, St. Lucia, St. Vincent, Havana (in Cuba) and Manila in the Philippines were captured by the expeditions that Pitt had planned. Bute, however, meant to have peace at any price, with or without Britain's allies. The Peace of Paris (Feb. 10, 1763) brought to Great Britain, Canada, Nova Scotia, Cape Breton, a group of West India islands and an assured position in India; but Bute's clumsy and reckless diplomacy threw away without compensation many valuable acquisitions, and if the independence of Prussia was maintained, Frederick owed it, as he claimed, not to his "treacherous" ally, but to his own genius and the luck that in the supreme crisis, changed Russia from a foe to a friend. The terms of the treaty, denounced by Pitt's unanswerable criticism,

ENGLISH STATESMEN

1. John Hampden (1595–1643)
2. Sir Robert Walpole, earl of Orford (1676–1745)
3. William Pitt, 1st earl of Chatham (1708–78)
4. Edmund Burke (1729–97)
5. Charles James Fox (1749–1806)
6. William Pitt the younger (1759–1806)
7. George Canning (1770–1827)
8. Sir Robert Peel (1770–1827)
9. Viscount Palmerston (1784–1865)
10. Benjamin Disraeli, earl of Beaconsfield (1804–81)
11. William Ewart Gladstone (1809–98)
12. Joseph Chamberlain (1836–1914)

were only forced through parliament by the remorseless corruption of Henry Fox. The victorious end of the war and the parliamentary rout of the Whig coalition were precisely the prelude to his reign desired by the young king, George III., who in 1760, had succeeded his grandfather on the throne.

George III. and the "New Monarchy."—It was the fate of this young prince to rule nominally for 60 (actually for 50) of the most momentous years in British history, 32 of which were absorbed in war (apart from wars in the over-seas dependencies of Great Britain)—a period which saw the Industrial Revolution subverting the history and settled order of social life begun and consummated, the civil war and disruption of the empire in North America, the Pacific brought into the orbit of European policy by the explorations of Capt. Cook, the French Revolution, and the titanic struggle with Napoleonic France, the grant of Irish autonomy (1782) followed by revolution and civil war in Ireland, the destruction of the Whig system and the reconstruction of parliamentary government. The reign closed in 1820 with the prelude to what, but for the Reform act of 1832, would have been civil war and revolution in Great Britain. That the monarchy not only survived, but was a force through these momentous 60 years, was a tribute, not to the intellectual gifts or political insight of the king (for these were mediocre and surprisingly limited in range and vision) but to solid qualities of character. The first two Georges were German princes reigning in a British kingdom which they neither understood nor assimilated. George III. was, by training and temperament, English, and he exhibited both in youth, middle and old age, the virtues and defects of middle-class English insularity. The only logic which influenced him was the logic of fact; and it was the fact, not the logic, that compelled a reluctant acquiescence in conclusions though not in a new point of view. The ambitions of the new and young king inaugurated "a new monarchy." He was determined to make the Crown, not merely as an institution but as a person, the decisive power in policy and government. This involved the destruction of the Whigs and the Whig system. But even had George III. been simply a replica of George II., a remodelling of the system and a re-grouping of the parties and social forces in Great Britain would have followed the Peace of Paris in 1763.

The two great strongholds of Toryism—the country clergy and the country squire, the manor and the parish church, on which English life from the Reformation to the French Revolution was solidly built—had shed their Jacobitism and their political theory of a king ruling *divino iure*, and were ready to assert their right against a handful of territorial magnates (with the Nonconformists and commercial middle class) to make the policy and conduct the government of their country. Pitt's career and achievements had been a corrosive and dissolvent acid of Whiggism. A Whig of the Whigs in the fundamentals of his creed he had forced the Whig magnates to accept his leadership, while he had voiced the patriotism and aspirations of the manor and the rectory. The Whigs had ceased to be a party led by able statesmen; they had degenerated into a group of clans ranged round a dozen chieftains as quarrelsome, vindictive and jealous in their rivalries as Campbells, Frasers, Macleods or Macdonalds in the heyday of Highland Scotland. That parliament in 1763 did not represent the constituencies and that the constituencies did not represent the nation is the one sovereign and tragic fact in British history between 1760 and 1792; and this fact wrecked alike the Whigs, the later career of Pitt the elder, and the system of George III. which crashed in 1783.

Personal Monarchy.—The dreary kaleidoscope of ministries—Bute, Grenville, Bedford, Rockingham, Pitt, who became earl of Chatham, and finally North (which lasted during 1770–82)—was due to the refusal of the king to work with the successive groups and the refusal of the groups to work with the king. The king's determination to make parliament a submissive organ of the royal will was responsible for the gross mismanagement of the struggles which converted in the person of John Wilkes (*q.v.*) a libertine demagogue into the triumphant champion of constitutional law and liberty. Parliamentary privilege, the law of libel, general warrants, the rights of the electors in the county of Middlesex and the publication of debates provided material for permanent and beneficial definition. Burke's *Thoughts on the Causes of the Present Discontents* (1770), re-stating the principles of cabinet and party government, with Adam Smith's *Wealth of Nations* (1776) redeem the period by their foundation of a philosophy of national policy on the transient issues of an empty day. The acid test of statesmanship came from the American colonies and the action of the home government.

The American Colonies, 1760–75.—The 13 colonies on the eastern coast of North America had, down to the accession of George III., been governed on an imperial system which allowed them a large measure of internal autonomy, but subjected them to a code of mercantile economics, defined in the Navigation Acts and other statutes of the imperial legislature at Westminster, which implied that the colonies were an integral part of an undivided British empire to be governed as a whole alike for defence, commerce and foreign relations. Grenville's Stamp Act (1765) imposing internal taxation by an imperial statute illustrated this system, because it required a colonial contribution to imperial defence from which the colonies directly benefited. The colonial opposition to this and subsequent measures of legislation and coercion, culminating in the Declaration of Independence (July 4, 1776) challenged the whole system. Three cardinal results since 1660 had really destroyed its basis. As the *Wealth of Nations* proved, the economic mercantilism of "the old colonial system" was obsolete in its principles and no longer true to the facts either of colonial or British trade. Thirteen weak and struggling "plantations" had become, unconsciously, a nation of three millions of prosperous English-speaking men and women with an inherited right to self-government in a vast country 3,000 miles from Westminster, ignorant of their needs and their capacity. The conquest of Canada and the removal of the French danger pared the need of imperial protection to a minimum. In the light of present knowledge two conclusions on the embittered controversy between 1763 and 1776 are certain. The policy of the home government, ignorant, prejudiced and blind to the facts, precipitated a crisis in 1775. But that crisis would have arisen even if there had been no George III. or Lord North, unless Great Britain had been prepared to anticipate the challenge by a drastic reconstruction of her whole system of economic policy and of imperial administration and defence. The American War of Independence which developed from the Penal Acts of 1773 into the first bloodshed at Lexington (April) and Bunker's Hill (June 1775) was a civil war of two radically different societies in America and Great Britain, speaking the same language, sprung from the same racial stocks and with a common heritage of law, institutions and religion. Chatham was the one statesman who could have resolved the deadlock; but Chatham's criticism of the king's policy made him a "trumpet of sedition"; he had destroyed the party without which he could not make or maintain a ministry and by 1775 he was a physical and mental wreck. His death in 1778 ended an epoch.

THE DISRUPTION OF THE EMPIRE; AND REFORM

The War, 1775–83.—The war that began at Lexington developed into a war of Great Britain against half the world—the Bourbon Powers of France and Spain, Holland, and "the armed neutrality of the North" formed by the Scandinavian States, Russia and Prussia, in defence of the rights of neutrals. But for the legislation of 1782–83, which freed Ireland from the fetters imposed in 1719 on her legislative and economic autonomy, a second civil war against united Protestants and Catholics might have been added. The incompetence of Lord North's ministry to avert the struggle in the North American colonies and to anticipate or prevent the intervention in 1778 of France in the struggle, was exhibited in the conduct of the war itself. The army was quite inadequate for the tasks imposed upon it; and the navy had been allowed to fall far below the strength required to assure the command of the sea. It was the loss of the command of the sea which was responsible for Cornwallis' surrender at Yorktown (1781), and which for two years placed Great Britain and the empire in the gravest peril it had so far faced. Lord North's

ministry stands convicted of unpardonable and preventable blunders, which rightly shattered the system of personal government embodying the principles of George III. At the commencement of the struggle a majority in Great Britain supported the ministry against the powerful, eloquent and determined opposition of a large minority voiced by Chatham and Burke, and above all Charles Fox. The disasters, the corruption, the lack of unity in policy and direction slowly turned the minority into a majority which by a vote of the House of Commons ended the ministry of Lord North (March 1782). The American catastrophe thus saved the system of responsible parliamentary government working through a cabinet, representing a committee of the party which had and could retain a majority in the House of Commons; it administered the *coup de grâce* to the delusive ideal of a "Patriot King," ruling as well as reigning through a legislature dominated by "The King's Friends" and through departmental chiefs dependent both for power and policy on the Sovereign who was his own prime minister. Had North's ministry known its business it could have crushed the armed resistance of British subjects in America before France had either the power or the will to intervene. Despite Washington's heroic efforts the American "rebels" realized that without France they must be beaten in the end, and Burgoyne's disaster at Saratoga (1777) was more persuasive at Paris than Franklin's diplomacy. With French intervention in 1778 Great Britain was at bay with the crisis which ministerial lethargy and blindness had created. Fortunately, Great Britain had great men in her hour of need whose splendour and obstinacy redeemed the government's blunders. India was saved by Warren Hastings; Canada by Carleton; Gibraltar by Elliott; the command of the sea by Rodney. But Cornwallis' surrender at Yorktown convinced even the king that the war in North America must be abandoned. A separate treaty (1783) with the American colonies granted the independence proclaimed in 1776. The 13 North American colonies passed out of domestic British history. The United States of America (a new republic in the new world) were born. The tragedy of their birth, both for the mother from whom they sprang and for the child thus ushered into the political firmament, was the black and angry memories of the issues raised and of the struggle itself which were to poison for a century and a half the relations of the two great branches of the English-speaking race.

With her other enemies Great Britain also made a disadvantageous peace. St. Lucia and Tobago, Senegal and Goree, Pondicherry and the French establishments in Bengal went back to France; Florida and Minorca to Spain. Fox, who negotiated the peace with Vergennes, obtained as counter-concessions some West India islands for Great Britain. France might indeed be content. Her navy had shown itself remarkably capable, and in the disruption of the British empire the world decided that she had inflicted a mortal wound on her secular antagonist.

Peace, Retrenchment and Reform, 1783–89.—The world was wholly wrong. The recuperation of Great Britain in the nine years that intervened between the independence of the United States and the wars of the French Revolution surprised Europe and can safely be attributed to the restoration of a healthy parliamentary and party system of government, to the wise and liberal policy of the younger Pitt, and to the growing intellectual and economic forces which make the first chapter of the Industrial Revolution. The general effect, more difficult to measure, of Wesley and the Wesleyan movement from 1740 onwards on the whole tone of the national life, must certainly be reckoned amongst the most powerful of the regenerative elements. These nine years in fact were a remarkable period of powerful minds and personalities, of fertilizing ideas and constructive effort in every sphere of the nation's activities.

A reconstructed Whig party under Lord Rockingham took the place of North's effete and discredited ministry. Burke's fine measure of economic reform, apart from the restoration of the cabinet system, was a notable achievement. On Rockingham's death Fox made the capital blunder of his life when he combined with North in the coalition Government, rightly resented by the nation and hateful to the king, whose unconstitutional acts in securing the defeat of the "India Bills" in the House of Lords and in dismissing the ministers, were condoned as an arbitrary retribution on a cynical disregard of the principles of a regenerated public life. The young Pitt's courage in accepting office was rewarded by a sweeping victory at the general election; and if the king had satisfied his vengeance on the Whigs and "the deserter" North, Pitt had made himself indispensable to the Crown. The nation, like the House of Commons, welcomed the youthful prime minister not as "a chip of the old block," but as "the old block itself."

Pitt completed the work of the Rockingham Whigs in noiselessly securing that the prime minister should be the head of the cabinet, that the cabinet should be a cabinet, not a group of departmental executive chiefs, and that it must depend on the confidence of the House of Commons. He reorganized the government of India successfully, though on less drastic lines than Fox's ill-fated measure; he reconstituted national finance and credit, and by the establishment of the Consolidated Fund laid the basis of the modern system; his economic treaty with France (1786), and the reduction and simplification of an antiquated code of contradictory tariffs proved his grasp of the principles of Adam Smith; the Canada Act of 1791 and the commencement of the colony of New South Wales in Australia opened a new chapter in the evolution of the British empire; a sane and peaceful foreign policy restored the shattered prestige of Great Britain in Europe. Pitt suffered three serious defeats. His proposals for placing the economic and financial relations of Great Britain and Ireland on sound lines were rejected in Ireland and dropped in England; his moderate schemes of parliamentary reform, urgently needed, were defeated by the ministerial party and abandoned by the prime minister; in 1791 his ultimatum to Russia had to be withdrawn; and his failure to support Warren Hastings, and his personal attitude towards the charges which led to his impeachment, that started in 1788, was a regrettable error of judgment, when Hastings's services both to India and Great Britain are impartially measured. It is no less unquestionable that if his powerful influence had been used as freely as his eloquence for the abolition of the slave trade, it would not have been deferred until 1807.

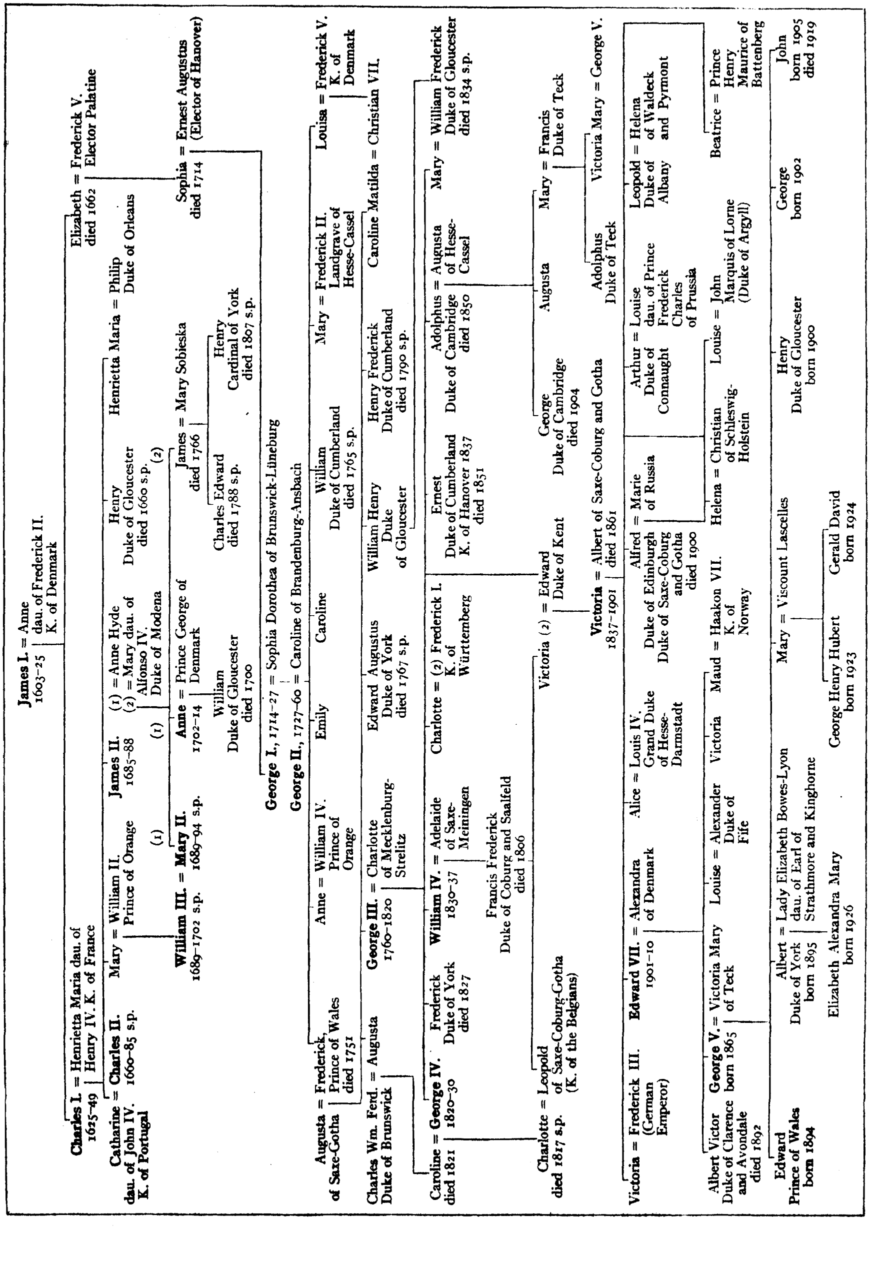
By 1789 the country was yearly becoming more ready for large and continuous instalments of political, economic and social reconstruction, and the organized demand for reform was creating an educated public opinion within and without parliament which would have proved irresistible before the century closed. It was across this Great Britain marked by such minds and characters as Howard, Hannah More, Wilberforce and Simeon, Bentham, Paine, Godwin and Cartwright, Arkwright, Cavendish, Black, Herschel, Crompton and John Hunter, the young Wordsworth and the young Coleridge, Crabbe, Cowper and Burns, that first the sunshine and then the deepening shadows of the French Revolution fell. Although Great Britain did not at first recognize it, the 18th century had really closed three years before; in Goethe's phrase, the Cannon of Valmy (1792) proclaimed the opening of a new age and a new world.

(C. G. Ro.)

X. THE REVOLUTIONARY PERIOD, 1789–1832

Under the seeming immobility of the Georgian era potent forces were working for change. By 1789 the Industrial Revolution (*q.v.*) was beginning to drive weavers and spinsters from the cottage to the factory, and to deplete the eastern and southern districts in favour of the north and west where water-power and coal were abundant. The new townships, dependent on nature's forces and man's inventions, cared little for tradition and began to chafe at control by a parliament representing imperfectly even the old agricultural England. The ever growing commercial class also became politically clamant. Above all, there now came from France a clarion call for freedom and equality which awakened echoes even in the semi-somnolent England of George III. Yet the French and English movements for reform, though alike aiming at the freedom of man from outworn laws, were destined to clash, with results infinitely disastrous. To outline the chief causes and consequences of this collision is here the guiding purpose.

GENEALOGY OF THE HOUSES OF STUART, HANOVER AND WINDSOR



First, to avoid hostility was far from easy at the end of a century punctuated by five desperate wars in which France figured as "the natural enemy." After she finally tore in half the British empire, national animosities were so keen that quick advance implied assault. Secondly, the attitude of the two peoples towards monarchy was curiously divergent. Early in 1789 the loyal acclaim of the French, on Louis XVI.'s summoning the States General for the reform of abuses, seemed to promise a longer duration for the house of Bourbon than the house of Hanover, when contrasted with the factious wranglings at Westminster occasioned by the lunacy of George and the intrigues of the prince of Wales for unrestricted power as regent. The prudence of Pitt and the opportune recovery of George soon ended the crisis, to the joy of all except the prince and his Whig supporters; but while the English monarchy took firmer hold of the people, Louis XVI., lacking foresight and finding no sure guide, saw the loyal States General soon metamorphosed into an almost hostile National Assembly; and, the end of the year 1789 found him, his unpopular queen, the court and the assembly virtually prisoners in Paris. In the next years English and French politics diverged ever more widely. While George III. and Pitt in 1790 successfully rebutted the claims of Spain to exclude England from Nootka sound and the northern Pacific, France, in spite of noble efforts at national renovation, fell a prey to disorder, discredit and bankruptcy. After the death of Mirabeau and Louis's futile attempt to escape to Germany, her discords became incurable. Suspicion and class hatred bred a fanatical republicanism hostile to all thrones and leading to war with Austria (April, 1792).

Meanwhile Fox's indiscreet praise, and Burke's eloquent denunciations, of the French Revolution split up the Opposition and sent up a solid Tory majority in the general election of 1790. During the debates on the Canada Act of 1791 Burke abjured Fox; and by degrees the New Whigs under Fox and Sheridan separated from the Old Whigs, led by the duke of Portland, Burke and Windham, who now opposed all change. Pitt, aided by his cousin Lord Grenville at the Foreign Office, pursued a peaceful policy, and in 1792 lessened the armed forces and taxation, but now scouted all proposals for reform. The overthrow of the French monarchy and the September massacres at Paris increased the tension; but the cabinet, while not recognizing the French Republic, treated with it unofficially. Nevertheless a series of aggressive decrees passed at Paris, in Nov.–Dec., 1792 (culminating in two which threatened Britain's Dutch allies) portended a rupture, which would have occurred even if the republic had not on Jan. 21, 1793, executed Louis XVI. On the consequent expulsion of Chauvelin, the French "ambassador," the French convention (assembly) unanimously declared war on Great Britain and Holland (Feb. 1, 1793). The leading Jacobins (*q.v.*) vainly hoped to overrun Holland, seize her riches and her fleet, and rouse the English republicans to overturn the throne.

THE FRENCH WAR

The First Phase.—In the ensuing war the following phases may be noted. First, France had leagued against her Austria, Prussia, Sardinia and Naples, then Great Britain and Holland, and, later, Spain, Portugal, the Holy Roman empire, and (nominally) Russia. But her whole-hearted vigour and their discords and intrigues (turning chiefly on the partitions of Poland) finally discomfited their ill-concerted operations, until in 1794 the French *levée en masse* drove them back on all fronts, the British retiring on Holland. Meanwhile the British navy, hastily manned, had showed up poorly, but in 1794 under Lord Howe gained a notable success over slightly larger numbers on the "Glorious First of June." Lord Hood with the Mediterranean fleet, though driven from Toulon at the close of 1793, yet in 1794, with the help of Captain Nelson, captured three French strongholds in Corsica. After Hood's recall by Earl Spencer, the Mediterranean campaign of 1795 dragged on ineffectively, while in the following winter the French drove back into Hanover the duke of York's army, and forced the Dutch Republic to accept a French alliance.

The Second Phase.—The defection of Prussia and Spain soon following, the war entered on a second phase (Aug., 1795–Oct., 1797). England and Austria struggled ever more unsuccessfully against the French arms, directed by Carnot, the "organizer of victory," and thrust home by its executant, Bonaparte. The French invasion of Italy was favoured by Hotham's ineffective handling of our Mediterranean fleet, which, owing to the hostility of the Spaniards, abandoned Corsica and that sea at the end of 1796. Accordingly, in 1797, Bonaparte compelled first Naples then Austria to make peace. Thereafter Great Britain, with slight help from Portugal, bore the brunt of the war. Republicanism in the large towns, and annoyance at the inefficient handling of the campaigns (especially the diffuse and costly operations in the West Indies), had by this time aroused wide-spread discontent. The New Whigs urged parliamentary reform, which was loudly demanded by great mass meetings and Radical clubs. Pitt and his mechanical majority, reinforced by the Old Whigs, thereupon passed repressive measures, and prosecuted, often unsuccessfully, Tooke, Hardy and other Radicals. Thus the war rent asunder the party of reform, whose pacifist and Francophile left wing was now dubbed unpatriotic. Yet the intensity of the crisis in 1797 helped to stay national disintegration. First, in February the drain of the war compelled the Bank of England to stop cash payments and placed credit on a paper basis for some 20 years. Then, in succession the seamen of the Channel and Nore fleets mutinied for higher pay, the latter blockading the Thames until sheer rascality brought about successful retaliation, but not before consols had sunk to 48½. Next, Pitt's untimely overtures for peace with France met with a condign rebuff from the new extremist and aggressive Directory thrust into power by Bonaparte (September).

The Third Phase.—Insult, added to peril, now stiffened Pitt's attitude and that of the nation at large. In the third phase (Oct. 1797–Oct. 1801) all but the wilfully blind saw that the French no longer warred for the liberty of mankind but for their own colonial and commercial domination. Bonaparte's new oriental policy speedily led to the spoliation of the central Swiss cantons and of Rome, the seizure of Malta and the capture of Egypt. The triumph of Nelson at the Nile (Aug. 1, 1798), the capture of Minorca (1798) and Malta (1800) checked his designs and assured the safety of the overland route to the East. Indeed, so far back as 1795, the occupation of Cape Town and the Dutch settlements in Ceylon (due to the foresight of Henry Dundas) had placed the maritime keys of the Orient in British hands. Bonaparte's dream of eastern conquests came to him three years too late, and he was supremely lucky to escape from Egypt to France just in time to be greeted as "conqueror of the East." That illusory title and the far more valid hope of attaining glory and order under his rule enabled him to expel the Directory and make himself first consul (Nov. 1799). Pitt, however, refused to treat seriously a New Year offer of peace; for he hoped to breathe life into the second coalition of England, Austria, Russia and Naples; but Austro-Russian discords and the blows of Bonaparte and Moreau soon sapped its vitality, and it collapsed in the winter of 1800–1.

Meanwhile the Irish malcontents had acted as cat's paws for the French directory, which early in 1798 had fomented a rising with the futile hope of detaining the British fleet in home waters; but the Irish rebellion broke out in May and was sharply repressed before even a small French force arrived. In 1799–1800, however, the presence of a great Franco-Spanish fleet at Brest encouraged the malcontents, but also strengthened the arguments of Pitt, Grenville, Castlereagh and Cornwallis in favour of a parliamentary union, which resulted in 1800 by the use of methods of influencing votes far from uncommon in the Irish parliament. The union was a war measure, concentrating power in one central authority as was then happening in France in the hands of the first consul. (*See* IRELAND: *History*.) The sequel was curious. Pitt and most of his colleagues resolved to link with the union a measure for catholic emancipation which indeed the viceroy, Cornwallis, secretly promised to some leading Irish catholics. The king, however, on hearing of this project, declaimed against it so violently that Pitt and a majority of the cabinet resigned.

Another fit of royal lunacy supervened, and during the tardy recovery Pitt weakly promised not to bring up the question again in that reign. He also felt bound informally to help the next prime minister, Henry Addington, whose weakness disgusted most Pittites. Consequently the national party, formerly cemented by Bonaparte's aggressiveness, now went to pieces. Nevertheless, the war ended not unfavourably. The armed neutrality of the league of the Baltic Powers, trumped up against England by Bonaparte and his new friend the Tsar Paul, was shattered by Nelson's victory at Copenhagen and the assassination of the tsar. The expulsion of the French from Egypt further conducing to a general stalemate, negotiations for peace led to the signing of the Preliminaries of London on Oct. 1, 1801.

The resulting Treaty of Amiens (March, 1802) was unsatisfactory; for England, though supreme at sea, restored all the conquered enemy colonies, retaining only Trinidad from Spain and the Dutch posts in Ceylon. Yet France kept nearly all her continental conquests along with virtual control over the cordon of republics on the east. England evacuated Minorca, Egypt and the Cape, and reinstated the Knights of St. John at Malta on terms which proved unworkable. The situation became unbearable when Bonaparte intervened in the affairs of Holland, Switzerland and Italy, annexed Elba, and showed his resolve to conquer Egypt and regain the Ionian isles. Addington thereupon demanded the retention of Malta for ten years, and the rupture occurred in May, 1803. His manifest unfitness for so uphill a struggle led to the return of Pitt to power in May, 1804, when Napoleon became emperor of the French.

The Fourth Phase.—Owing to the retrocession of the French colonies England's position was less favourable than in 1801, but she defied Napoleon's efforts at invasion, tried to organize an efficient army, improved the militia and volunteers, and swept the seas by fleets which Earl St. Vincent had improved and Lord Barham now perfected. Napoleon's overbearing treatment of neutrals and annexation of Genoa having enraged the emperors of Austria and Russia, Pitt was able to form the third coalition against France. It was stricken to death by those Napoleonic masterpieces, Ulm and Austerlitz; but the coalition strategy, though faultily diffuse, achieved one great success; Pitt and the Tsar Alexander having sent forces to rescue south Italy, Napoleon ordered to the Mediterranean the Franco-Spanish fleet refitting at Cadiz. The result was Trafalgar, which averted French domination in that sea and enabled Britain to hold both Sicily and Malta, *barrière infranchissable* as Napoleon termed it, against his eastern designs. Thus Pitt and Nelson by their last efforts assured ultimate victory; for Napoleon, while conquering in turn Austria, Prussia and Russia, lost command of the sea and never realized the eastern plans dearest to his heart.

After Pitt's death a "broad bottom" ministry, nicknamed "of all the Talents," diverted British efforts to the Dardanelles, Rosetta and Monte Video with infelicitous results. Successful in abolishing the slave trade in British vessels, it failed to come to terms with Napoleon in 1806, and his "insincerity" in these negotiations probably hastened the end of Fox. In March, 1807, when Portland and Canning took up the reins, the nation supported them even in so reprehensible an act as their seizure of the neutral Danish fleet by way of retort to Napoleon's open bid for world supremacy at Tilsit (July–Aug., 1807).

The Fifth Phase.—Napoleon's secret bargain at Tilsit with Alexander for the partition of Turkey led him on into the Spanish adventure of 1808, which turned the Iberian peoples into bitter enemies and furnished England at last with a sure continental fulcrum for her army. The Anglo-Portuguese-Spanish efforts in the campaigns of 1808–13, backed by the prudent and untiring genius of Wellington, brought salvation to the three peoples and the hope of deliverance to Europe. The British navy not only carried without fail to the Iron Duke the needed supplies and reinforcements, but also threatened the French coasts and wore down the commerce and finances of Napoleon's empire. His immense expansion of that organism in order to bar out British goods from the Continent never fully achieved that purpose; for after Trafalgar the sea power won the Cape of Good Hope and most of the French and Dutch colonies, thus giving British trade a virtual monopoly of all tropical produce. Thereafter, the manufactured products were smuggled into his dominions through vantage points such as Anholt, Heligoland, the Channel Islands, the Iberian ports, Sicily and the Ionian islands. Thus his continental system, devised for the ruin of British trade, was ever being punctured, though hermetical sealing was essential for success. Great Britain's resources were seriously strained in 1810–11; and her Orders in Council brought about the lamentable war with the United States (1812–14); but the yet severer pressure of Napoleon's fiscal decrees led at that time to his rupture with Russia and the tragedy of the Moscow campaign. Thus his methods led to campaigns brilliant though barren; hers, to conquests of new lands fraught with infinite promise. The contrast explains the future shrinkage of the French people and the expansion of the British people.

1813–15.—It is impossible to describe here the closing phases of this mighty struggle; but, as the movements of great peoples register the verdict of history, we may note that, whereas in 1803–05 Great Britain was isolated, in 1813–15 the other Great Powers espoused her cause against Napoleon and assured his overthrow. To this result Wellington had materially contributed by his six peninsular campaigns even more than at Waterloo, for in them (to quote Napier) he won 19 pitched battles, made or sustained ten sieges, took four great fortresses, twice expelled the French from Portugal, and killed, wounded, and took prisoners 200,000 enemies. With uncertain help from Britain's difficult Spanish and Portuguese allies, he baffled the best of the French marshals at the head of veteran armies, and finally drove them over the Pyrenees, beating them at Orthez and Toulouse.

In his appeal to the prince regent[1] Napoleon termed the British "the most powerful, the most consistent and the most generous of his enemies"; and in the negotiations leading to the Peace of Paris, Castlereagh and Wellington sought successfully, with help from Alexander I., to prevent the partition of France by the Germanic Powers. Consequently she was restricted to her old boundaries in Europe, but recovered all of the British naval conquests except St. Lucia, Tobago, Mauritius and the Seychelles. Of her Dutch conquests England restored Java and other East India isles, but retained the Cape, Demerara and Curaçao, paying to the new kingdom of the United Netherlands as indemnity a sum not exceeding £5,000,000. In Europe the strategic points, Malta, the Ionian isles and Heligoland were also retained. Thus, while the heart of the British empire was protected by the allocation of the Flemish and Belgic lands to the now friendly Dutch, its outlying portions were safeguarded by naval bases, the importance of which had appeared in hostile designs and actions. (*See* also EUROPE: *History;* PENINSULAR WAR; NAPOLEONIC CAMPAIGNS; WATERLOO CAMPAIGN; NAPOLEON; GEORGE III.)

The economic features of the war are remarkable. Thanks to the factory system and Pitt's sound finance the revenue of the United Kingdom rose from £18,900,630 in 1792 to £33,069,775 in 1800 and £71,900,005 in 1815. Textile and hardware manufactures showed almost uninterrupted increases, as also the tonnage of ships clearing outwards. The population of England and Wales grew from about 8,760,000 in 1790 to 8,892,536 in 1801 (first census) and 10,164,256 in 1811. Yet improved agriculture and stock-breeding (largely due to Arthur Young, Bakewell and others) met these growing needs except after bad harvests. Thus the national vitality, shielded by the navy, defied Napoleon's efforts at commercial strangulation, carried on a costly war and met the financial demands of exigent allies.

THE REFORM MOVEMENT

Social Conditions.—War, however successful, leaves behind a rank seed-bed of discontent; for its rewards and penalties are in general brutally unjust. Discharges of sailors and soldiers (some 4,000 were helped out to Grahamstown in 1819–20) and the collapse of war industries and prices worked havoc with a social system already tottering to a great change, and now bowed down under unheard-of burdens. The war had raised the National

[1]Issued off Rochefort in July 1815.

Debt to £861,000,000 entailing the annual charge of £32,645,000. High taxes, bankruptcies and falling wages caused widespread discontent, which was accentuated by the repressive legislation of the Liverpool cabinet and the unpopularity of the prince regent. In fact Britain, which had deposed the imperial heir of the French revolution, now had to grapple with the outcome of her own industrial revolution. For during these twenty-one years of war the wonder-working inventions of Arkwright, Watt, Trevithick and Stephenson were multiplying steam-factories and laying out the first primitive railways—a change which drew population towards the coal fields. There these new amorphous groups, at the mercy of masters as hard as themselves, formed political gobbets indigestible by the old Georgian England. The discontent of the working classes during the war having largely ranged them with the Jacobins, the Pitt ministry in 1799 had suppressed all combinations of wage-earners. Trade unions being illegal, dissatisfaction with low wages and bad housing conditions took a threatening turn, as was seen in the Luddite Riots (*see* LUDDITES) of 1810–1811 and many outbreaks after the peace.

The schism between the new industrial England and the old agricultural England now yawned deep. For in 1815 farmers who during five years had waxed fat on wheat at an average of 100 shillings the quarter, had to face a drop to 63 shillings. The parliament of landlords, seeking to "save the farmer," imposed the Corn Law of 1815 excluding foreign corn until home grown corn reached the average of 80 shillings the quarter. The income tax of two shillings in the £ also gave place in 1816 to duties on very many articles which raised prices out of all proportion. Wages ruling low, there were numerous riots, the worst being the affair called Peterloo (*q.v.*) on the outskirts of Manchester (1819), when, at a meeting on behalf of parliamentary reform, the magistrates, in a fit of nervousness, let the Cheshire yeomanry charge, a dozen persons being killed and hundreds injured in the stampede. Rick burning in the country and machine breaking in the factories being rife, the Liverpool ministry, with Wellington and lords Sidmouth and Castlereagh as leading spirits, passed the repressive "Six Acts" (1819), which incited the extreme Radicals to the futile Cato street plot for the murder of ministers (1820). Knowledge now came under the official ban. The work of Bell and Lancaster in the new National schools and British schools being deemed dangerous, education was discouraged, and pamphlets and newspapers were subjected to a tax of fourpence a copy. The result was to favour the growth of the "unstamped press," secretly printed and circulated by Hetherington, Lovett and other working-men Radicals. And while the base of the social structure heaved with discontent the scandals of George IV.'s life and in 1820–21 his vulgar feud with Queen Caroline threatened to blow off the apex. Revolution, however, was averted both by the good sense of the mass of the people and by the slow but steady improvement of industrial conditions. Despite the financial vagaries of Vansittart, chancellor of the exchequer down to 1823, the Liverpool administration (1812–27) paid off much war-debt, reduced its rate of interest, resumed cash payments at banks in 1821–23, and was then able to remit some £3,500,000 in taxation. Huskisson, as president of the Board of Trade, reformed the navigation laws, lessened the duties on silks and sought to give effect to free trade principles. Nevertheless, Liverpool and his colleagues still opposed parliamentary reform, though the changing conditions of English life rendered the old system increasingly anomalous, and aroused general discontent, stridently voiced by the ablest of English pamphleteers, William Cobbett, and by several agitators.

Canning.—On a higher plane was British foreign policy, ably conducted by Castlereagh. He, the cementer of the European alliance against Napoleon, now steadily and in the main successfully opposed the monarchical reaction symbolized in the Holy Alliance (*q.v.*) and manipulated by Metternich. Thus throughout the period of the Congresses (1818–22) Britain exercised a moderating influence detested by the autocrats. After his suicide (1822), his rival and successor, Canning, imparted an even more progressive trend to foreign policy. Acute friction with France ensued in 1823 owing to her invasion of Spain on behalf of the Spanish autocrat Ferdinand VII., and her designs on Spanish America, then freeing itself from the mother-land. By way of counterpoise Canning proposed joint action with the United States. Unfortunately, President Monroe declined it, but issued the message, termed the Monroe Doctrine (*q.v.*), warning off the Continental Powers from the New World. Canning also recognized the independence of the Spanish American colonies on Dec. 31, 1824; and both they and the reactionary monarchs recognized in Britain's naval supremacy the decisive factor in the situation. Their rage was vented less on Monroe than on Canning; and he declared with no less justice than pride: "I called the New World into existence to redress the balance of the Old." In the sequel he was able to counteract reaction both in Iberian affairs and by assuring the independence of Brazil, before he turned to grapple with the "eternal" Eastern question (*q.v.*).

The Greeks, then almost beaten in their heroic struggle for independence, owe far more to Canning than they have generally realized. Though not claiming for them independence, which then seemed hopeless, he cautiously prepared the way for it, first, in 1823, by recognizing them as belligerents, next by sending to Constantinople as ambassador Stratford Canning with pro-Greek instructions, also by framing a close agreement with the new tsar, Nicholas I. After Canning became prime minister (April, 1827) this masterly orientation in British policy led to the Treaty of London (July 6, 1827) between Britain, Russia and France for imposing an armistice on Turks and Greeks with the ulterior aim of establishing Greek autonomy under the Sultan's suzerainty; failing which the three powers would interpose to prevent further hostilities. Before this last (secret) clause took effect Canning died (Aug. 8); but his last diplomatic action led to the joint pacific blockade of the Morea, which involved the Battle of Navarino (*q.v.*). More than any one man, Canning freed Greece.

Less progressive in home than in foreign affairs, Canning blocked the way to reform except in regard to Catholic emancipation, which, as a pupil of Pitt, he sought to further. Finally, Wellington as prime minister (1828–30) had reluctantly to concede this measure as needed to pacify Ireland, then roused to passion by O'Connell's indignant oratory. Despite the king's opposition and the no-popery cry, the bill passed both houses in March–April, 1829. Justice had been tardily done to Nonconformists in 1828 by the abolition of the Test and Corporation Acts (*see* TEST ACTS) on the motion of Lord John Russell.

Parliamentary Reform.—Meanwhile the disfranchisement of three of the most rotten boroughs, Grampound, Penryn and East Retford, showed that parliamentary reform could not long be staved off. That question had passed through the following phases—in 1780–84 constitutional growth, 1785–90 apathy, 1790–98 Gallophile effervescence, 1799–1815 apathy, 1815–29 revival under the impulse of material distress and the diatribes of Cobbett, etc. The quick shifting of population to the new industrial towns furnished an even more cogent argument against the old haphazard plan whereby many villages returned two members apiece and Cornwall sent up 44 members as against 45 from the whole of Scotland. The caprices of the old franchise being equally fantastic, Lord John Russell easily proved the need for a system which would be intelligible and national. Fortunately, the opportune death of George IV. now brought to the throne William IV.; and against the homely "sailor king" it was hard to get up a revolution. The general election of September, under the impulse of the democratic July revolution at Paris, sent up a majority favourable to Reform. Wellington, declaring in favour of the old system as the best that the wit of man could devise, was beaten; and the second Earl Grey formed a ministry, which, after two rejections by the House of Lords and fierce rioting by way of protest, carried its third Bill through that house on June 4, 1832.

That measure disfranchised 56 nomination boroughs, and halved the members from 30 more. In all 143 seats were left free for distribution and of these 65 were allotted to counties in England and Wales, which were to send 150 members, elected by the 40-shilling freeholders along with £10 copyholders and £50 leaseholders. Forty-three towns now became parliamentary boroughs, having a uniform £10 household suffrage in place of the old

chaotic franchises. Scotland now gained her due place in parliament. The power of the squires was lessened, for shop-keepers in the towns, and in the counties, landlords and farmers, now formed the majority of voters. The result disgusted not only the old Tories but also the Radical working-men, who complained that Grey and Russell had cheated them of power. Hence the Chartist movement of the near future.

Viewing the period as a whole, we see that the divergence and subsequent clash of the reform movements of England and France worked infinite harm on both peoples. Apathy, bred of contentment, hypnotized English reformers in 1785–89; just grievances, national excitability and a long series of political blunders worked up those of France to fury, with its sequel the Terror and war with England. That internecine conflict led France to an empire, England to reaction. Fear of the red spectre haunted the minds of Pitt's followers even up to 1827. Fox and his disciples saw more clearly that reform would strengthen the constitution; but their anti-national tirades during the war long clogged their efforts. Finally the slow but mighty uplift of the industrial revolution removed the war-incubus; and, by a curious stroke of irony, the Paris revolution of 1830 came to clinch the finale at Westminster. When the dust of conflict cleared, the Reform Bill of 1832 was seen to be truly conservative, and might indeed claim a lineal descent from Pitt's reforming efforts in 1783–85. (*See* also Reform Movement and the various biographical articles.) (J. H. Ro.)

XI. THE VICTORIAN AGE, 1832–1901

When the great Reform bill had sailed safely into port, leaving the storms of popular riot and constitutional crisis behind it, a new epoch had begun. That epoch may be said to end with the conquest of the Dutch Republics in South Africa, the death of Queen Victoria, and the end of the century, three events that came almost together. We call the age Victorian, for the Queen's reign covered all but five years of it. It was an age remarkably free, in England, from sudden revolutions and violent catastrophes such as France, Germany, Italy, and the United States experienced. None the less, in Britain quite as much as in those other countries, it was an age of unprecedentedly rapid change and development. The population of England and Wales rose from 14,000,000 to over 32,000,000, and wealth increased faster than population. Overseas trade was multiplied sixfold. The number of paupers in receipt of relief was reduced by one-third; the number of criminals in prison was halved. Railways were a novelty and an experiment in 1832; in 1901 the novelty was the motor-car. In 1832 the tonnage of vessels served by steam was less than 100,000 tons; in 1901 it was 13,700,000 tons, more than four times the total mercantile tonnage of the country at the earlier date. In 1832 electricity had no commercial uses; in 1901 electric light, telegraphy, and traction were all taken for granted.

The great Reform Bill had extended the electorate, but even so there were less than a million voters in the whole country; it was a middle-class electorate. By 1901 the control of the government belonged to the wage-earning males. In 1832 only about a quarter of the children of England and Wales received any school education; in 1901 education was compulsory and free of charge. In 1832 there was a four-penny tax on newspapers. The taxed and legal newspapers catered only for an educated and prosperous class, and the untaxed and illegal papers led a precarious and generally disreputable existence. By 1901 the half-penny *Daily Mail* had a circulation of a million copies. In 1832 trade unions had only been legalized eight years before, and their membership was probably well under 100,000. In 1901 there were close on two million trade unionists, and the Labour members had sat in the House of Commons.

If we turn to Britain overseas we find that, in 1832, Canada consisted of two small colonies, soon to be in rebellion against the government provided for them; Australia was still used as a place for convict settlements; New Zealand was not yet British territory; Cape Colony was rent by the Anglo-Dutch rivalries which resulted soon after in the Great Trek, the exodus of the discontented Dutch to found new communities north of the Orange and the Vaal rivers. By 1901 that quarrel had reached its climax in the South African War, and troops from the other three "colonies," by that time self-governing dominions, were voluntarily assisting the mother-country in the South African War. The British population in the dominions, a mere handful in 1832, was by 1901 nearly equal to the population of England and Wales at the earlier date.

THE WHIGS AND THE CHARTISTS, 1832–41

During the agitations attending the passage of the Reform bill some had feared and others had hoped that the character of the House of Commons would be henceforth radically different. These hopes and fears proved groundless. The new House and its successors for the next forty or fifty years were much like the Houses of the years immediately before the Reform. Country gentlemen predominated, and the proportion of self-made business men and lawyers increased but slowly. Cabinets, especially Whig cabinets, continued to be recruited mainly from the old aristocratic families. The new voters proved, as Bagehot remarked 35 years later, to be "deferential"; they preferred to be represented by their "betters."

The Whigs secured a big majority in the first election on the new franchise, and Lord Grey's cabinet kept in office. Its first important measure was the Abolition of Slavery (1833), an Act which completed the good work begun by the Abolition of the Slave Trade Act in 1807. These measures are the first notable example in our history of the power of a great voluntary organization, the Anti-Slavery Society, working to stir public opinion and thus to secure parliamentary action. It is also remarkable as the work of the great evangelical religious movement, whose origins can be traced back to the preaching of Wesley and Whitefield. The slave-owners received £20,000,000 in compensation, but the change inevitably produced grave complications in South Africa and the West Indies. (*See* Wilberforce, William; British Empire.)

The principal measure of 1834 was inspired not by philanthropy but economy, namely the Poor Law Amendment Act, which brought to an end the reckless distribution of outdoor relief which had grown up in the previous forty years. The aim of the new Act was to abolish outdoor relief entirely. It inflicted great misery on the poorest folk, and no government depending on a democratic franchise would have dared to introduce it; none the less, it terminated an intolerable misuse of ratepayers' money.

In the same year Lord Melbourne, who had succeeded Grey as Prime Minister, being in difficulties with his cabinet, secured his own dismissal by King William IV. Peel took office, and dissolved parliament; but the election gave the Whigs another, though reduced, majority, and Melbourne returned to office. The episode had enabled Peel in his "Tamworth manifesto" to proclaim that his party, henceforth not Tory but Conservative, frankly accepted the Reform bill as final, and proposed to enact its logical consequence, namely, a reform of the system by which town councils were elected. Henceforth these were to be elected by the whole body of the ratepayers. This measure was actually carried by the Whigs on their return to office (1835). But it is remarkable that country areas remained under the government of nominated magistrates for another half-century.

Queen Victoria.—The year 1837 saw the accession of Victoria, and Melbourne is best remembered to-day as the wise and kindly old statesman who gave the young queen her political education. That education was to be continued by Prince Albert of Saxe-Coburg, who became the queen's husband in 1840. In 1839 Victoria's devotion to Melbourne occasioned a somewhat ludicrous political crisis. Melbourne resigned office, having practically lost his majority in the Commons, and the queen sent for Peel, who, however, declared that he could not form a government unless the queen would consent to dismiss some of the Whig ladies of her household and receive Tory ladies in their places. The queen refused, and Melbourne consented to resume the office he had laid down. After her marriage the queen attached less importance to these ladies, and no further "Bedchamber questions" arose.

Two important innovations marked the year 1839. One was

the establishment of the penny postal service, a corollary of the railway system now rapidly developing. In this matter England led the world. In the matter of elementary education, on the other hand, she took, in the words of a great French historian, "the lowest place among Protestant countries." Since the early years of the century organizations affiliated to the Church of England and the nonconformist churches had been establishing elementary schools in increasing numbers. In 1838 the Government made an annual grant of £20,000 to these organizations. In 1839 the grant was increased to £30,000, and a committee and inspectors appointed to supervise the expenditure of the grant. Here was the beginning of what has grown into the Board of Education.

Chartism and the Anti-Corn Law League.—Industrial enthusiasts, such as Ure, in his *Philosophy of Manufactures* (1835), gloried in the strict discipline enforced by factory conditions, but the factory workers themselves took a different view. The new Poor Law was another exhibition of "discipline" and was equally unpopular. The masses whose formidable enthusiasm had helped to carry a middle-class Reform bill, were already beginning to ask themselves "what next?" In 1834 Robert Owen (*q.v.*), once the "model employer" of New Lanark and afterwards the evangelist of other doctrines, co-operative, socialist and secularist, organized a Grand National Consolidated Trades Union which should secure the establishment of some vaguely defined socialistic system by means of a General Strike. A merciless government prosecution of seven Dorchester labourers pricked the bubble of Owenism, but Chartism (*q.v.*) stepped into its place. The "People's Charter," published in May 1838, demanded manhood suffrage, vote by ballot, payment of members, abolition of the property qualification for members, equal constituencies, and annual parliaments. But the movement behind this programme lacked capable leaders, and such leaders as it had were hopelessly divided in method. Did the Chartists intend simply to present a petition to parliament, or to overawe parliament, or to deny the legitimacy of parliament, as a non-democratic assembly? As so often happens with such movements, the extremists were the most vocal section, and in consequence both trade unionists and radical politicians drifted out of the movement. Mild riots at Birmingham and Newport ended the Chartism of the 'thirties. Chartism was the typical working-class movement of the day, and its ineffectiveness illustrates the fact that the working-classes had not discovered either a satisfactory programme or an effective method of mobilising their power. A different destiny awaited the Anti-Corn Law League, founded in conscious rivalry with Chartism, by Radical M.Ps. and Lancashire manufacturers in 1836. The League sought to persuade the working man that his principle grievance was neither his exclusion from political life nor his inclusion in the factory system but the dearness of his food, due to Corn Laws made by landlords for the benefit of landlords.

But it would be a mistake to regard political agitation as the most characteristic feature of early Victorian England. If we had to select one such feature we should select the domination of all classes and all Protestant churches by evangelical piety. What we loosely call "Victorianism" is in fact the triumph of the evangelical movement.

The Fall of the Whigs.—Melbourne's government, like so many other British governments, was continuously embarrassed by Irish problems—Irish tithe, Irish Poor Law, and Irish local government. Canada and Jamaica were also the subjects of stormy debates. The Canadian rebellions of 1837 (*See* CANADA: *History*) led to the mission of Lord Durham (*q.v.*), whose famous Report led to the establishment of Canadian self-government, a system extended in due course to all the other "White" colonies. In Jamaica, on the other hand, where the population is predominantly "Black," the Government sought to terminate the system by which a handful of British planters governed the island. They failed, and this system lasted until 1865. But the chief weakness of the Whigs was that they lacked a bold and competent financier. Baring's Budgets of 1838–41 were all unsuccessful measures, and the last of these Budgets involved the fall of the Government. The election of 1841 gave the Conservatives a safe majority, and Sir Robert Peel became prime minister.

The Melbourne government had on the whole a poor record, but non-political England was hard at work. Railways, steamships, factories went ahead. The ten years under review mark an important epoch in the history of banking. Joint Stock Banks had been legalized in 1826, and in 1833 were allowed to establish themselves in London, where the Bank of England had hitherto enjoyed a monopoly. The next few years saw the establishment of the Westminster, Union, and London and County Banks. It was proved that a bank could prosper even though it could not issue bank-notes; for this then much valued privilege was restricted to the Bank of England and to "provincial" banks with no branch within sixty miles of London.

Literature.—This period saw the appearance of the last novel of Scott and the first novels of Dickens. Wordsworth was growing old and had long passed his prime, but Tennyson's early poems were beginning to attract attention, and Macready, the actor, enabled Browning to hold the stage (for a few days only) with his historical drama of *Strafford.* Macaulay's essays were eagerly read in the quarterly issues of the *Edinburgh Review,* and Carlyle's *French Revolution* not only showed that the French Revolution was neither as black nor as white as enemies and friends had painted it, but also indicated what happened to governments which disregarded the aspirations of their voteless masses. Lyell's *Principles of Geology* opened up new views of the history of the animal creation, and prepared the way for the violent Victorian controversies between religion and science.

FREE TRADE, 1841–52

Peel.—Peel's first duty was to secure a revenue equal to the expenses of the government, a task in which the Whigs had lamentably failed. His famous Budget of 1842, introduced by the prime minister himself, established an income-tax of sevenpence in the pound. Pitt's income-tax had been explicitly a war measure, and had been dropped in 1815. Peel's was put forward as an emergency measure, but it has proved a permanency. This budget and those of 1845 and 1846, all three of which either abolished or drastically reduced hundreds of import and export duties, mark the substantial establishment of free trade, and of our modern system of taxation. They coincided with the turn of the tide of national prosperity. The "hungry forties" were the early forties, a time of distress quite as bad as any of the years immediately after Waterloo. Now at last the tide of mid-Victorian prosperity set in. In 1844 Peel was able to reduce the interest on nearly a third of the national debt from 3½ to 3¼ per cent., and in 1845 his Bank Charter Act reformed the functions of the Bank of England.

Repeal of the Corn Laws.—Ireland was, as usual, a cause of embarrassment. Peel showed sympathy by increasing the government grant to the Irish Roman Catholic College of Maynooth, but this was a small matter compared with the appalling famine of 1845, occasioned by the failure of the potato crop, the staple food of an already impoverished and overpopulated island. (The population of Ireland was 8,000,000, twice what it was in 1926). In the same year rain destroyed the English harvest. Ireland was starving and England could not feed her. Cobden, the lucid advocate of the Anti-Corn Law League in the House of Commons, had already converted Peel to the policy of applying his free trade system to corn, but his electoral promises pledged him to maintain the Corn Law. He had intended to announce his conversion at the next election but Ireland forced his hand. He resigned. The Whigs, led by Lord John Russell, failed to avail themselves of the opportunity to form a "repeal" government, and Peel resumed office and carried the measure (1846). But the triumph of his policy was the ruin of his party. Landlords predominated on the benches behind him, and they had never wholly trusted Peel, himself the son of a manufacturer and a "Conservative" (whatever that might mean) rather than a genuine "Tory." They found leaders in Lord Stanley (subsequently Derby), Lord George Bentinck, and Disraeli, who attacked Peel night after night with the wittiest invective ever heard in the House of Commons. The rebels and the Whigs combined to defeat Peel on the very night on which his "repeal" measure was reluctantly piloted by the Duke of Welling-

ton through a reluctant House of Lords. Henceforth the rebel Tories were the Tory Party, and the faithful became known as the Peelites, a distinguished but diminishing "third party," of whom one was Gladstone. (*See* CORN LAWS.)

Factory Acts.—The Russell Government (1846–52) was undistinguished in domestic policy and unsuccessful in its well-meant efforts to alleviate distress in Ireland, where eviction of bankrupt tenants and emigration to America assumed gigantic proportions. Two important measures mark these years. The repeal of the Navigation acts (1849) administered a further dose of free trade (for the Acts restricted British commerce to British ships), and ended a system as old as the Commonwealth, and in principle older. The other important measure, the Factory Act of 1847, owed nothing to the favour of the government, but crowned the labours of a lonely, austere philanthropist, Ashley (subsequently Lord Shaftesbury), who, so far as he was a party man at all, was a high Tory. Ashley's first Factory Act (1833) had failed from lack of factory inspectors. His Mines Act of 1842 had prohibited the underground labour of women of all ages and of boys under ten. The act of 1847 prohibited factory labour for women and for lads under 18 for more than ten hours a day. In practice factory convenience generally extended the same privilege to men. These reforms were carried in the teeth of the intellectual convictions of the politicians of both parties; for all orthodox politicians at that date favoured "freedom," *laissez-faire*, non-interference, in all departments of industry. But there were landlords who were glad to get their revenge on the manufacturers who had secured the abolition of the Corn law; and there were also the appalling facts about child-life revealed by the official enquiries preceding these acts. Ashley, in securing government commissions of enquiry, forced the facts into the daylight, and the facts were eloquent. The age of statistics was beginning.

Palmerston.—Palmerston, the Whig foreign minister, enlivened politics, embarrassed his colleagues, and gradually established his position as the most popular statesman since Pitt. In the Grey-Melbourne governments he had powerfully assisted the liberation of Belgium from union with Holland and the extrication of Turkey from the clutches of Mehemet Ali, the ambitious Khedive of Egypt. He now quarrelled (on good grounds) with Louis Philippe, thus hastening the downfall of that insecure monarch, and sent a naval squadron to Athens to support the (mainly fraudulent) claims of a British Jew named Don Pacifico. The occasion was trivial, but Palmerston's triumphant vindication of a policy of supporting British subjects against foreign oppression in every quarter of the globe was a sign of the times. The bellicosity of the Crimean War was approaching. "Old Pam's" policy was his own, and took little account of the wishes either of his colleagues or of the queen, now the ardent pupil of her husband, who was himself a specialist in foreign affairs. Palmerston made a false, because unpopular, move when he congratulated Prince Napoleon on his *coup d'état* at the end of 1851, and was dismissed, but he scored his "tit for tat," as he called it, by securing Russell's defeat in the next year. The brief Government of Lord Derby (1852) which followed was made notable by two facts. It brought Disraeli into high office, and led to the explicit abandonment of protection by the nominally protectionist party. It was defeated on Disraeli's Budget and succeeded by a coalition of Whigs and Peelites under the Peelite Lord Aberdeen.

Prosperity and Co-operation.—The eleven years 1841–52 witnessed an important transformation in the world of labour. They opened with the "hungry forties" and ended with two years each of which was described by the *Times* as "of unexampled prosperity." It was in response to this change of conditions that working-class leaders abandoned projects aimed at revolutionary change, and sought to organize working-class prosperity within the "capitalist system"—capitalism itself making reluctant advances towards humaner methods through the Factory Acts. The final explosion and fiasco of Chartism in the Kennington Common meeting of 1848 was sensational but unimportant. The more important events are less conspicuous. In 1846 the Rochdale Pioneers established a co-operative consumers' society, which proved its right to its self-chosen title of Equitable Pioneers. Its novelty was that instead of attempting the impossible task of selling at cost price, it sold at market price and returned profits to its customers in "dividend," this being often left to accumulate as share capital. Co-operative production was more hazardous and less successful. The same year, 1846, saw the establishment of the Registry of Friendly Societies, and the Permanent Building Society to enable the thrifty to buy their own houses.

When Owen's unseaworthy Grand National Consolidated Trades Union suffered shipwreck in 1834, many small local "craft" unions were formed from among its disappointed members, and these subsequently found strength in amalgamation. The model of such was the Amalgamated Society of Engineers (1851), providing for strikes, unemployment, sickness, and superannuation. It fought and lost, with much public sympathy and assistance, a notable three months' strike in 1852.

Newman and Arnold.—Peel's conversion to free trade in corn created scarcely more excitement than John Henry Newman's conversion to Roman Catholicism in the previous year. The celebrity of this event is not so much evidence of the greatness of Newman as of the fact that the Early Victorian was essentially a theological age. The Oxford Movement, in which Newman had been a leader, seemed to have ended, but it was in fact entering a wider world as the Anglo-Catholic movement. Among its by-products was a renewed interest in and respect for the Middle Ages, which also found expression in Carlyle's *Past and Present* (1842). The first volume of Ruskin's *Modern Painters* appeared in the following year, and Victorian Gothic in all its strange varieties was soon to adapt itself to churches, hospitals and railway stations. Another churchman as notable as Newman was Thomas Arnold, the great headmaster of Rugby, who died in 1842. Henceforth the public schools were to be transformed into centres of earnest endeavour and manly decorum, and the growth of railways was to multiply many times over the public which made use of them. One of Arnold's pupils, Thomas Hughes, author of *Tom Brown's Schooldays*, was, with F. D. Maurice and Charles Kingsley, a leader of the little group of churchmen who, with bold defiance of popular prejudice, called themselves "Christian Socialists" (1848). The church, they held, had other work to do besides defining doctrines and saving souls at home, and converting the heathen abroad; it had to apply gospel standards to industrial organization and substitute co-operation for competition, and though these idealists failed, a bond was established between church and labour.

The Great Exhibition.—But "prosperity" rather than "problem" was the note sounded by the Great Exhibition of 1851, housed, in Hyde Park, in the Crystal Palace afterwards transferred to Sydenham. The event illustrated the fact that the Prince Consort, while fighting a losing battle for the control of purely political issues, was discovering a new career for royalty as the representative of the nation in matters which the parties agree to place above and beyond controversy. Free traders were inclined to regard the new prosperity as a product of free trade. Free trade played a part, but a greater part was played by the now essentially completed system of main-line railways. Hitherto old-world transport had stifled the output of steam production: steam transport enabled steam production to go full-steam ahead. That the demand of the consumer might some day prove unequal to absorbing the supply of the producer was not foreseen; and excusably, for it was a problem of the 20th century.

THE PALMERSTONIAN AGE, 1852-65

When Lord Palmerston, grudgingly supported by his colleagues, had won his strange personal triumph in the Don Pacifico debate of 1850, the Palmerstonian age had begun. Its hero was already 65 and could look back on an official career which began in 1809; but fifteen years of life remained to him, during which he dominated politics and gave a character all his own to our history. It was a curious interlude in the Victorian Age, a time of steady prosperity and domestic quietude, when John Bull took his ease, and enjoyed (or criticized) the adventures of a statesman who, whatever his faults, was proud of his country and determined that she should play a great and worthy part in the affairs of the

world. That is not, of course, the whole story of these fifteen years, but it is the main story. The first two years of it have been included in the previous section.

Aberdeen's coalition (Whig and Peelite) government had Gladstone as its chancellor of the exchequer, and the first of his long series of Budgets (1853) carried on Peel's financial policy. The income-tax was extended and more import duties abolished; the tax on spirits was increased and that on tea reduced. This promoted temperance, and another virtue reputed even nearer to godliness was promoted by the abolition of the tax on soap. But Gladstone budgeted for peace while his colleagues were "drifting" (to use Aberdeen's subsequent admission) into war.

The Crimean War.—The Crimean War (1854–56 *q.v.*) had both general and special causes. The general cause was the aggressive power of Russian despotism. Its south-eastern extension threatened Afghanistan, and its championship of Christian peoples in the Turkish Empire was considered a mere cloak to cover its lust for Constantinople; it was a bugbear to imperialists and an abomination to Liberals. Of the special causes, the chief was Lord Stratford de Redcliffe, British ambassador at Constantinople, who so manipulated controversies between Russia and Turkey as to provoke a Russo-Turkish war and to bring Great Britain into it on the Turkish side. Napoleon III., since 1852 emperor of the French, brought his reluctant country into the war in alliance with Great Britain. Aberdeen's government failed to control Lord Stratford, and Palmerston (imperfectly muzzled at the Home Office) had no desire that they should do so. The war proved, like other wars before and since, that bravery is much commoner than brains. It was the first war to be fully described in the daily press, and the revelations of Russell in the *Times* not only sent Florence Nightingale (*q.v.*) to Scutari, but also brought down the Aberdeen government; so Palmerston became prime minister (Jan. 1855). The British troops had greatly distinguished themselves at the Alma, Balaklava, and Inkerman in the autumn preceding the Crimean winter, but the capture of Sevastopol in Sept. 1855 was mainly the work of the French, whose forces by that time greatly outnumbered our own. The Treaty of Paris, which concluded the war, opened the Black Sea (*q.v.*) to the commerce of the world and closed it to vessels of war, forbidding the establishment of arsenals on its shores. For 15 years Russia accepted the neutralization of the Black Sea. In 1871, when France was at the feet of Bismarck, Gladstone's government was compelled to surrender the principal Crimean trophy, and Sevastopol rose again from its ruins.

In 1857 Palmerston allowed the British minister in China to involve Great Britain in a war over a petty dispute, and he was defeated on a vote of censure in the House of Commons, but he at once appealed to the constituencies and won the general election on this issue. Canton had already been bombarded; subsequently Lord Elgin occupied Pekin. But these events were quite overshadowed by the Mutiny of the Indian Sepoy regiments. Throughout the summer and autumn of 1857 all attention was concentrated upon the siege of Delhi, the tragedy of Cawnpore, and the defence and relief of Lucknow; and new names were added to the long roll of the heroes of the British army. (*See* INDIAN MUTINY.)

The Orsini Plot and Palmerston's Last Government.—In 1858 an Italian named Orsini attempted to assassinate Napoleon with bombs made in Birmingham. The French government despatched a rude remonstrance, and when Palmerston made the retort courteous of a bill increasing the penalties for conspiracy, the "patriotism" of which he had hitherto been the mouthpiece turned against him. He was defeated and succeeded by Derby, with Disraeli as leader in the Commons. The Derby government admitted Jews to parliament, terminated the existence of the East India Company, and incurred defeat over an attempt to extend the parliamentary franchise.

The general election of 1859 restored Palmerston to power, which he retained till his death, strengthened by the inclusion in his cabinet of the Peelite leaders, whose separate organization now came to an end. Gladstone returned to the Treasury and resumed the tale of his Budgets. A commercial treaty with France (1860), negotiated by Cobden, seemed to many the beginning of the conversion of the continental nations to free trade, and Gladstone's name, afterwards annexed by a bag, was temporarily attached to the cheap clarets made available by the treaty. Another item of 1860, the repeal of the paper duties, had an important constitutional consequence. The Lords rejected the bill in which it was embodied, and henceforth all the Budget measures of the year were included in a single Finance Bill. As the Lords could not, by custom, amend financial bills, they could henceforth interfere with taxation only by rejecting the whole of the revenue measures of the year, a course on which they did not venture till 1909.

The years of Palmerston's last government (1859–65) saw the union of modern Italy, the American civil war, and the Danish war with which Bismarck opened his momentous career as the maker of Prussianized Imperial Germany. To the Italian cause the government gave "moral support" which had a distinct though easily exaggerated value; but it is impossible to admire their part in the American and Danish crises. A peremptory despatch about the affair of the *Trent* (when an American naval officer improperly arrested the "Southern" envoys in a British ship) might have led to an unforgivable war had not the Prince Consort altered the document—the last public action of an admirable and unappreciated foreigner. As for the Danes, the British Government encouraged them to fight believing that Prussia would thereby be induced not to fight; but bluff was wasted on Bismarck, and Denmark paid the penalty.

It was a relatively quiet period in the world of labour, but among the miners and the builders trade unionism made a marked advance. In 1863 Alexander Macdonald succeeded in assembling, at Leeds, the first really representative Miners' Conference, and an organization to assist the building trade workers in the lockout of 1859 was a first foreshadowing of the national Trade Union Congress. During these years also a group of trade union secretaries resident in London became an informal clearinghouse for labour policies, and a means of establishing contact with friendly journalists and politicians: the group is commonly known as "the Junta." At about the same time Ruskin, who had secured the attention of a large public by his books on art and architecture, began to denounce in impassioned lectures the immorality of orthodox capitalist economics.

In 1859 the publication of Darwin's *Origin of Species* brought to a head the long pending controversy between "faith" and "science." Bishop Wilberforce disposed of the book as "atheistical" in the *Quarterly Review*, and was unwise enough to encounter Huxley in debate at the annual meeting of the British Association. Strong controversies arose within the church itself over *Essays and Reviews* (1860), a volume by several clerical hands, and Bishop Colenso's rationalistic examination of the Pentateuch (1862). The year of *The Origin of Species* (1859) also saw the publication of the first big novels by George Eliot and George Meredith. Almost all the poetry of Matthew Arnold belongs to the "Palmerstonian age," and its last year witnessed the publication of *Atalanta in Calydon*. Its author, Swinburne, was closely associated with the Pre-Raphaelite group of painters, whose theories and practice, whatever their merits, were about to stimulate a more vivid interest in the problems of pictorial art.

GLADSTONE AND DISRAELI, 1865-80

The Second Reform Bill.—Lord Russell became prime minister on the death of Palmerston, but it was plain that Gladstone would succeed to the leadership of the Whig-Liberal party in the near future, and that Lord Derby would similarly pass on the leadership of the Tory-Conservatives to Disraeli. The main motive of the politics of 1865–68 is the manoeuvring of Gladstone and Disraeli, in a House of Commons elected to support Lord Palmerston, for the succession to Palmerston's position as ruler of England. The principal by-product of these manoeuvres was the Second Reform Bill (1867) which doubled the electorate and gave the vote to the artisans in the borough constituencies, thus enfranchising the bulk of the factory workers but not the miners and agricultural labourers. Chartism had expired amid ridicule in 1848, but very soon after that date leading members of both

parties had begun to speculate upon an extension of the franchise, and various abortive bills had been introduced. Palmerston's indifference or dislike had postponed the issue, and his death immediately brought it within the range of practical politics. Russell and Gladstone introduced a moderate and colourless measure in 1866, which suffered serious amendment at the hands of the Conservatives and anti-Reform Liberals (nicknamed "Adullamites"), whereupon Russell's government resigned. Derby took office, and in 1867, after parting with three anti-Reform colleagues (one of them the future Lord Salisbury) carried an alternative Reform Bill, establishing "Household suffrage" in the boroughs, and lowering the franchise more guardedly in the county constituencies. The bill had been drastically amended in a democratic direction by Liberal proposals which Disraeli accepted and made his own, for both parties were bidding for the support of the new electorate. Lord Derby claimed that he had "educated his party," and "dished the Whigs." But the election had to be postponed till the new registers were ready, at the end of 1868. That year was marked by the activities of the Fenians, the new Irish physical force party, and Gladstone cleverly announced a policy of disestablishing the Irish Protestant Church. English electors hoped that this concession would abate the Irish nuisance, and Gladstone secured a majority of about a hundred. Of the next twelve years Gladstone had the first six.

Gladstone.—Gladstone's first Irish measure, the disestablishment and partial disendowment of the Irish Church, involved a conflict with the House of Lords, the most serious since the first Reform bill. The Lords accepted disestablishment but prepared to fight for the preservation of a larger fraction of the endowment. Gladstone, who never lost all his early Conservatism, worked hard and successfully for a compromise, actively supported by the queen. The next year (1870) witnessed the passing of an Irish Land Act designed to protect the tenant from "undue and unjust" eviction. It was ineffective, and its importance lay not in settling a very difficult problem but in indicating that the problem had got to be solved. In 1873 an unsuccessful attempt was made to provide an Irish University so constituted that British taxpayers would be willing to support it and Irish Catholic bishops to accept it. Ireland was not conciliated by any of these measures and "coercion" (*i.e.*, suspension of some of the normal privileges of British freedom) proved as inevitable under Gladstone's government as under nearly all other governments of the 19th century.

The principal legislative achievement of Gladstone's first government was the great Education Act of 1870. Its author, W. E. Forster, was a son-in-law of Dr. Arnold of Rugby and brother-in-law of the poet and essayist Matthew Arnold, whose long and unobtrusive career as a school inspector rendered valuable service to state-aided education. The government grant to "voluntary" schools (*i.e.*, schools established by the Church of England and other bodies) had steadily grown since its inception in 1833, and in 1870 about half the children of the country received some sort of elementary education. The Act of 1870 did not supersede this system, but filled in the gaps in it by erecting schools offering non-sectarian "simple Bible teaching," paid for out of local rates, and controlled by locally elected School Boards, which were empowered to make education compulsory in their localities. We may add here that elementary education was made compulsory throughout the country in 1880, and the small fees charged in many schools were abolished in 1891.

Among other measures of the 1868–74 government, Oxford and Cambridge degrees were thrown open to Dissenters, the civil service was thrown open to competitive examination, the army was reorganized by Cardwell and the system of purchasing commissions abolished, and the ballot was introduced for parliamentary elections. It may be doubted if this last measure was of much value in England; the time when it was needed had gone by, for voters had no longer cause to fear penalties at the hands of their employers. In Ireland, however, its effect was important and unforeseen. By releasing the Irish voter from the inquisition of his landlord it called into existence the Irish Nationalist party.

In the sphere of foreign policy Gladstone had been unable to prevent or to influence the course of the momentous Franco-German War (*q.v.*), though he secured from both parties an undertaking to respect the neutrality of Belgium. His concession to Russia of her right to rebuild Sevastopol as a naval base was a retreat, and retreats, even from untenable positions selected by one's predecessors, are never popular. Equally unpopular, though eminently wise, was his treatment of the *Alabama* question. The *Alabama* had been a privateer of the rebel Southern States of U.S.A., equipped in the Mersey, and allowed to leave British waters by the negligence of Palmerston's government. American demands for compensation were somewhat insulting in tone, and the controversy had long dragged. Gladstone got the matter referred to an international tribunal and paid the damages awarded. It was an important precedent for the use of arbitration in international disputes. (*See* "ALABAMA" ARBITRATION.)

Disraeli.—A cascade of political reforms is apt to terminate "gratitude for favours to come" and to offend those whom the reforms either irritate or disappoint. Disraeli expressed the sentiments of many when he accused his rivals of "plundering and blundering" and apostrophised the Treasury bench as a "range of exhausted volcanoes." His party secured a sound majority in the election of 1874. The new prime minister (soon to go to the House of Lords as earl of Beaconsfield) had described his policy as "the maintenance of our institutions, the preservation of our empire, and the improvement of the condition of the people." The third of these promises took shape in an Artisans' Dwellings Act, an important new departure in that it called in local public authorities to remedy the defects of unscrupulous private enterprise in housing. There was also an important Trade Union act, to be dealt with below. But for the greater part of its existence the energies of the government were monopolised by a series of foreign and imperial ventures.

The first and most formidable of these was the Balkan crisis of 1875-78. This was the first general nationalist rising of the Balkan peoples against Turkish rule. Russia, whose championship of distressed Balkan peoples was never very clearly distinguishable from imperialist ambition, went to war with Turkey (1877) and her armies advanced up to the defences of Constantinople. Gladstone supported the Balkan peoples on Liberal and moral grounds and looked forward to the expulsion of the Turk "bag and baggage" from the provinces he had misruled. Beaconsfield championed the Turkish Empire as a first line of defence of the British Empire in India. War between Great Britain and Russia was narrowly avoided, but a risky policy was carried with remarkable skill to a triumphant conclusion, and the questions at issue were settled by a European Congress at Berlin (1878), from which the prime minister returned with compliments from Bismarck and "peace with honour." (*See* BERLIN, CONGRESS AND TREATY OF.)

Beaconsfield's first and most popular imperial venture was the purchase (1875) of a majority of the shares in the Suez Canal Company from the bankrupt Khedive of Egypt. The Khedive's bankruptcy also involved other and less welcome entanglements. His creditors were mainly British and French, and in 1879 the two governments established a "Dual Control" over Egyptian finance. Khedive Ismail proved restive and was deposed, making way for the docile Tewfik. Meanwhile trouble had already come to a head on the Indian frontier. Russia had been intriguing in Afghanistan, and the Viceroy, Lord Lytton (son of the popular novelist), insisted that the Amir should accept a permanent British resident at Kabul. He refused and an Afghan campaign established a resident, whose murder entailed a second Afghan campaign. In South Africa the Transvaal, declared independent in 1852, was re-annexed by a stroke of the pen in 1877, partly with a view to a future South African Federation and partly to facilitate the suppression of the barbarous and aggressive Zulus. The Zulu war of 1879 achieved the latter objective, not without a tragic and avoidable military disaster at Isandlwhana.

Gladstone had nominally retired from politics in 1874, but "Beaconsfieldism," with its reckless disregard (as he held) of the rights of Bulgarians, Afghans and Zulus, called him back to the fray in the mood of a crusader. His "Midlothian campaign" of oratory in the last weeks of 1879 created a profound impression,

and the election of 1880 gave the Liberals a decisive victory. Disraeli died in 1881. It was an amazing career which had carried the Jewish novelist and dandy, reluctantly accepted as a leader by the "gentlemen of England" in their rebellion against Peel, to the premiership of one of the strongest of British ministries. Gladstone was to live longer and, in a sense, to fare worse. Among the aspects of Beaconsfield's government his relations with the queen must not be forgotten. Courtesies more than oriental pleased even while they amused, and Victoria emerged at last from the long and unpopular seclusion in which she had venerated the memory of Albert. The way was prepared for the sentimental enthusiasms of the Jubilee period.

Industrial Legislation.—The middle part of the period covered by this section was a very important one in the history of Labour Legislation. A case in the courts in 1867 decided that trade unions were "illegal" associations and therefore were unable to sue their officials even though (as in the case at issue) their officials embezzled their funds. It so happened that various criminal assaults on "blacklegs" had recently concentrated unfavourable attention on the Unions, and a Royal Commission had been appointed to investigate them. It now became necessary to divert this Commission from its original purpose, and to secure from it a report recommending the "legalising" of unions. The Labour case was ably conducted by Thomas Hughes, Frederic Harrison and Applegarth, a trade union secretary, and a favourable Report secured. The Trade Union Congress was established (1868) to press for legislation on these lines. Gladstone's government enacted a bill (1871) which carried out the recommendations of the Commission but at the same time made all the usual forms of picketing illegal. A new agitation had now to be undertaken and carried on into the general election (1874), when 15 "working-men candidates" stood and two were elected. The new electors of the Second Reform Bill, who had supported Gladstone in 1868, turned over in large numbers to the Conservatives, and Disraeli responded with the Act of 1875 which legalized "peaceful picketing," and was reckoned as the charter of trade union liberties down to the end of the century. In the same year an Employers and Workmen Act abolished imprisonment of workmen for breach of contract and thus placed employees on the same legal footing as their employers.

Another notable agitation of these years, supported by trade unions all over the country, was that led by Samuel Plimsoll to restrain the dangerous overloading of merchant ships. The "Plimsoll line" was enacted by the Merchant Shipping Act of 1876, another measure of the Conservatives. None the less the working-men M.Ps. henceforth conducted themselves as members of the Liberal party—"Lib-Labs" as they came to be called by Labour politicians of a later generation who stood for socialism and the independence of labour.

The most notable extension of trade unionism in these years was the Agricultural Labourers' Union of Joseph Arch. But this and other unions that catered for the worse-paid trades were severely curtailed by the period of acute trade depression that began in the middle 'seventies and lasted till 1888. The causes of this depression, fixed like a great gulf between mid-Victorian and late-Victorian prosperity, were many. America and Germany were beginning to copy our industrial methods and to dispense with our exports. British capital began to flow abroad more freely than before. The substitution of steel for iron, by lengthening the life of rails and other goods, diminished the rate of renewals, and a series of inventions in the metal trade processes involved the scrapping of costly plants and the substitution of Spanish and other foreign iron ores for the inferior products of British mines.

THE OLD PARTIES AND THE NEW DEMOCRACY, 1880–95

When we review these 15 years of English History, the salient points that catch the eye are on the one hand Irish obstruction, Gordon at Khartoum, the first Home Rule Bill and the split in the Liberal party, the Parnell Commission and Divorce, the partitioning of Africa, the second Home Rule bill and the retirement of "the Grand Old Man"; and on the other hand, distress and unemployment, the rise of socialism, the Dock Strike, the "new unionism," the Independent Labour Party. The notable fact is that these two sets of events seem to be entirely unrelated to one another. Parliamentary politics were not concerned with the English people, and the English people impinged but slightly on parliamentary politics. Of course a detailed survey would note many exceptions to this sweeping generalisation, but the impression it conveys is in the main correct, even though a Reform Bill of 1884 proclaimed a fully democratised male electorate. How is this to be explained? Partly by the characters of the leading statesmen. Gladstone, the Liberal leader, was a survivor from a past generation; his return to politics had been provoked by the wrongs of foreign peoples, and his interest throughout his last phase was absorbed by the wrongs of the Irish. On the Conservative side, Disraeli, who ever since he wrote *Sybil* in the 'forties had realized that the problem of "the two nations" was the dominating problem of England, was succeeded by Lord Salisbury, a man of massive intelligence and little imagination, whose main interest was foreign policy. Two statesmen there were, of great energy and ability, who might in combination have diverted English politics to English problems,—Joseph Chamberlain and Lord Randolph Churchill. But Chamberlain called himself a Liberal and Churchill called himself a Conservative. Moreover, Chamberlain left the Liberals in 1886 and did not join the Conservatives till 1895, and Churchill quarrelled with his party and reduced himself to impotence in 1886. Thus the situation was unpropitious on the parliamentary side. At the same time the English people must share the blame, if blame it be. They had not yet learnt to formulate their aspirations in a practicable shape, nor to use the parliamentary machine which the second and third Reform bills had placed at their mercy.

The Policy of Extrication.—Gladstone, reluctantly accepted as prime minister by the queen, took office (1880) with a mission to undo the evil wrought by Beaconsfield in Afghanistan, South Africa, and Egypt. In Afghanistan the problem of extrication, as it may be called, was satisfactorily solved. British claims were abandoned and the new Amir became a good friend of British India. In South Africa the Transvaal Boers were given back their independence, under British "suzerainty," but only after the hesitations of the home government and the impatience of the British commander in Natal had provoked hostilities and incurred the minute, unnecessary, and humiliating defeat of Majuba (1881). The Egyptian problem was much more complicated, and extrication impossible. Egypt was a European, not merely a British, problem, and Gladstone's government, enmeshed in a tangle of obligations, found themselves reluctantly enacting a policy they unfeignedly regretted. In 1881 an Egyptian revolt under Arabi attempted to overthrow the Dual Control. France urged joint intervention, secured it, and then withdrew from it. Wolseley defeated Arabi at Tel-el-Kebir (the last battle where British soldiers fought in red coats), and the way was opened for Lord Cromer's 24 years' rule (1883–1907) which did more for the material welfare of Egypt than all the Pharaohs and Ptolemies of past ages. But while Egypt under Arabi was revolting against the Dual Control, the Sudan under the Mahdi was revolting, much more successfully, against the tyranny of Egypt. An Egyptian army was utterly destroyed at El Obeid in 1883. Gladstone's government determined that the Sudan must be abandoned, and sent out General Gordon to report on the situation and to extricate the Egyptian garrisons at Khartoum and elsewhere. Gordon was besieged in Khartoum (1884), and the relief expedition failed to arrive in time to save him. Gladstone was denounced as the "murderer of Gordon"; Gladstone's supporters, on the other hand, held that Gordon, by disregarding his instructions, had created the situation that led to his death. (*See* SOUTH AFRICA, UNION OF; TRANSVAAL; SOUTH AFRICAN WAR; EGYPT; SUDAN.)

Meanwhile Ireland had been occupying all too much attention. Parnell, who hated England as only an Irishman has a right to hate her, used his Nationalist party in the House of Commons to obstruct business by endless and irrelevant oratory: hence the strict rules of "closure" which since that date have governed debate. At the same time he secured control of the Land League,

a kind of "trade union" of Irish tenant farmers, and thus manipulated the forces of agrarian disorder and boycott in Ireland. A Land Act (1881) gave the tenants their "three Fs" (fair rent, fixity of tenure, and free sale), but Parnell was determined to use his organization to force Home Rule. His arrest and imprisonment only made matters worse. In 1882 the Irish Secretary (Lord Frederick Cavendish) and the permanent undersecretary were murdered in Phoenix Park.

Domestic Legislation.—The record of the government was by no means barren of domestic legislation. A popular Ground Game act enabled all occupiers of land (and not only landlords) to shoot hares and rabbits. Chamberlain's first Employers Liability act made employers liable, within certain limits (since abolished), for accidents to their work-people. The Married Women's Property act gave a wife the same rights of acquiring, holding, and bequeathing property as a widow or spinster, *i.e.*, she was no longer at the financial mercy of her husband. The third Reform bill (1885) roughly doubled the electorate, abolished the age-long distinction between the county and borough franchises, and gave to the wage-earner outside the boroughs the vote enjoyed since 1867 by his fellow within them. Mention should also be made of the Bradlaugh controversy. The atheist M.P., Charles Bradlaugh, demanded the right to "affirm" his loyalty without a religious oath. Gladstone supported, and therefore not only bigots but also Conservatives opposed, his demand, and the inevitable (though long delayed) upshot of the controversy was the extension to atheists of the rights already extended to Roman Catholics (1829) and Jews (1858).

The First Home Rule Bill.—Gladstone's government was defeated on a clause of its Budget and resigned in June 1885, and the "Caretakers" (Salisbury) government took office till the new registers were ready for a general election. The election when it came (Dec. 1885) gave the liberals a majority of 80 over the conservatives, thanks in part, no doubt, to Chamberlain's "unauthorized" (*i.e.*, non-Gladstonian) programme of reforms, including the famous "three acres and a cow" to catch the new rural voter. More significant was the Irish result, where Parnell had secured every seat but one outside Ulster. Gladstone now declared for Home Rule; the conservatives resigned, and Gladstone introduced his first Home Rule bill (1886); but 93 "Liberal Unionists," among whom was Chamberlain, united with the conservatives in defeating the measure. Gladstone appealed to the country and was decisively defeated.

Lord Salisbury.—Lord Salisbury's (1886–92) government was, by comparison with what went before, a time of political tranquillity. Ireland was restive, but the Nationalist party was crippled by the growing eccentricity of Parnell, culminating in his divorce case and the consequent divisions among his colleagues. In 1888 the modern County Councils were established and took over most of the work hitherto discharged by nominated magistrates; among the "counties" not the least important was a new one, the County of London. In the sphere of foreign policy an immensely important transaction, the partitioning of tropical Africa among the Great Powers, was carried through with less friction than might have been expected (*see* AFRICA: *History*). The navy was thoroughly overhauled and the "two-power standard" explicitly established—the two powers whose combined navies were envisaged being France and Russia, for Germany as yet had no navy of importance.

The election of 1892 enabled Gladstone to return to office at the unprecedented age of 82, but his majority depended upon the Irish Nationalist vote, and the House of Lords, in rejecting his second Home Rule bill (1893), could claim that they had the support of the majority of the members elected for British constituencies. Gladstone retired in 1894, and the one-year Prime Ministership of Lord Rosebery is notable for Harcourt's Budget, which revised and increased the "Death Duties," applying to them the principle of "graduation," since applied also to the income-tax. Perhaps it is also notable for the fact that Lord Rosebery won the Derby. The election of 1895 restored the Conservatives to power.

Unemployment and Socialism.—The industrial depression which began in the 'seventies continued until 1888, and London became uncomfortably familiar with processions of the unemployed; *e.g.*, the Trafalgar Square disturbance of Jan. 1886, when august windows were broken in Pall Mall. Meanwhile a new proletariat with the habit of reading was growing up. Victorian politics had failed to solve the problems of poverty, and the socialism of Karl Marx seemed to offer an alluringly drastic remedy. Hyndman founded the Social Democratic Federation which adopted a programme of doctrinaire socialism (1883), and William Morris, aspiring to restore true craftsmanship and to rescue the workman from the tyranny of the machine, lent his powerful aid to the socialist movement. How appalling the facts of poverty were was demonstrated by Charles Booth, who undertook at his own expense a statistical survey of London and found 30% of the population to be living below "the poverty line." His conclusions were brought home to a wider public by the publications of General Booth, the founder of the Salvation Army.

Trade Unionism had also become more and more "aristocratic" (*i.e.*, limited to skilled craft unions) since the 'seventies, for the simple reason that the depression practically extinguished the unions of the worse-paid types of worker. The Trade Union Congress was scarcely more in touch with real poverty than the House of Commons. But there was a minority of trade unionists dissatisfied with this position, among them the engineer, John Burns, and these found their opportunity in the great Dock Strike of 1889. Led by Tillett, Burns, and Mann, practically the whole of the Thames riverside labour came out on strike for "the docker's tanner." Widespread sympathy was expressed, large subscriptions were raised, and the aged Cardinal Manning played a spectacular part in securing the dockers' victory. The result was a great extension of trade unionism among the unskilled and hitherto unorganized workers. Both trade unionism and socialism were powerfully affected. Trade unionism became democratic, and the main stream of socialistic energy was diverted from revolutionary idealism into the practical work of organizing and fighting the industrial battle on industrial and political lines.

A Labour party independent of liberals and conservatives was the natural conclusion of the tendencies just indicated. In 1887 Keir Hardie, a Scottish miner and socialist, had urged the Trades Union Congress to found such a party, but in vain. Undiscouraged, he founded it himself and was elected for West Ham in 1892. This was the origin of the "Independent Labour Party." All its candidates were defeated in 1895, but (to complete the story here) the Trade Union Congress was being slowly stirred to action. In 1899 a joint committee of the T.U.C., the I.L.P., and two socialist societies was established under the title of the Labour Representation Committee. This was in fact the foundation of the Labour party, and its first secretary was Ramsay MacDonald.

Victorian industrial history reads like a prologue to the 20th century, whereas the culture of the Victorian upper classes has already become something remote and, as we say, "Victorian." In the sphere of letters the last 20 years of the century mark the long evening of the Victorian age. One by one the great lights were extinguished—Carlyle, George Eliot, Rossetti, Darwin, Matthew Arnold, Browning, Tennyson, Newman, Morris, Ruskin. No stars of equal magnitude seemed left in the sky. Of these great Victorians only William Morris was in his prime during the 'eighties. Himself a craftsman in many trades, he taught that not only churches but houses, not only pictures but wallpapers, books and furniture, pots and pans should be works of art. His influence has been immense, but he came too late to redeem the age he lived in. Fashions change, but it is hard to believe that a generation will ever arise that will admire Victorian domestic architecture. The art of building touched its nadir just at the time when building was more in demand than ever before, owing to the unprecedented growth of population.

IMPERIALISM, 1895-1901

The Last Phase.—The climax of the Victorian age was also the climax of the imperialist movement; and this coincidence

was appropriate, for a sturdy optimism had been the keynote of the age, and in imperialism optimism attained its grandest dimensions. At the beginning of the reign "the colonies" had been little esteemed; they were insignificant, and many expected that with growth they would demand independence. A variety of causes falsified this forecast. The Durham Report indicated lines of development which reconciled local independence with imperial union; the growth of steam transport both favoured emigration and kept the emigrants in closer touch with the mother country; the decline of European and the growth of colonial markets suggested the importance of inter-imperial trade; and the growth of mighty armaments on the continent suggested the value of imperial union and expansion as a source of power. Disraeli saw which celebrated the close of the pomps and splendours of the Tory party. His imperial ventures were not auspicious but the fiascos of Gladstone's anti-imperialism helped the movement forward. And now a political leader for the cause was found in the ex-Liberal Chamberlain who, joining Salisbury's cabinet in 1895, selected for himself the hitherto little-esteemed office of colonial secretary. Another name, however, symbolizes late Victorian imperialism more convincingly than that of any politician—the name of Rudyard Kipling. His first volume of Indian tales had been published in the year of the first Jubilee, and he attained the stature of a national spokesman with his *Recessional*, which celebrated the close of the pomps and splendours of the second Jubilee (1897), a hymn which, with all its genuine humility, expresses the pride of a "chosen people," privileged above other nations to bear "the white man's burdens." The Jubilees themselves, it need hardly be said, were, and could not help being, immense advertisements of the greatness of the British Empire.

The Sudan and South Africa.—In 1896 the steady growth of Egyptian economic prosperity made possible the announcement of an Anglo-Egyptian expedition to reconquer the Sudan. Gordon would be avenged and an immense new tropical province opened to the benefits of British administration; and after 15 years of Mahdism the province was certainly in need of it. Sir Herbert Kitchener took command and astonished the world by the efficiency and economy of his achievement. The battle of the Atbara was fought in April 1898 and the crowning victory of Omdurman (the Khalifa's capital, hard by the ruins of Khartoum) in July. In this battle 11,000 Dervishes were killed at the cost of 48 lives to the victorious army, and the total expenses of the campaign would have paid for about *eight hours* of the British effort in the later stages of the Great War. Yet these events had a rather ugly sequel. Within a week of the occupation of Omdurman it was announced that a French explorer, Major Marchand, had hoisted his flag at Fashoda, 500 miles further up the Nile. The French flag was lowered, but not without a severe straining of diplomatic relations between London and Paris. Britain had been, it appeared, "on the verge of war." The "splendid isolation" of late Victorian Britain was less secure than in retrospect one is apt to imagine. A brief history like the present has omitted all the abortive war-alarms of the last 20 years of the century, but they would make a considerable list. The enemy was always France or Russia; Germany had not yet crossed Britain's path.

On New Year's Day 1896 an astonished public read that a force of mounted police under Dr. Jameson had raided the Transvaal Republic. Its failure was immediate, but "the Raid" was a symptom of the growing tension created by the antagonistic policies of Cecil Rhodes, prime minister of the Cape, Rand gold-magnate, and creator of Rhodesia, and Paul Kruger, President of the Dutch Republic of the Transvaal. About ten years earlier, one of the greatest gold fields of the world had been opened up in the very middle of the Transvaal. The gold-mining population (Uitlanders) had many just grievances against the treatment they received; in particular they were excluded from any share in the government of the Republic. Most of them were British, and in March 1899 they addressed a petition to Queen Victoria. Chamberlain took up their cause. Milner, the British High Commissioner of South Africa, failed to extract any concessions from Kruger, and the upshot was war (Oct. 1899). The early stages of the war proved that the Boers were better prepared than the British, and the three defeats of "Black Week" (Dec. 1899) ushered in a winter less terrible but quite as humiliating as the Crimean winter 44 years before. Three British forces were besieged on British territory in Kimberley, Ladysmith, and Mafeking. With the coming of spring, numbers began to tell, and the clouds lifted; the beleaguered garrisons were successively relieved, and in June Lord Roberts entered Pretoria. It seemed that the war would end before the century. It did not do so, however, and guerilla tactics prolonged an irritating game of military hide-and-seek well on into 1902. The end of the century was to be marked not by the end of the war but by the death of the Queen. Victoria died, after a brief illness, on Jan. 22, 1901, in her eighty-second year. (*See* SOUTH AFRICA, UNION OF; SOUTH AFRICAN WAR; TRANSVAAL.)

The Queen.—This is not the place to attempt an estimate in detail of Victoria's character. The best way of measuring her achievement is to study the position occupied in public esteem by her immediate predecessors. The Crown as it came to her was associated with political ineptitude and moral degradation. She wore it for over 60 years and left it the unique symbol of national honour. Her political opinions were often shrewdly formed and always strongly held, but it is easy to exaggerate the queen's intellectual gifts and to attribute to her a far-seeing statesmanship to which she has no claim. Queen Victoria's achievement was her character. If rigid devotion to duty and unflagging industry are to be respected, then Victoria is entitled to respect. She was worthy to preside over a great nation in one of the greatest epochs of its history. In some ways her plainness of speech and of thought, her simple piety, her regal and maternal dignity make her more typical of her age than any of the brilliant men whom we call "eminent Victorians," and homage is paid both to the queen and to her subjects in the suggestion that Victoria was, of all her generation, the most Victorian. (*See* also VICTORIA, and the various biographical articles.) (D. C. So.)

XII. THE TWENTIETH CENTURY

Across British history since 1901 the World War draws a heavy line; it is impossible to see the period otherwise than in the three divisions—before the war, the war-period and after the war. During the years 1901–14 certain forces, the result of a long period of peace and prosperity, which had already broken the crust of exclusive social traditions and of literary and artistic convention, began to affect national affairs and political life. The period is marked by a restless, uneasy re-alignment of class and party, so searching and at times so violent, that in the last years before the war the very frame of representative government, as the 19th century had known it, seemed on the verge of breaking to pieces under the strain. The war, with its concentration of the national mind, restored balance and stability to the nation, though the world was shaking. After the war, many as the difficulties were, at least there was no appearance of the strange plunge towards an incalculable gulf, which was gravely affecting men's minds during 1909–14.

FROM 1901 TO THE OUTBREAK OF WAR

The period opens, however, with very little indication of a new stirring of national life. The death of Queen Victoria (Jan. 22, 1901), the end of that long reign, coincident as it had been with the rise of a new England in a new Europe, and the accession to the throne of a genial man of the world with wide interests and a zest for life, might suggest the passing of a dead-weight of tradition. But in social and artistic matters the tradition had for some time been weakening; and in national affairs, once the excitement of these events was over, the old seemed to be depressingly present, and the cry for the new depressingly unanswered.

The recovery of the British armies in South Africa during 1900 had not ended the war. The Conservative Government, renewing its mandate by the "khaki election" of 1900, had not renewed its strength. Burdened with the blame for the disasters of the early months of the Boer War, and then for the tedious weariness of a long struggle with the elusive mobile commandos of the Boers, the Government appeared to be a rather lackadaisical survival of

19th century Conservatism. And the Opposition appeared to be an equally ineffective survival; there were Liberals who applied to the war the old Cobdenite-Gladstonian tradition, and condemned it as a deplorable piece of provocative imperialism; there were others who, with Lord Rosebery, felt that a Liberalism thus setting itself against the national pride had no future before it.

In such circumstances politics became little more than a mass of inchoate animosities and recriminations. The session was barren. An education bill designed to meet the awkward situation produced by the Cockerton judgment, which had imperilled the whole provision of higher education at the public expense, was hotly criticized, and eventually replaced by a temporary measure permitting education authorities to "carry on" for a year. W. St. J. F. Brodrick (*see* MIDLETON, VISCOUNT) produced a scheme of military reorganization, with a system of army corps and decentralized commands; but as his corps were admittedly to a great extent "skeleton" formations, he was bidden to learn some more practical lesson from British failures in South Africa, and pay attention to the better education and war training of officers and men. In the latter part of the year the Liberals who were attacking the conduct of the war found a new theme. Lord Kitchener, who was now in command in South Africa (Lord Roberts having returned in January to be the last great public man to be received by Queen Victoria and to take from her hands the Order of the Garter) was meeting guerilla warfare with a new strategy of cordons of troops operating from lines of blockhouses to clear whole districts, emptying, and on occasion burning, the farms to which the Boers retired, hiding their arms. Concentration camps, for the reception of women and children removed from the cleared districts, had inevitably the flaws of an emergency provision; and reports of ill-health, loss of infant life, and insanitary conditions gave material for Liberal agitation, bitterly resented by those who could, quite justifiably, represent the camps as an almost quixotic piece of humaneness in warfare, rendered partly ineffective by the Boers' own insanitary habits. The whole subject bringing to such a definite point the irreconcilable difference of opinion between those who felt the war must be finished, and those who merely demanded that it should be stopped, exacerbated people's minds. Rioting broke up a peace-meeting in Birmingham in December, and forced Lloyd George to escape for his life.

The Liberal Revival.—Within a few months the whole scene was changed. By March 1902 the Boer leaders were known to have opened communications with Lord Kitchener. Peace was signed in May at Vereeniging, on terms generous enough to the Boers in the matters of amnesty and repatriation, with a grant of three millions for re-establishing devastated farms, but also conclusive as to the unity of South Africa under the British Government. Nothing remained to cloud the anticipations of the coronation, which was not only the first for 64 years, but the first great imperial coronation. When last a sovereign of the United Kingdom had been crowned, the colonies had been poor, thinly populated, distant—barely a reality at all to the people at home—and India a chartered company's territory in somewhat indeterminate relations with the Crown. Now the colonies were great and prosperous countries, made much more real and vital to the nation by the explicit imperialism of the Conservatives. Moreover, the king was emperor of India. At the moment of its long-delayed success in South Africa the nation was thoroughly in the mood to savour the meaning of the gay and varied contingents of troops from every quarter of the empire, camped in and around London. Then in the height of the excitement, with princes and potentates arriving from all over the world, King Edward suddenly fell ill, and the ceremony had to be postponed until his recovery from an operation for appendicitis. The coronation finally took place, with undiminished splendour, on Aug. 9.

So far, the nation had been paying little attention to events which suddenly promoted a much more healthy state of party opposition in the Commons. For some time past it had been felt that the school boards of the 1870 act, though they had worked well in towns, were on the whole too parochial in personnel and policy to envisage education in the large and generous way that was becoming increasingly necessary. A new bill abolished them, and placed education in the hands of statutory committees of the borough and county councils. For the moment the significance of the fact that Church of England schools were brought into the reorganization *pari passu* with the undenominational board schools escaped notice; then the old Liberal nonconformist spirit awoke, internal divisions lost their importance, and the Opposition became a fighting force. It was not until the autumn session, when non-payment of rates, as a drastic assertion of the rights of conscience against legislation, was launched as a definite policy, that this change in the atmosphere of the House of Commons had much reverberation in the world outside.

Tariff Reform.—The situation had hardly time to develop seriously before it was lost in a far more startling political storm. On May 15, 1903, Joseph Chamberlain, who had spent the winter in an official—indeed almost a State—visit to South Africa, made a speech to his constituents in Birmingham in which he pleaded for a closer economic bond of empire in an imperial preferential tariff. At first sight there is something astonishing in the speed with which this pronouncement became the cardinal factor in public affairs. But three considerations provide an explanation. Firstly, there had for some years been increasing complaint of the unfair position of the British manufacturer in an open home market against the protected competition of the foreigner, and of the "dumping" of foreign products, to which much of the unemployment in Great Britain was attributed. Secondly, there had been, in remarks by recent chancellors of the Exchequer about a need for broadening the basis of taxation, hints of a reconsideration of fiscal policy, to which the reimposition of a shilling "registration" duty on corn during the Boer War had given point. Thirdly, the commanding position of Chamberlain in the cabinet, and his popular reputation as a vigorous driving force beside the somewhat placid, academic figure of A. J. Balfour, who had succeeded Lord Salisbury as prime minister in 1902, were enough to bring together in a flash, when he made such a pronouncement, all the half-suggestions of a change in the tariff system. It is no wonder that this speech, though in fact he had used much the same language to the Imperial Conference of 1902, became the storm-centre; nor is it any wonder that Liberals raised at once in its broadest aspect the old issue of Free Trade and Protection (*qq.v.; see* also CHAMBERLAIN, JOSEPH).

During the session of 1903 it remained principally a House of Commons question; the attack lay along the line of the precise degree of cabinet responsibility for the new pronouncement. C. T. Ritchie's attitude, in introducing the budget, and the discussions on the budget, revealed a strong free-trade element among the Conservatives. But Balfour refused to admit any vital difference between himself and Chamberlain, and reiterated that the whole question was one for enquiry and investigation, not for immediate party warfare. Almost immediately the simple imperialism of the first stage had become complicated with the other issues of national finance and the protection of national industries. This became clearer in the autumn of 1903, when the campaign on both sides developed rapidly outside parliament. The controversy lacked no skill or competence on either side; and in the analysis of statistics, the estimation of the comparative position of employers and their employees in Great Britain and elsewhere, the elucidation of the subtle reactions of our long free-trade policy upon high finance, banking and international credit, much was achieved in the course of a struggle which enlisted, quite unprecedentedly, practically the whole academic as well as the whole political force of the nation. It made public life vivid and extraordinarily active for the next two years. It was obvious, once division of opinion had become clear, that Chamberlain and the free traders could hardly remain in the same cabinet. Resignations were to be expected; when they came, they seemed only to make the situation more bewildering. The notable free traders, Ritchie, Lord George Hamilton, Arthur Elliot, Lord Balfour of Burleigh, resigned in September. But Chamberlain had resigned as well. In the reconstruction his son, Austen Chamberlain, succeeded Ritchie at the Exchequer. Another distinguished free trader, the duke of Devonshire, resigned in October.

The controversy did not occupy the whole field in 1904. A

licensing bill, the outcome of much recent discussion about the excessive number of licensed houses in proportion to population in many towns, set up a statutory compensation fund for unrenewed licences in every quarter sessions area. It added a minor weapon to the Liberal armoury, inasmuch as it gave implicitly legal recognition to the growth of a legitimate, though not hitherto properly legal, expectation of steady renewal of a licence, and limited the discretion of the justices. Of no controversial importance was the act for licensing and numbering motor-cars; the insertion of a 20m. speed limit betrays the mind of the time.

The Entente Cordiale.—The achievement of the year 1904 which most justified Balfour's continuance in office was undoubtedly the agreement which Lord Lansdowne, who had succeeded Lord Salisbury at the Foreign Office in 1902, concluded with France. Its terms provided for French recognition of British influence as preponderating in Egypt, in return for a similar recognition of French interests in Morocco. The welcome it received grew out of something much deeper than the end of the long friction over the dual control in Egypt. The agreement was taken as a sign that the policy of "splendid isolation," which had had aspects of something more than discomfort during the early stages of the Boer War, was being in some measure abandoned. The establishment of better relations with France was attributed largely to King Edward's influence, and to his personal popularity in Paris. From this time onwards he was considered to have found a sphere in which a constitutional monarch might very well take a real share in the work of his ministers.

If 1904 was thus a year which kept some breadth of interest in politics, 1905 was so nearly a year of exclusive concentration upon tariff reform that Balfour, by remaining in office, seemed to do little more than make a present to his opponents of 12 months' electioneering. Under the new Tariff Reform League on one side and the revived Cobden Club on the other, the battle was fairly joined. Reputations were made on the free trade side; Lloyd George, already prominent from his opposition to the Boer War, greatly increased his power over Liberal meetings; and Winston Churchill, who had refused an equivocal position, and left the Unionists in 1903, reached the front rank of politics at a bound. As the year drew on to the inevitable election, argument naturally deteriorated. Tariff reformers' cries of "the foreigner will pay," and "tariff reform means work for all," were matched by Liberal posters of the big loaf and the little loaf. Steadily it became more and more clear on which side the British public as a whole was ranging itself; and not even the palpable presence of thousands of unemployed, to point the tariff reformers' moral, made the mass of working men willing to risk the gamble of food taxes for the chance of more steady employment.

On Dec. 4, 1905, Balfour at last resigned, having, it must be admitted, pulled his party over the first shock of the controversy. Some faint hope existed among the Unionists that the internal divisions of the Liberals might revive to weaken them. But when Sir Henry Campbell-Bannerman's Government was announced on Dec. 16 it was seen that H. H. Asquith (afterwards Earl of Oxford and Asquith) was at the Exchequer, Sir Edward (afterwards Viscount) Grey at the Foreign Office, and R. B. (afterwards Lord) Haldane at the War Office; and a speech by Lord Rosebery a few days later made it as clear as any such thing could be made that nothing had gone on behind the scenes; Liberal imperialists had simply accepted the prime minister's invitation to join him. The new prime minister, it may be remarked here, has his place in constitutional history; he was the first to hold the post as an office. Hitherto the head of the Government had always been obliged to take some office recognized by the constitution—usually the sinecure dignity of first lord of the Treasury, for "prime minister" was, in strictness, only a descriptive appellation. Now by a royal warrant, giving the prime minister, under that title, a place of official precedence, the king established his position as a formal office of State. (*See* PRIME MINISTER.)

The Landslide Election.—The general election which followed was the most startling that the country had ever seen. Member after member of the late Government lost his seat, including Balfour himself. The astonishing new house was composed of 397 Liberals, 57 Labour members, 83 Irish Nationalists and a mere 157 Unionists. The Government had a possible maximum majority of 374. Free Trade had beyond all question played the largest part in the results; the introduction of indentured Chinese labour into the Rand gold-mines had also provided Liberals with an electoral weapon which they used with effect. It was obvious, too, that Balfour's long continuance in office after his party had become disunited had not only stimulated to an unusual degree the mere desire for a change, but had also revived in the electorate that sense of inefficiency in their Government which had been strongly vocal during the Boer War. There was undoubtedly another important element in the situation. While the labour world had been rapidly becoming more politically energetic and more articulately conscious of its strength, it was not yet in a position to appear in full force as a distinct party, and therefore its effect at the polls was a heavy reinforcement of the Liberal vote. Two things above all had profoundly affected Labour. One was that in 1899 after long and patient work by Keir Hardie (who had been returned in 1892 as the first true Labour member) and others, the various elements in Labour politics—trade unionism of the old-fashioned strictly industrial kind, Fabianism and Socialism—had been drawn together in the foundation of the Labour Representation Committee; in the intervening years this first success was consolidated; the party pledge, after some internal struggles, was imposed, with a compulsory levy on members of certain trade unions. But what most of all inspirited it, and helped towards the acceptance both of the party pledge and the levy, was the famous Taff Vale case of 1902, in which, after a railway strike, the unions had, to their dismay, found that the law, as it stood, could be held to render them liable for damages for the actions of any individual union member during a strike. The labour world naturally drew together wholeheartedly to demand amendment of the law; and since Liberal candidates sympathized entirely with this demand, the Taff Vale case must be added to the reasons for the overwhelming Liberal success. So must the Labour demand for a more active social policy generally. The early years of the century were on the whole free of serious labour disturbances. But active political Labour was aware that employers were working on an ever-narrowing margin of profit, and that, with prices slowly but distinctly rising, there must be determined and difficult wage-struggles ahead; and the wider social conscience was increasingly concerned about unemployment, "sweated" industries, bad housing and the helplessness of the manual worker in sickness and old age.

The Struggle with the House of Lords.—All this, while it meant that the new Liberal Government entered upon its career full of ideas of social reform, meant also that every element in the country afraid of, or intellectually cautious about, social and economic change, drew together, aghast at what representative government might suddenly come to imply, with such a House of Commons as then existed. A process at once began of undermining, in the public estimation, the status of the large majority. It was obviously a freak; the country could not have seriously intended such an obliteration of Conservatism. It was due to the sweeping effects of one particular question—Free Trade—and could not be taken as an overwhelming mandate for drastic social legislation. There was truth in this; and a House of Commons so notoriously unbalanced in composition could not be surprised if the House of Lords acted in redress of the balance. Thus the history of the next eight years is one of considerable legislative achievement, in the presence of forces of opposition which, by the very nature of the case, tended more and more to weaken parliamentary and ministerial authority in the mind of the public.

Much was achieved. The Trade Disputes Act of 1906, definitely placing trade union funds above the normal operations of the law in actions of tort; a reorganization of the military system in 1907, which created, in the Expeditionary Force and the Territorial Army, a machine which was to meet the first strain of the World War in 1914; the Coal Mines Eight Hours Act and the Old Age Pensions Act of 1908; the Housing and Town Planning Act, the Trade Boards Act for "sweated" industries and the

Labour Exchanges Act of 1909. But the harvest was gathered with perpetual friction; many bills were lost, and in matters of education and licensing especially the Government was not allowed to carry its proposals. On the Liberal side of the house there was constant agitation on the question of the power of the House of Lords. In one matter at least the latter had been unwise: instead of waiting for the Licensing bill of 1908 (against which, with its proposals of terminating after 14 years all "monopoly value" in a licence and restoring its strictly annual character, there had been much outcry) to come before them in the usual way, they decided, at a meeting of peers at Lansdowne House, to reject it, and announced the decision. Nothing could have been more useful for rousing Liberal opinion against them: it lent itself so well to the complaint that the Lords did not even pretend to act properly as a house of parliament when Liberal measures were in question.

Yet no practical politician could expect to rouse really strong feeling in the country by a generalized attack upon the Lords for their conduct during three sessions. It would become a dry constitutional question, and the electorate, now that its fear of Protection was over, would fall back into all sorts of cross-divisions. And, finally, the attack must be striking and, as far as possible, sensational. For the public mind, losing its single interest of the tariff reform years, had scattered itself upon many things—the rapid expansion of motor transport; the extension and linking up of "tube" railways; the early successes in flying (mainly, as yet, with dirigible balloons, but Farman and the brothers Wright had flown in aeroplanes in 1908); a growth of the week-end and country cottage habit; and an increase in pleasant ways of spending money.

The "People's Budget."—Battle, then, must be joined on a new and large issue, to work up the electorate; on an issue of social policy, to secure Labour support, and, if possible, on an issue that should bring into the open the kind of opinion which was behind the House of Lords. Liberal strategy based itself, very skilfully, on a frankly socialist budget. If the Lords threw it out, they would startle the nation by an action which, from long disuse, had become constitutionally almost unthinkable. They would appear to Labour to be refusing openly at last to provide the necessary implement for ameliorations. And it might well be argued that the strength of the hostility to the Government would be revealed as lying in the apprehensions first aroused by their second budget, which had introduced differentiation between earned and unearned incomes, a graduated income-tax and a super-tax death-duty on estates of over a million; so that the power behind the Lords would be displayed as capitalism selfishly concerned for itself. Thus, in 1909, the "People's Budget" was launched, making further differentiation between earned and unearned incomes, applying the super-tax to large incomes as well as large testamentary dispositions, and laying a tax on the "unearned increment" of land enhanced in value by industrial or other developments in the neighbourhood. The Lords based their action on the fact that the "unearned increment" tax involved a land valuation scheme, which was not legitimately part of a finance bill. They had the precedent of the paper duties affair in 1861. No doubt, too, they relied upon the obvious ebb of the amazing tide of 1906, and upon a fairly general feeling that Liberal legislation had already gone rather far. Therefore, accepting the challenge, the Lords, late in a stormy political year, threw out the Finance bill, and opened a struggle which occupied the whole of 1910. Two general elections were held—the first in Jan. 1910 for authority to force through the "People's Budget"; the second in Dec. 1910 for authority to carry the measure that was to end such struggles between the two houses—the Parliament bill.

In both cases the Government was able to achieve its object; in neither case, however, in such a manner as to put an end to the Opposition's questioning of the nature and true extent of its authority. The election of Jan. 1910, on the issue of the budget, seemed to support the view that, Free Trade apart, the Liberals had no overwhelming mandate from the nation; the Conservatives now returned actually in a slight majority over the Liberals, and the Government therefore depended upon the Labour members and the Irish Nationalists. The Opposition accepted this as a decision on the budget, which was passed; but mainly because the holding-up of the national finances was an awkward and dangerous way of carrying on a contest, which, after their action on the budget, had better be fought out fundamentally on the issue of a great constitutional change. The problem was twofold. One of the peculiar provocations of the budget incident had been that a house with no element of election in it had the right to render futile a House of Commons majority. Hence the simplest aspect of the question—a statutory limitation of the power of the Lords—was complicated with the possibility of a reformed upper house to which large powers might still be left because of its more satisfactory character.

The Parliament bill was, at any rate, ingenious. Postponing in its preamble for later consideration the possibility of an amended upper house and the powers it might be given, it proceeded to lay down that, until such reform, measures which had passed the Commons unaltered in three separate sessions might be presented for the royal assent without the consent of the Lords; and that financial measures might be so presented, in similar circumstances, without repeated passage, a month after passing the Commons. It was the gravest constitutional measure since the Reform Bill of 1832—perhaps, even, since the Act of Settlement; and there were those on both sides who looked for some agreement that might evade such drastic enactment. It was significant of the position King Edward had attained that hope, at this crisis, pinned itself to his tact and sagacity; but his death, in May 1910, removed the hope centred in him; and it must be said that it had been cherished rather by the popular mind than by serious politicians. Conferences continued through the year, until in November it was announced that they had failed. The gravity of the announcement of another appeal to the country was enhanced by Asquith's statement (he had become prime minister on Campbell-Bannerman's death in Feb. 1908) that he had only advised dissolution upon such conditions as would enable the Liberals, if successful at the election, to place the Parliament bill on the statute book against all resistance by the Lords. This was immediately taken as a reproduction of the guarantee given by King William IV. to Lord Grey for the passage of the Reform bill: although in the present case this must mean reducing the House of Lords to an absurdity by a mass creation of 400 or 500 peers, there could be no other interpretation of Asquith's words. The election of Dec. 1910 made little change; a gain of four seats by the Liberals was hardly conclusive, and there were Conservatives in both houses (they added the name of "die-hards" to political nomenclature) who would have had the Lords reject the bill, believing that the country would never stand such a creation of peers as was threatened. Others were for accompanying the rejection with a voluntary reform of the house, or with the institution of a referendum for solving deadlocks. Through all such proposals the Government held steadily on its way with the Parliament bill; the Conservative leaders shrank back at the last, and in Aug. 1911, by the abstention of the majority, the bill passed the House of Lords by 131 votes to 114.

The Years of Militancy.—The battle had been won, but the cost was now to appear. Extreme Conservative opposition in the country began to feel that against a Liberal and Labour majority, thus clear of constitutional obstacle, any and every form of obstruction and resistance might be used. Unfortunately, the temper of the nation had become one in which such notions could flourish. Twice within two years the country had been shaken by a considerable crisis, and each time with a violence of political methods hitherto unknown. The Tariff Reform controversy had begun it, with the "raging, tearing propaganda" of both sides; later by-elections and general elections had been consistently stormy. Undoubtedly the new Woman Suffrage campaign had been responsible for much of this. It had its justifications. Fifty years of quiet argument had had no effect, and women had no votes to compel politicians to listen. Their large processions and demonstrations, forcing the police to physical violence, courting imprisonment and producing there every possible problem for the prison authorities, had shown what might be done by

"militant" methods; and already the opposition to the Government's licensing bill and mining measures had taken the hint, and turned by-elections with whirlwind attack. (*See* WOMEN'S SUFFRAGE.) Militancy was in the air; it was to be the keynote of the next three years; and no class shrank from it. Indeed, restraints of all kinds seemed to be disappearing. The old exclusive "society" was being invaded by new wealth; Cubism in painting and new conventions in sculpture ruthlessly "scrapped" all the rules that earlier generations had valued; a new music did the like with conventions of rhythm and harmony.

The Government, after the interruption of 1909–10, returned to its social programme, passing in 1911 the Shops Act, establishing the weekly half-holiday; and Payment of Members (*q.v.*). But the principal measure—the National Health Insurance Act—was met with the new kind of opposition. It was open to some objections; the friendly societies were apprehensive of its effect upon their own finances; the actuarial calculations were not beyond criticism; the Labour Party translated the "right to work" policy into an attack upon its contributory basis. But reason was lost in a violent newspaper campaign, which attempted to bring about a strike of the medical profession against the duties which the act would lay upon them, and actually succeeded in inducing a large meeting of respectable, and even important, women at the Albert Hall to pledge itself not to "lick stamps" to affix to the cards of insured persons. It was absurd, but it had its alarming side. The Government also set itself to fulfil the statutory conditions for placing Welsh Disestablishment and Irish Home Rule on the statute book by passing them through the requisite number of sessions. They had other causes of anxiety. The hopes raised, in the first flush of the agreement with France, that our relations with all foreign Powers would grow happier, had waned. It had been becoming apparent that the exchange of visits between British and German municipalities, British and German journalists, and so on, were only superficially cordial; and even King Edward was able to maintain no more than a superficial friendliness in that quarter. In 1911 the Agadir crisis showed that Germany was far from consenting to that predominance of France in Morocco which Great Britain had recognized. Approaches to Russia made it rather appear that the end of isolation meant taking a place in the grouping of Continental nations. The launching of the "Dreadnought" in 1906, at first a source of pride as the originating of a new type of battleship vastly more powerful in speed and gunfire than anything afloat, had been seen to involve less flattering implications. If battleships of this kind, battle-cruisers and submarines, were to replace the old fleets, then another country might start in a naval race more on a level with Great Britain than had before been possible. The subject had come into prominence in 1908, when it appeared that Lord Tweedmouth, then first lord of the Admiralty, had been in correspondence with the German emperor, on the latter's initiative, on the subject of naval expenditure. Winston Churchill, who succeeded Lord Tweedmouth, made offers of a "naval holiday" which, however, met with no response. The whole matter was an uneasy background to an uneasy period.

But only a background; the British public during these years was more concerned with other aspects of public affairs. A railway strike in the hot summer of 1911, though not complete, had held up railway traffic for several days, and created a new anxiety about the power and the purpose of Labour. Syndicalism was finding its way into England from France, the *New Age* voicing this policy; and the first Labour daily newspaper, the *Daily Herald*, appeared in this year. Trade union membership was increasing; it advanced from 2½ millions in 1907 to 4 millions in 1913 (including those not affiliated to the Trade Union Congress). In 1912 the loss of the "Titanic" (*q.v.*), the biggest passenger vessel yet launched, on her maiden voyage, struck people aghast; and a strike of coal-miners showing as irreconcilable a temper on either side as the railway strike had shown, and, forcing parliament to pass a minimum wage bill for coal mines, raised spectres of what "direct action" might come to mean. There were worse spectres in the following year, when the huge sympathetic strike started in Dublin under James Larkin; and though the movement did not spread to the unions in Great Britain, and the "Triple Alliance" of railwaymen, miners and transport workers, established early in 1914, made a subtle distinction between a "sympathetic strike," which it repudiated, and a simultaneous strike for the individual objects of each union, the sense of the threat to the community grew more alarming.

The Verge of Civil War.—With so much hostility in the air, so much social and intellectual restlessness, the nation hardly noticed at first the precipitous slope down which it was hurrying in Irish affairs. Nothing could prevent the Home Rule bill becoming law in 1914. Unionists concentrated, as in 1885–86, on the injustice to Ulster; but this time Lord Randolph Churchill's phrase of the earlier years, "Ulster will fight and Ulster will be right" was transformed into action. As early as Nov. 1913 armed resistance was in preparation; it was not until March 1914, when some officers stationed at the Curragh sent in their papers rather than face the carrying out of orders which the Government might shortly have to issue, that the public generally woke up to the fact that civil war was at the gates. In April arms and ammunition were being openly landed at Larne and distributed by motor transport throughout Ulster; a "provisional Government" had been organized. During the first stages of the bill in the Commons and the Lords efforts for peace were still being made; the Home Rule bill itself, if it were to obtain the sanction of the Parliament Act, could not be amended; but the Government produced in June a bill allowing Ulster counties to "contract out" of Home Rule. It met with so much amendment in the Lords that there seemed to be no hope at this stage of reconciliation. When it was announced on July 20 that the King had summoned a conference in the privacy of Buckingham Palace, matters were felt to be grave indeed. The graver stage still, when the conference, after four meetings, broke up without having reached an agreement "either in detail or in principle," hardly had time to impress itself on the mind. For on July 28 a Balkan incident, which had been occupying some space in the newspapers, culminated in a declaration of war by Austria upon Serbia, and after a week of suspense, Great Britain was at war herself.

THE WAR PERIOD

This is not the place for even a brief history of the war (*see* WORLD WAR); all that can be attempted is a sketch of the course of events in England and the reactions to them and to the fluctuations of the war in the national mind and temper. The actual moment of the declaration of war, Aug. 4, was in many ways fortunate. Aug. 3 had been a bank holiday; by a proclamation prolonging the closing of the banks for three days and a "moratorium" period suspending for a month settlements in finance, the Government was able to prevent both panic withdrawal of gold by individuals and panic measures in industry and business generally. Then again, the August bank holiday was habitually a time when Territorial troops were "in being" for training; with the least possible friction the Territorial troops could be mobilized, while the Expeditionary force was being transferred to France. Altogether the nation entered more smoothly and more unitedly upon war than could have been thought possible. It was satisfied with the immediate changes in the cabinet; Lord Morley, John Burns and one or two others resigned, and the announcement that Lord Kitchener, at home as commander-in-chief, had become secretary of State for war was thoroughly popular. He appealed immediately for volunteers, and, without much regard to his warning that the war would last four years, civilians poured in to the recruiting offices. The warning was taken seriously by hardly anyone; all other considerations apart, how could a vast European war possibly be financed for more than a few months? The Germans themselves were looking to another swift campaign like that of 1870–71, and the first week of the war seemed to promise it. The news of the retreat from Mons and the anxious days of continued retreat looked as if Paris would be besieged almost before the war had really begun. Then came the turning aside of the German armies, the check at the Marne and the recovery of ground by the French and British troops. And as the hostile lines settled down for the winter, the

first battles of Ypres (*q.v.*) showed the magnificent stuff of the regular army in a way which the public could understand better than it understood the excellence shown during the retreat.

The First Months.—"K's armies" were already armies in numbers, so swift had been the response of youth; and, out-running all conceivable supply of uniform or equipment or camp accommodation, they drilled and route-marched and learned their job as best they could from re-enlisted N.C.Os, of the old army, making light of their conditions. To the making of the new armies the nation added the care of masses of refugees pouring over from Belgium, and the first steps towards the expansion of hospital services in the formation and training of V.A.D. detachments. At first there had been a tendency to panic purchasing of domestic supplies and "food hoarding," but it had rapidly died down. Spy hunting had not been long in beginning; and, as the terrible casualty lists struck home, recruiting posters grew more raucous, and there were soon indications of looking askance at healthy young men not yet in the training camps. There were shocking reports—the worst were later to be proved to have no foundation in fact—of devastated villages in Belgium and wholesale massacres of inhabitants, to which many of the refugees added what was taken as evidence. It culminated, perhaps, in the accounts of the burning of Louvain, with its priceless library; but that was only the most striking of a long catalogue of destruction and slaughter which seared the British mind, and had its part in the stimulation of recruiting. It would, however, be true to say that the hatred had not yet the added sting of fear. The Allied lines were holding; the new armies were constantly growing; the Dominions were mustering great contingents; and there was a profound belief in the enormous strength of Russia, once she could "get going" (the rumour that Russian troops had been seen in England on their way to the western front was one of the most extraordinary incidents of the war in the flat opposition of strongly authenticated statements and downright official denial). The country had quickly become accustomed to the first restrictions of the Defence of the Realm Act, and to the use of Treasury notes of £1 and 10s. instead of gold pieces, which had in the early days of the war been called in to the banks. There was a short recurrence of alarm in November. Hitherto the few scattered naval encounters had been satisfactory on the whole to Great Britain. Then came the news that three cruisers, caught by German ships off Coronel (*q.v.*) in the Pacific, had been sunk. The reply was amazingly swift, and restored confidence in Lord Fisher, the first sea lord. He had instantly despatched battle-cruisers, which in December, at the Falkland islands (*q.v.*), had fallen in with those German ships and destroyed them.

1915.—It was principally an impatience due to lack of understanding of the real nature of the war that accounted for the signs of a less admirable temper in the spring of 1915. It even began to attack Lord Kitchener. The long casualty lists of the winter grew ghastly with the failure of the Neuve Chapelle offensive in March; and then that event began to make known to the people at home—what the troops in the field had long known—that this war was going to demand wholly new conceptions of massed artillery and shell-fire. This, and what appeared to be delay in the use of the new armies, roused a storm of criticism. At about the same time the first use of poison-gas by the Germans in the Ypres section terribly embittered the public mind and roused a new war-spirit; taken in conjunction with the already considerable sinking of merchantmen by German submarines it fitted in with all the reports of ruthlessness in Belgium, to create the sense of an unscrupulous, indeed a savage, enemy. Something was done to steady the British mind by the introduction of a bill in parliament to set up a Ministry of Munitions. Under an extension of the Defence of the Realm Act all factories concerned with munitions had been taken over by the Government in March.

More immediately steadying, perhaps, was the reconstruction of the Government in May; the Liberal ministry was replaced by a coalition including all the Conservative leaders; and Lloyd George's daemonic energy was felt, even by those who had in the past regarded it as a national danger, to be in a good place at the head of the new Ministry of Munitions. Meanwhile, a new phase of the war had been launched by the Dardanelles expedition. The public, knowing little of the divided mind of the Government, in spite of Lord Fisher's resignation from the Admiralty, welcomed it as offering an attack upon the further side of the Central Powers, and as a move to keep the Balkan Powers from intervention.

The heavy casualties of the heroic landing, the drain of man-power, steady and appalling, of the trench warfare in France, roused the nation to a new realization of its task. Compulsory military service was beginning to be discussed in June; but one more effort of a different kind was to be made first, in the shape of the "Derby scheme," under which men registered in groups according to age and their married or unmarried condition, not for immediate enlistment, but for the calling up of groups as required. The sinking of the "Lusitania" on May 7 had aroused the public more than the loss of a good many merchant vessels (incidentally it was hoped that the number of American passengers on board would stir the United States to action); but the summer did bring some concern for food supplies. Since early in the war the Government had more or less controlled sugar supplies; there was now an appeal to everyone who could grow any kind of food to do so, and flower-gardens and lawns gave way to vegetable beds. During the summer and autumn the first Zeppelin raids brought the war home in a new way. Camps and hutments were springing up, housing the first Canadian contingents as well as the home recruit. (Australian and New Zealand contingents had been diverted on their way, to take part in the Dardanelles campaign, and South Africa was using her contingents against the German settlements on that continent.) Women were throwing their power into the war; all over the country they were taking the places of chauffeurs and grooms who had gone; they were working on the land in the place of farm-labourers; they were largely staffing the munition works; and they were establishing and working canteens in camps and factories. Britain was already a changed country when it could hear ministers talking in December of an army of four million men.

Yet, though by now the true character of the war was apparent, and Lord Kitchener's prophecy of four years was beginning to be understood, the great changes were being left, of set policy, as far as possible to the impulse of the nation itself. The belief was that British people rose to a crisis best with as little as possible of statutory compulsion. It was felt that a nation unaccustomed to the military conscription and the far more constant State action in civil affairs under which Continental nations had lived, would suffer rather than gain by a sudden subjection to compulsion. Not only would there be resentment that might become sullen; the effect of drastic State intervention might be to create nervousness and apprehension, instead of the confidence and self-reliance which were needed. In every way, therefore, unusual methods were avoided. The Treasury had set itself to avoid them as far as possible. By steady increase of taxation, especially the income-tax and the duties on alcoholic liquors, and later by the imposition of the excess profits duty it forced up the revenue amazingly; and beyond that it relied during the early years upon votes of credit financed by advances from the banks, rather than upon the launching of any big public loans. The rapid and large increase of currency, which the inconvertible paper basis made possible, swelled banking figures to a point which enabled them to keep the Treasury's quiet policy going for some time. Equally the Government set itself to avoid conscription and food-rationing, which began early in Germany. Throughout the war opinion on this policy was strongly divided, and to the end the British effort remained a mixture of wholly devoted volunteering, and a piece-meal kind of compulsion.

1916: The Man-power Demand.—Throughout 1916 the real heart of the war was seen to be the western front, and it was a year of heavy, deadly fighting. The great defence of Verdun (*q.v.*) lasted from February to June, and the new armies were by now ready to take over more and more of the lines to free French troops for their terrible effort. In July came the British offensive on the Somme. The "tanks" made their appearance in September, heartening the country with the sense that the Germans were not

to be alone in new devices; and to the end of the year trench warfare was constantly active. Inevitably the question of man-power was more urgent. There was much dispute as to the extent of evasion of attestation under the Derby scheme by men of military age, and resentment at the idea that, because of this, groups of the married and older men who had attested would be unfairly called up. The result was the introduction of a conscription bill, applied to all men between 18 and 40, with exemption for those engaged in absolutely necessary national service and those who had a conscientious objection to military service. Local tribunals were set up to grant these exemptions. They were soon to create bitterness of feeling—the casualties were touching so many homes now—and active men without the silver badge, showing that they had served and been discharged as disabled, had no comfortable time. In another way the nation's man-power had its problems. There was an amendment of the Munitions Act, to force upon workshops and factories which still tried to maintain old union rules the "dilution" of labour by unskilled men. This, and the growing fear that the Conscription bill would in effect mean military discipline in factories, led to a serious strike on the Clyde in March and April ignited by revolutionary opposition to the whole war. In finance new efforts had to be made. The country's credit had responded amazingly to the strain; but now, besides the raising of the income-tax to 5s. in the £, increase of excess profits duty and other efforts of the budget, a campaign was started for "War Savings" certificates to include the small investor and spread the fiscal burden. Continuance of the Zeppelin raids brought growing pressure upon the Government for improvements in the air forces.

Twice in the first half of the year the public mind received sudden shocks. At the end of April, armed rebellion broke out in Dublin for a terrible week, followed by many executions on the spot, and months later by the trial and execution of Roger Casement in August for high treason in securing German help for the rising. The rebellion was quite unexpected; Birrell, the chief secretary, acknowledged that the significance of a new influence at work in Ireland had been underestimated. The Home Rule Act had been placed upon the statute book soon after the outbreak of war, but to meet the protests of those who objected to advantage being taken of the abandonment of party strife, it had been accompanied by an act suspending its operation till after the war. Irish regiments had maintained all their old reputation; and little attention had been paid to the new movement of Sinn Fein, until the rebellion made clear how forcefully it had been working in detachment from the old political nationalism (*see* IRELAND: *History*). The other shock came, very differently, in June, when Lord Kitchener, starting to visit the Russian front, was drowned by the mining of the cruiser in which he was travelling. Accusations of treacherous betrayal of his plans lasted for years, so sharp was the effect on the public mind. A great deal of uneasiness was also caused by the one great naval affair of the war, the battle of Jutland (*q.v.*) on May 31; not all the power of the censorship could make it appear a victory. There was, indeed, as the year went on, a growing tendency to wild accusations. Members of the Government were charged with having treasonable sympathies; Lord Haldane, whose reorganization of the military machine had done more than anything else to enable the country to take the first strain of the war, had had to resign from the Government, because much of his education had been in Germany; others, especially Asquith, were charged with an over-tenderness for German prisoners of war. More and more loud, too, grew the complaints that in every direction the attempts to make the nation put out all its strength were being evaded. Khaki was now everywhere, but it was said that it covered a multitude of shirkers. Conscientious objectors were increasingly hounded. The tribunals had been interpreting exemption in such cases from military service to mean exemption from actual combatant service, and not to cover non-combatant enlistment; public opinion, in any case impatient of these exemptions, supported this view. But there were many conscientious objectors who went much further than this; some from deep religious conviction, like the stricter Quakers, and some from violent political opinions, like the extreme Labour men, refused any service connected with the prosecution of the war; and many of them were sent to prison.

Appeals to cut down luxury expenditure and to use food economically, were felt to be so useless that the Government was pressed to introduce compulsory rationing. Labour was accused of putting its old quarrels in front of the national need in striking at such a time; another serious trouble in the south Wales coalfield in November led to the putting of coal-mines under the Defence of the Realm Act, with power for the Government to take them over if necessary. A man-power distribution board was set up in September, with promises of "combing out" all employment at home. Compulsory rationing was refused, but in November the appointment was announced of a food controller with wide powers; the submarine campaign was growing serious. The real response to all the dissatisfaction came in December when Asquith, who had been peculiarly grossly attacked, resigned. Lloyd George became prime minister, with a "war cabinet" of four members—himself, Lord Curzon, Lord Milner and Arthur Henderson—and a Government that included three new ministries—of labour, food and shipping—brought in "business men," and promised a universal national service scheme.

1917: The New England.—With no illusions left on the nature of the war, the country entered upon 1917. It was a strange year. Towns, at first because of air-raids, and later also for the saving of coal, were in complete darkness at night. Food, without actual rationing as yet, was often short, and, with the increase of Government control of supplies and prices, was no longer freely obtainable; restaurant meals were definitely restricted. Alcoholic liquors had been largely given up (the King had set the example at the beginning of 1915), and in munition areas licensing was under strict control. Alcoholic liquors were, in any case, becoming very expensive, with the steady raising of revenue duties upon them; and were deteriorating in strength and quality with the Government control of the materials of manufacture. Yet there was much spending of money, and much rather fevered gaiety. This was partly because the enormous Government requirements had vastly increased the currency and spread money all over the country in high factory pay, military pay, camp and equipment contracts; partly because of the feeling that all the hard work justified the turn to what distraction was possible. A grimmer phase of the same feeling permitted any extravagance to the armies, to the men back from France, or on their way there, hung about with the bewildering mass of trench equipment—gas-masks, entrenching tools, weapons, food-tins, packs—half buried in coats and mufflers, the strange, heroic infinitely patient figures which poured out of and into the leave-trains at Victoria station. So in a tragic England there was dining and dancing and theatre-going as never before. It was only too easy to feel that no one could count on life; the hour must be taken as it came, whatever morality might say. Everyone was extraordinarily free, for home life had come to mean little to the mass of people at war work. Hundreds upon hundreds of thousands, moreover, were earning more money than they had ever dreamed of; and this applied specially to young women. Munition wages were unstinted; there were good pay and keep in the Women's Auxiliary Army corps, and its sister organizations for the air force and the naval air service. Women were as completely swept away from their past as men. They were largely staffing factories and commercial offices, and replacing men on the land; and the vast expansion of hospital work and motor transport absorbed the rest.

Every aspect of life was new, and yet incredibly accustomed. The armies were new, for the men of the old armies were nearly all dead or disabled, or in the higher command; their training was new; the officering was new; the speedy discovery of the terrible costliness of the war in the commissioned ranks had been met by the formation at home of officer cadet battalions to which men from the armies in France were steadily drafted for training; they had never known anything but the new fighting and the command of the new soldiers. Much that the old army valued might have gone; but the new armies understood their job.

There was in 1917 the feeling that the crisis of the war was at

hand, especially with the first important news of the year, the great withdrawal of the Germans to the Hindenburg line. But for the rest of the year events conspired to make a strained fluctuation of hopes. The capture of Vimy Ridge in April had been preceded in March by the Russian Revolution. The third battle of Ypres (*q.v.*) in July, and the capture of Hill 70 in August were followed by the Caporetto (*q.v.*) disaster to the Italian army; and the long dreadful struggle in the mud of Passchendaele in November was followed by Russia's withdrawal from the war in December. The main result at home was renewed agitation about man-power, and pressure upon the Government for a re-examination of discharged men, and for drastic "combing out" of the civil service, of munition works and of other occupations where exemptions had been granted largely to "indispensables," as well as an equally drastic "combing out" of the non-combatant military organization in the back areas in France.

At home life was growing more painful in many ways; yet sweeping measures of control were avoided, mainly with the idea that the less enforced restriction there was, the better for the *moral* of the "home front"; fox-hunting was not abandoned till the spring of 1917, and racing not till later in the year. Thus, although the submarine menace was most alarming in April and May, only voluntary rationing was called for; one special ground for anxiety was that the last potato crop had been very bad. The Germans had announced an "unrestricted" submarine campaign; it was answered by an amazing display of ingenuity and undaunted courage in the "Q ship" anti-submarine campaign. And above all it turned the scale in America; the United States declared war, and began to muster and train contingents on the new war-scale of millions. Without going as far as a full imposition of rationing, the Government steadily increased their control of purchasing and prices. But this was largely due to a violent outburst of complaint about "profiteering." It was not till long after the war that people began to understand that an enormous increase in currency was bound to make high prices, and to enrich many people; at the moment it was all taken as a preying upon the nation's necessities. At any rate, it helped to finance the war; a loan put out in January was subscribed to over a thousand millions; and there was another huge one in October; while excess profits duty and the income-tax were forced up every year. This kind of extensive and heavy diversion to the State of the profits of commerce and industry was seen by Labour leaders as a lesson and an actual hope for the future. And similar hopes appeared in many directions. The control of licensing and the drink traffic; the energetic organization of housing and welfare schemes in munition areas; the reorganization of the railways under Government control; the semi-nationalization of mining and industry; even such a purely internal development as the banking fusions which, in 1917 and 1918, produced the "Big Five," so prominent in the post-war financial world—all this seemed to indicate that the nation might have finished with much ill-organization. An economic conference of the Allies in Paris in June 1916 had outlined large schemes for future co-operation. And in quite a different way, imperialism was becoming a new thing, not only by the presence of great contingents of colonial troops, but by the activities in England, first of W. M. Hughes, the prime minister of Australia, and then of Gen. Smuts, the latter being made a member of the war cabinet in June 1917.

There were several bad strikes during the year—of munition workers at Barrow in March, of engineers in Lancashire in May, of railwaymen in November—partly on "dilution" quarrels, partly on wage disputes. Irish affairs were dispiriting; all attempts to make a *modus vivendi* during the suspension of the Home Rule Act broke down, and there was a growing sense of the control of opinion in Ireland passing from the old leaders to the new Sinn Fein movement. Parliament, indeed, set itself to some constructive work, with a large franchise bill establishing virtually adult suffrage, and, at last, women's suffrage (*q.v.*). A useful education bill was passed. During the summer, raids by squadrons of German aeroplanes, at first on moonlit nights, and then in broad daylight, packed the "tube" railways with refugees, and led to complaints of the insufficient defence of London.

1918.—Although compulsory rationing for some foods came before the end of Feb. 1918, the worst of the submarine menace was over; the combination of successful anti-submarine tactics with a vigorous construction of new shipping was at last balancing losses and replacements. Finance, too, was bearing the strain, for besides successful issues of war bonds and war loan (for which there was another strenuous appeal in February) and the forcing of the revenue up to the unheard-of figure of 842 millions, there had been heavy borrowing from America. At first British requirements from the United States had been financed by the purchase of American securities from private hands; but since the entry of the United States into the war 500 millions had been borrowed. There was another military service bill early in the year, calling up men between 40 and 45, and the "comb-out" was steadily proceeding. Rather grimly by now, but still without the gravest apprehensions, Great Britain settled down to "carrying on," when the news of the very serious German "break-through" in April shook even the most confident. The deduction was obvious; the Germans could not afford to wait for the entry of the American troops, and were making their big effort. For days the balance hung; if they reached Amiens, no one could tell what the result might be. Then the impetus was checked; the distorted Allied lines held once more. But from that time on, there remained a feeling that the crisis must now come. The immediate result was the unified command in the single control of Gen. Foch.

With the sense of the crisis for the armies, the people at home passed under much more restriction. Restaurants and theatres were obliged to close early; the purchase of clothing was regulated; there was restriction of railway travelling; and finally, in July, extended rationing, which now included sugar, butter, margarine, lard, butcher's meat and bacon. These restrictions (though nothing in comparison to the sufferings in Germany) were serious and were causing much anxiety about the children growing up in such conditions, most of all, of course, the children of the homes where poverty was added to rationing. National food kitchens had been opened and were doing much good; rations gave the best results where they could be used in bulk; and the fat ration especially went furthest in this way; so that private individuals began to learn, here and there, to "pool" their preparation of meals. Another service bill called out men up to 50 years of age; the "comb-out" required more and more elderly men to fill up the non-combatant parts of the service; and with this last calling-up it became apparent that there was only the "comb-out" to depend upon now for supplying the wastage of the trenches.

Some events of the summer provoked the question whether even now the country was whole-heartedly at war. The news of another violent German effort in July, this time farther south, which was causing again an alarming withdrawal of the Allies, coincided with the outbreak of another considerable strike in munition works at Coventry, which had spread to Birmingham and into Yorkshire, before the Government's threat to draft the strikers into the army caused it to collapse. There were more strikes in August, including the astounding spectacle of the Metropolitan Police Force itself on strike, for bonus pay, to meet war prices, and for recognition of their right to form a union. Luckily there was a kind of substitute force available. From early in the war men over military age had all over the country been doing excellent service as special constables; and as the needs of the army grew heavier, this force was more and more highly organized and used. It did splendid work in times of air-raid, and gave a new meaning and status to the special constable.

The Armistice.—By the time of these later strikes the public mind, though irritated by them, had very different things to attend to. With an almost incredulous excitement and hope it was watching Foch's reply, so patiently prepared and timed, to the last German attack. By the middle of September the issue could hardly be in doubt; all that remained was the question of how long the final stage could last. There was even now little jubilation. After the long years of war the strain lay too heavily for outbreaks of excitement, and vitality was perhaps a little too low; the ravages of a bad epidemic of influenza, with the deaths rising to nearly 400 a week, seemed to indicate this. Yet when the end

came, the joy and relief had their way. It was known in the first week of November that an armistice was in preparation. At 11 o'clock on Monday Nov. 11, 1918, the bursting of maroons over London (so lately grimly associated with air-raid warnings) brought everyone out, and for the rest of the day and till far into the night the streets of London were packed tight with people and alive with noise. At the very moment when to the troops at the front the strange thing was the sudden silence of an air that for years had never been free of gunfire, to the people at home the strange thing was the unaccustomed volume of sound, in an air where for so long everyone had gone quietly.

The contrast is worth making; for there is this last word to be said in an attempt to depict the mind of Great Britain during this period. Throughout the war there had been, on the whole, a wonderful sense of unity between those at home and those in the fighting forces. Leave had been as well organized and probably as generous as was possible; the postal service had been little short of marvellous. Experience had been shared, as far as it could be. But shared in the real sense it could not be. What "the front" really was, only those who were there knew, or ever will know. And what "home" really was, in the agony and the blind waiting, waiting, waiting, only those who lived through time that was timeless knew, or ever will know. With all the unity there remained a deep unbridgeable gulf. The men of the armies would not have bridged it if they could. They lived their own heroic lives and died their own heroic deaths.

BRITISH HISTORY SINCE THE WAR

The war was over; few people, if any, discerned the dangers lurking in the full play which was given to that feeling. The Coalition Government, precipitating a general election in Dec. 1918, not merely played upon it, but played down to it. Little was before the electors except a loose and far too easy summary of the mind of the moment provided by Lloyd George. Some of it was an idealistic, if rather sentimental, programme of social amelioration to cement the comradeship between classes which, it was hoped, would prove to be one great good amid the evils of war. The rest of it was hasty generalization about bringing to book those responsible for atrocities (it was believed generally that the German emperor, in self-sought exile in Holland, could actually be brought to trial) and about indemnities and reparations from Germany. Loose appeal as it was, it succeeded handsomely. There was to be no chance of a return yet to party divisions; Lloyd George insisted on pledged candidatures, and all independent candidatures were outlawed. In the end Labour, the one party which could afford to defy the outlawry, secured 57 seats; Liberals, as such, secured only 26. Pledged Coalition supporters numbered 484.

The Return to Civil Life.—Lloyd George, departing with the other British representatives, Balfour, Bonar Law and G. N. Barnes, for the opening of the Peace Conference in Paris (*see* PARIS, CONFERENCE OF and VERSAILLES, TREATY OF) which held its first session on Jan. 18, 1919, left to his colleagues the troubles which very soon began to arise. No one, indeed, paid much attention at the moment to the fact that Sinn Fein had not only secured 73 of the 77 Irish seats, with candidates pledged not to come to Westminster, but had also on Jan. 22 opened a "Republican Parliament" in Ireland. There were troubles nearer at hand. Miners' grievances broke out again in a strike, only composed for a time by the appointment of a royal commission in February with orders to issue an interim report as quickly as possible. During that month there was an epidemic of strikes. Worse still, all plans for gradual demobilization were being ruined. Since long before the end of the war the Government, foreseeing the difficulties of returning five millions of men to civil life, had been elaborating plans of demobilization, which included not merely methodical return by classification based as far as possible on the probabilities of the labour market, but also plans for giving to the men held back facilities for education and vocational training, which might compensate them for the delay in their return. But the men in the armies cared about nothing but getting home again, and felt that they had earned the right to return; and this pressure came at a time when industry was suddenly shorn of the fictitious demand for production, and was disturbed by the strikes. There were serious troubles in demobilization camps, some known to the public, since they occurred in England, some not known so widely, since they occurred in France. In the end, demobilization had to be carried out wholesale, and problems of unemployment left to take their chance.

The interest of politicians was centred rather on the Peace Conference at Paris, where a good many hopes were vanishing, than in the progress of home affairs. The public mind was still too much accustomed to the vast demands of war expenditure to pay much attention to the budget; it showed that the National Debt stood at nearly £7,500,000,000, with some £1,500,000,000 of floating debt. The setting up of a Ministry of Transport, and the changing of the Local Government Board into the Ministry of Health suggested that some lessons of organization had been learned (*see* GOVERNMENT DEPARTMENTS), and a housing bill was intended to redeem some of the election promises of better conditions for millions who had served in various ways in the war. A "profiteering" bill, setting up local tribunals to deal with cases of exorbitant prices, was little but a sop to popular outcry. In an autumn session a further stage of experiment in the government of India was entered upon by the act giving effect to the proposals of the Montagu-Chelmsford report; the Enabling Act setting up the Church assemblies was passed; and the first woman member, Lady Astor, took her seat. But the public generally had not much concern for such doings. It was settling back, as best it could, into business and industry, the difficulties being for the moment partly masked by the war gratuities; and it was finding matter for concern in Ireland, where an Irish Republican army was drilling, and where, throughout the autumn, there was a series of murders and murderous attacks by Sinn Fein adherents.

Guerrilla War in Ireland.—Nobody saw the terrible pace at which this was to grow into a situation of almost blind despair. Little else mattered in 1920. The Government were trying to meet the situation in the old way, with a mixture of coercion of disorder and concession to the demand in the shape of a new Home Rule bill, introduced on Feb. 25, setting up two Irish parliaments, one for Ulster and one for the rest of Ireland, with a single "Council of Ireland" to bring about harmonious action. This met to some extent the Ulster difficulty, though the proposal for a single council was mistrusted. It did nothing to meet the Sinn Feiners, who not only refused to accept any partition of Ireland but demanded nothing less than an independent Irish republic. The Government were able to reinforce largely the Irish constabulary with men who had served in the war, and being unable to find civilian jobs were glad to return to active service; they went to Ireland without any of the constabulary traditions, and soon acquired a grim notoriety as the "Black and Tans." Ambushings, kidnappings, raids, marked by merciless killing on either side, with violent street-fighting occasionally in Dublin and Belfast (*see* IRELAND: *History*) seemed to be working up to a bloody climax of English and Irish relations.

With this appalling kind of war on its hands in Ireland, with the rumours of war in Russia, where assistance was still being given to anti-Bolshevik armies, with the incident at Amritsar in the spring, where a threatening Indian crowd had been fired upon in a confined space, with many casualties, the Coalition Government had little on the other hand to satisfy it at home. The country was, indeed, saved from what threatened to be a serious situation in the early summer, when the Trade Union Congress showed an inclination to act in sympathy with the strike of railwaymen in Ireland against handling military traffic, and to forbid the handling of any traffic in England until the transport of men and munitions to Ireland and to Russia was stopped. But it was not saved from a strike of miners in the autumn, as the Government failed to act upon the nationalization clauses of the coal commission's report (clauses, however, which had only been passed on the casting vote of the chairman, Mr. Justice Sankey). Nor was it saved from such an alarming state of unemployment in the winter that parliament had to make hurried grants to enable municipal bodies to undertake schemes of work to absorb labour.

The unveiling of the Cenotaph in Whitehall and the burial of the Unknown Soldier in the Abbey, on Nov. 11, 1920, came at a time when the country was most depressingly aware of what war could do to the whole productive system of a nation.

Decontrol and Its Troubles.—The Irish problem remained for another six months one of bloodshed and anger, with a great deal of fighting in Dublin in March, but the crisis in England began to matter more. The rapid destruction of any real meaning in "money" in Germany and Austria, and the signs that similar currency disasters might conceivably spread to Belgium, Italy and even France, began to have their effect on the British mind. The enormous expansion of revenue was seen as concealing the seeds of these very disasters; it really meant a vast creation of currency. The result was a demand for drastic economy, and the limitation of State action, with its corollary of paid servants, in every direction. "Decontrol" of railways, mines, food and drink, prices and agriculture took place, the last-named involving abandonment of the minimum wage for agricultural labourers. The Coalition Government was giving up every means of that organization of the country for a better national life which had been its appeal to the electorate in Dec. 1919. Large undertakings surviving from the later days of the war, like the huge depot at Slough, were hastily wound up; and in August a committee for economizing in the public service—the "axe" committee—was set up under the chairmanship of Sir Eric Geddes. Decontrol of the railways was, indeed, accompanied by some small remnant of the war's lessons of organization, in an amalgamation of systems which left only four great railway companies. Decontrol of mines, another indication that the old piece-meal struggle was to be left to go on, led to another strike in April and to the calling-out of the reserves, and armed defence of the mines. At the end of June Lloyd George was able to announce a settlement, but he had bought it by a subsidy of ten millions to allow maintenance of wages.

The Decline of the Coalition.—In the latter half of the year Irish affairs took a turn for the better. Negotiations had been opened in May, but many difficulties had to be met (*see* IRELAND: *History*) and it was not until the early days of December that terms of peace were arranged. No small part of the difficulty had been due to an uncompromising attitude on the part of the "die-hard" Unionists in parliament, who maintained their opposition throughout the debates on the ratification of the Irish Treaty. By the beginning of 1922 their opposition had developed into a serious rift in the Coalition. Disagreement arose in Jan. 1922 between Lloyd George and Sir G. Younger (Viscount Younger), the Unionist chief whip, as to the best date for an election, the former again being for precipitation; and the rise of a discussion as to the distribution of political honours, alleged to have filled an electioneering war-chest which was under Lloyd George's control, hastened the desire to draw the Unionist Party clear. The year 1922 becomes, therefore, a tale of the decline of the Coalition. There were other influences at work, besides Unionist disaffection. Inflated revenue figures were coming down, and budgets, instead of being balanced at 1,400 or 1,200 millions, were down to 900 millions or so, with the consequences of a shrinkage of currency and a fall in prices; the index-figure of the cost of living had dropped from the highest peak of 176 to 92. The fiscal severity, however, meant not only drastic cutting down of the public service, but the abandonment of any really generous assistance for housing and little prospect of much more subsidy for work for the unemployed. Reparations from Germany had never meant quite as much to the British people as to the French; but as it became more and more apparent that they would have to shoulder the whole burden of their war debt, and could look for little or no relief of taxation, it did the Coalition no good to have made promises which now, they had to explain, had always been futile. The failure of the Genoa Conference (*q.v.*) to "settle Europe" was followed by a period of real tension between Great Britain and France over the operations in Asia Minor which ended in the complete rout of the Greeks by the Turks. A Coalition which could give no fruits of peace at home, and seemed actually to risk peace abroad, had reached the end of its tether. Moreover, there had been growing a strong feeling that the power, and especially the electioneering power, behind the Coalition was speculative capitalism. This was what gave sharpness to the charges about the sale of party honours. It has been remarked that the general public never understood the true economic reasons for the rise of prices, but attributed it mainly to profiteering. Similarly they did not now understand the economic reasons for cutting down budget figures, or for lightening the excess profits duty while leaving other duties unaltered. Again, it merely looked as if the "profiteer" were able to secure terms for "big business" at the cost of schemes for housing and relief of unemployment. The war with Bolshevik Russia could be regarded as an expensive affair undertaken for the financiers whose loans had been repudiated. The troubles in Asia Minor were openly put down to the scramble of oil interests for territory to exploit. The Genoa Conference was thought to have failed—even, by now, the Peace Conference at Versailles was felt to have declined from great ideals—because high finance alone had national and international politics in hand. And a pledge-bound Coalition House of Commons, lacking the normal party strife in which truth may sometimes emerge, was accused of being the ideal instrument for influences that preferred to be unobserved.

The Return to Party Politics.—Lloyd George resigned on Oct. 19. There followed a curious period of political history. The King sent for Bonar Law, who in March 1922 had resigned his post in the Coalition Ministry on the ground of ill-health. Austen Chamberlain had, since then, led the party and the House of Commons; but the Coalition in which he served having resigned, Bonar Law was the only possible leader to send for. The position was, in a sense, regulated by his election as their leader on Oct. 23 by a Unionist Party meeting of Lords and Commons. This, however, implied that the party was determined to return to normal political conditions whether the strong group of its chiefs in the late Coalition Ministry liked it or no. In fact, they nearly all held aloof. The sound instinct of the Unionist move was clear from the election results. Although, owing to triangular contests increasing largely in number from the existence of two Liberal groups and a rapid increase of strength in the Labour Party, those results were a somewhat distorted representation of the voting, the Unionists returned 347 strong, confronted by 159 Labour members, 59 Coalition Liberals and 60 Independent Liberals. So in the least democratic of parties a rank-and-file movement met with success.

The Ruhr and Reparations.—The new Government had almost immediately to deal with a grave turn in our relations with France. To the French, as has been remarked, with their terribly devastated regions, reparations from Germany had always been a much more urgent subject than to the British; and they were moved by no argument of economists on the subject. On the ground that some form of coercion must be applied to Germany, France proposed to occupy the Ruhr (*q.v.*) district of mines and metal-works, and expected the active co-operation of Great Britain, which the Government, wholly mistrusting alike the wisdom and the use of such a step, could not offer. Conferences in Paris in December and January ended simply in leaving France a free hand, as amicably as might be in face of French anger at this "betrayal" of the alliance. Stanley Baldwin, the new chancellor of the Exchequer, was in America early in the year to negotiate the funding of Great Britain's debt to the United States. It stood now at 978 millions, and was funded with the interest fixed at 3% for the first ten years and 3½% for another 52 years, with a sinking fund of ½%. Baldwin's first budget, actually with a surplus of 100 millions, expenditure being now down to just over 800 millions, enabled him to make the first slight reduction in the income-tax; and good sense approved of his application of the surplus to debt reduction rather than to any considerable lightening of taxation. The Unionist Government applied itself mainly to the further securing of our finances in a Europe of uneasy currencies; the French franc was showing signs of a bad fall. Unemployment displayed itself in the "hunger march" from the north in January; and grievances of ex-service men in particular roused a stormy debate in the Commons in April. In the following month the Government had some bad days over the question of men deported to Ireland; an act of indemnity had to be passed to save the home secretary

from his breach of the Habeas Corpus Act.

Otherwise the session passed mainly in debates on finances, reparations and the Ruhr occupation. The most hopeful event of the session was, perhaps, the announcement that a new conference on reparations was in prospect, in which America would co-operate. This latter fact was full of promise; if America, with her financial power, was consenting to abandon her aloof attitude, much might be achieved; but, besides this, the phrase implying that the conference might even amount to an "overhauling of the Versailles Treaty" especially suggested hopefulness, for only a new basis of understanding could bring France and Britain together again. Lord Curzon had some meetings with Krassin, a Soviet representative, with a view to better establishment of trade relations with Russia; but it was a precarious question; a very little while before these meetings the British Government had been protesting against the carrying on by the Soviets of political propaganda under cover of the trading agreement.

The Protectionist Election.—The whole session indicated that the Government, while making provision for relief works, were mainly listening to the economists, and trying, by ending the uncertainties of reparations and in other ways, to re-establish busy markets as the only real remedy for unemployment. There was the more surprise when, during the autumn, Baldwin (he had become prime minister in May, on the resignation of Bonar Law, whose ill-health had become so serious that he died in the following October) suddenly announced that Protection was the way to fight unemployment. The suddenness must not be exaggerated. Baldwin had been prominent of late years in welcoming and extending wherever possible the import duties on manufactured goods which had from time to time been imposed under the financial strain of the war. The process had begun with some duties resulting from the Allied economic conference in 1916; and others had been imposed since. That these steps had not been unobserved is shown by the fact that Bonar Law, to avoid awkward cleavages in the late election, had had to promise not to introduce any general protection during the existence of that parliament. In one sense, therefore, there was nothing very surprising in Baldwin's announcement; but the hint soon after from his chancellor of the Exchequer that the Government would have to seek release from Bonar Law's pledge revealed a completeness of protectionist purpose which certainly had a sudden appearance. A very large section of the Unionist Party felt it to be little short of wanton to risk throwing away, after a single year, an excellent majority, especially when a certain amount of tariff reform by instalments had been proved to be possible. Nor were they less disgruntled when it began to be plain that leaders were not at one; Baldwin, fresh from an Imperial Conference (*see* BRITISH EMPIRE) was insisting mainly upon imperial preference without taxation of staple foodstuffs; and Chamberlain was objecting to any limitation of protectionist policy. But for all the party discontent, Baldwin took his way, and dissolved parliament on Nov. 16. He relied, to a great extent, on divisions in the Liberal Party. He relied, too, on the fact that the Labour Party was entering the campaign with a capital levy in its programme, which would alarm the country. Yet in the end such calculations did not save the Unionists from the loss of their majority. They returned only 258 in number, against 191 Labour members and 158 Liberals.

The First Labour Government.—Again political history entered upon a curious period. Here were three parties, no one of them in a majority. At the very moment when cabinet responsibility was beginning to recover from the drugged years of the pledged Coalition, a new problem in cabinet government presented itself. But all this mattered much less than the other new experience for Great Britain—the first Labour Government. In face of the Liberal weakness at the last two elections Labour had for four years claimed to be the official Opposition; and they were still outnumbering the Liberals. There was some hope that the Liberals might not be inclined now to help Labour to power; unless they did, Baldwin could carry on. But Asquith dashed such hopes when the new parliament met in Jan. 1924; he announced that he and his supporters would vote for the Labour amendment to the Address. The Government was defeated, Baldwin resigned, and on Jan. 22 the King sent for Ramsay Macdonald. Nine months of office disposed quite sufficiently of doubts whether "Labour could govern." Its ministers not only did well in public, but also earned the good will of the departmental staffs. They had some advantages not of their own making; the revenue returns gave Philip Snowden (chancellor of the Exchequer) a surplus of 43 millions; the Reparations Conference produced in April the "Dawes Plan," (*see* REPARATIONS AND THE DAWES PLAN), which in every way opened up the better prospects that had been hoped for. And on quite another plane, the Wembley Exhibition distracted a public which had of late had only too much seriousness. The Government set itself to work within the sober limits which its position as a minority government imposed; it had no great assurance of Liberal support. The budget, on an expenditure of 790 millions, made no "socialist" proposals. An unemployment insurance bill was also far from initiating strong measures; and the housing bill, if it revived vigorously a policy of subsidies which had lately been more and more drastically curtailed, at least made no very excessive demands. But it never became law. The Government was always on sufferance, and the announcement of its Russian policy brought the sufferance to an end. Ramsay Macdonald, who had courageously, if not altogether wisely, taken the Foreign Office as well as the premiership, had immediately opened negotiations with Russia in a new spirit. In July the results were announced in the form of a treaty, in which, besides the arrangements for trading facilities, there appeared a limited recognition by the Soviets of the debts of the tsarist regime, but in return for this a British loan to the Soviets was to be arranged. While there was much to be said for access to the Russian market, there was still too much distrust of the Soviets to permit of such a treaty. Their propaganda was feared; their promises were not believed. The matter remained in suspense during the summer recess; it reappeared at once in the autumn session. But another question had also arisen by then—the dropping of the prosecution of a Communist journalist, accused of tampering with military discipline. In the end it was on this issue that it was decided to defeat the Government. It fell early in October and Macdonald dissolved parliament.

The Zinoviev Letter.—In any case it is probable that the Unionists would have secured a safe working majority, but in the end they secured a majority beyond all calculations. A few days before polling day there was published in a newspaper the notorious "Zinoviev" letter—a document alleged to have been attached to a Soviet communication to the Foreign Office, inciting disorder in Great Britain in the interests of international Communism. The bombshell did its work; middle-class voters were thoroughly scared into belief in an imminent "Red" peril. The Unionists returned 413 strong, against 151 Labour members and 40 Liberals. Liberals, in fact, suffered more from the Zinoviev letter than Labour; their less stalwart adherents either resented the fact that a Liberal vote had put Labour into power, or felt that a three-party balance must not occur again. Labour, on the other hand, had rallied strongly to the denunciation of the letter as an electioneering trick. Analysis of the voting showed that the Labour poll had actually gone up by a million, while the Liberal vote had declined by a million and a quarter. The production of the letter raised two hotly disputed questions—that of its authenticity and that of the method of its publication. Ramsay Macdonald's own utterances were somewhat bewildered. Immediate enquiry by his successor at the Foreign Office, convinced Austen Chamberlain of the authenticity. Information not available at the time, but at Baldwin's disposal in March 1928, when the subject was raised again in connection with an investigation touching the conduct of certain individuals in the Foreign Office, proved that copies of the letter had been sent elsewhere than to the Foreign Office, and that its publication had not been due to improper communication of an official document. But it affected more than the election; Chamberlain at once put an end to the Russian treaty negotiations.

1925: The Coal Crisis.—Great Britain at the beginning of 1925 offered no very cheering spectacle to a new Government. In many directions there seemed to be no lack of money. If there was some tendency among the older county families to give up great expensive mansions there seemed to be plenty of other peo-

ple to take them. Moreover, an enormous increase in the less expensive types of motor-car, a move out to more and more pleasant country suburbs, the maintenance of undiminished numbers at public schools and universities in the face of increased costs, showed that the professional and middle-classes also could command money. Lower still in the scale of expenditure, crowded charabancs in holiday time, a tendency everywhere to expect some kind of summer change, abounding prosperity of cinemas and the pullulation all over the poorest parts of towns of "wireless" aerials, showed a command of money among the mass of industrial workers. And yet unemployment was still showing figures well over a million; business men and manufacturers were gloomy; the labour world restless and aggressive. The Government certainly set out to combine fiscal purity with direct social ameliorations. The budget was notable for the return to the gold standard—a very strong assertion that continued budget balancing, even if a heavy burden to the taxpayer, had at any rate conclusively saved our currency and credit. With the budget came the promise of a considerable extension of the benefit of pensions, the old age pension to be granted at the age of 65 instead of 70 and widows of insured men to be pensioned without waiting for old age. The granting of the insurance pay to the unemployed was, however, stiffened up somewhat by insistence on a minimum number of contributory payments to qualify for receipt of the pay. Discussion of the Geneva Protocol—an attempt at an all-round international guarantee of security which the British Government felt to be likely to commit the country to far too vague and perilous responsibilities —occupied much time; and the pensions bill, when it appeared in May, was debated at great length, as being another "burden on industry."

But throughout the year the real concern lay outside parliament. There were clear signs of a very serious national crisis approaching. The immediate danger-point was, as for so long past, the coal-mines. There was another wages dispute in the summer, the owners giving notice of a reduction; and the Government's appointment of a court of enquiry was met on the miners' side by refusal to consider possible reduction as a subject of enquiry at all. But behind this far greater shadows were looming. A. J. Cook, a leader of the miners, had early in the year been talking of a wide alliance of all labour to back their claims; and this only put into words an uneasy sense that labour and capital were massing opposite one another as never before. How deep the alarm was, and at the same time how perilously responsible people were making up their minds to a fight, was shown in Nov. 1925, when the Government announced a scheme of an organization to deal with essential services in time of emergency. Commissioners, with the necessary staff, were to operate in ten districts into which the country was to be divided, to maintain, with volunteer aid obtained through "recruiting centres," transport, postal services and the supply of food and coal. The truth was that the mining troubles showed no signs of a likely solution. Another coal commission had been appointed in September, under the chairmanship of Herbert Samuel; and quiet was being preserved for a time by the continuance of a subsidy for keeping up wages. But the subsidy would end in April at latest; it was far too costly to renew after that; and yet no one hoped much from the commission's report. The issue between miners and mine-owners was too fundamental. On the one hand mine-owners could prove that, with a loss of markets during the World War which threatened to be permanent, and with the rising costs of working and transport, the industry was not paying its way. The miners' reply was that the real trouble was the wastefulness of piece-meal ownership, the struggle of small, poor mines and the selfishness of big rich ones; and their demand was for nationalization, or, pending that, such a pooling of mines as would, by throwing the returns of rich mines into the common stock, enable the poorer ones to keep up the wage-level. On that issue there was not the faintest hope of agreement.

1926: The General Strike.—Little else mattered in 1926. The narrative can go straight to the presentation of the commission's report on March 10. It recognized that the parlous condition of the market necessitated some new arrangements between the two sides, calling especially for some sacrifice on the men's part in longer hours of work on a smaller wage minimum. But it recommended that wage agreements should be national, and suggested large reorganization of the industry; and contemplated some degree of State ownership in certain circumstances. The Government immediately professed a readiness to act on the report, even against some of its convictions, if the two parties concerned would agree. They could not. The mine-owners posted late in April their new wage offers, which the miners described, and acted upon, as lock-out notices, and on April 30 the stoppage began. On May 1 the Government proclaimed a state of emergency, thus bringing its scheme of November into operation. The instant reply from Labour was the ordering of a general strike to begin at midnight on May 3. Last-minute efforts were made, and Labour leaders were in consultation with ministers when the negotiations were abruptly broken by the latter because a strike had broken out in a newspaper office; compositors had refused to set up a certain leading article on the situation. The ministerial view was that this was treachery to the whole basis of the negotiations; the Labour view was that a small and really isolated incident had been seized upon and magnified because now that war had been declared there were too many on the side of capital who were ready to fight it to a finish. So the strike began. (*See* GENERAL STRIKE.)

For a day or two there was intense anxiety; newspapers could not be published, and no one knew how near the country might be to armed conflict. Then the tension slightly relaxed: an official organ called *The British Gazette* was published daily, and one or two newspapers managed to issue themselves in much diminished shape. Not that their contents tended to a peaceful state of mind; the relaxation of tension was mainly due to the good spirit shown in spite of these publications. The response to recruiting for the maintenance of the four essential services was rapid; and as, on the whole, youth brought to its strange tasks the enjoyment of novelty and a good temper, there was far less friction than might have been expected. Amateur railway work and amateur driving of trams and buses was attended by more hilarity than ill-feeling, though there were occasional ugly incidents. The enlistment for the work of special constables was the most dangerous part of the scheme; youth was not in its place there. The Government's refusal to support in any way an appeal to the nation by its religious leaders on May 6 had an uncompromising look; the mustering of large food convoys in the London parks was accompanied by some conflict; and it was obvious that tempers which could stand a short strain might break under a long one. Fortunately it was not long. On May 8 the prime minister broadcasted a conciliatory message; negotiations were opened, and on May 12 the general strike was called off. It had not been whole-hearted, and it was showing signs of crumbling. But the original dispute in the mines remained as it was, and the stoppage of work dragged on for months. With a budget that again, after the better years, was showing a deficit, due to the mining subsidy, and with business generally bad, even the strong old industries like cotton and steel being in distress, there would, but for the feeling that Labour had "put itself out of court," have been a more healthy pressure upon both sides. As it was, the mine-owners held out for their whole position; and the miners, resentful of the collapse of the general strike and therefore little inclined to heed criticism or advice from the rest of the labour world, stuck to their own extremists. Yet collapse came upon them too. By September a drift back to work had begun, slowly at first, but increasing week by week, in spite of the leaders' efforts, until by late in November half the men at least had gone back. Surrender came on Dec. 1, when the stoppage was declared at an end.

1927.—There remained the aftermath of the general strike and the only question was how serious it would be. Financially, it was bound to be grave; the chancellor of the Exchequer put the total loss at 59 millions, and he had to budget for an actual deficit of 36 millions. He had now to help him the chances offered by the Safeguarding of Industries Act, which had been passed in Dec. 1926, and the betting tax which, imposed by the previous budget, had only become operative in November; this tax was soon to meet with unexpected complications in the sudden craze for greyhound racing. Nothing could be done to lighten the burden of taxation.

Politically, too, the aftermath looked grave. The Government introduced a Trades Disputes bill, making a general strike illegal, and intimidation and threats illegal, with such definition as was possible of the meaning of the words; and, further, altering the basis of the trade union levy. The Osborne judgment in 1909 had laid it down that a trade union had no right to spend money in financing the Labour Party, and as a result a compulsory political levy on members was impossible. The Liberal Government in 1913 had passed an act the effect of which was to allow a levy, but to permit members of the union to "contract out" of it. This principle was now to be reversed, and no levy was to be made except upon members who "contracted in." Regarding the whole bill as the triumphant outcome of the past year, the Labour Party opposed it tooth and nail, and the debates were prolonged, but it passed into law before the summer recess. Happily a year which began with the open hostilities of the Trade Disputes bill ended in the acceptance by the general council of the trade unions of an invitation to send accredited representatives to discuss, with representatives of groups of employers, the vital aspects of a modern industrial community. An unemployment insurance bill, and a bill to foster the production of British cinematograph films were also passed. In this year also broadcasting in Great Britain passed under Government control.

Foreign affairs occupied a good deal of the session. A defence force had to be sent to protect British residents in the disturbances which had become more widespread and threatening in China. The trade agreement with Russia was broken off, after a raid upon a London office-building which revealed evidence of political activities, again under cover of the trading agreement. There was considerable discussion, too, of matters arising out of the League of Nations. Naval expenditure had been coming heavily upon budgets which, in every other direction, were being cut down; and the fact aggravated the failure of the Disarmament Conference in the summer at Geneva. It appeared to have broken down largely from imperfect diplomatic preparation beforehand between Great Britain and the United States. However, the great impression made by Sir Austen Chamberlain's speech at Geneva, on the proposal to revive the Security Protocol—an impression of truth and sincere plain-speaking—maintained the vitality of interest in the League. (*See* DISARMAMENT.) An incident of the very end of the year—the rejection by the House of Commons of a proposed new prayer book, presented to it by the convocations and Church assemblies under the Enabling Act of 1919—was chiefly remarkable for the quite unexpected public interest aroused in matters of doctrine and religion.

1928.—But it was an interest which showed that religious controversy must still turn on very deep-seated historical prejudices. A second attempt, in which some endeavour had been made to compromise with opposition (mainly in modification of the proposals for reservation of the consecrated elements in Holy Communion), met with a similar fate in May 1928; and as the compromise proposals had alienated some of the support of the proposed new book, the attempt to adjust the forms of 1662 to the practices of modern times ended in a failure, mainly regretted, perhaps, by the ordinary individual as a disappointment to the aged archbishop of Canterbury, who had hoped thus to crown 25 years' direction of the Church of England which had, especially of late years, brought him a steadily increasing reputation for statesmanship. His resignation was shortly afterwards announced.

The session showed no failure of vitality in the Government, for its main piece of work was a budget of first-rate importance. The finance of English local government, a piecemeal growth out of petty parochial circumstances, was for the first time envisaged nationally in the light of modern industrial and social developments; and proposals were made in the budget which, by transferring in the course of two years, much of the responsibility for local government finance to the Treasury, would, it was hoped, remove from industry the burdens of an old "rating" system which had become inequitable in its operation.

The problem of the coal-mining areas passed into a new phase of sober common-sense. It was becoming obvious that, from loss of markets and from the inability to work some of the mines on a proper economic basis, the mine-fields could no longer support their old population. The Government, therefore, set up an industrial transference board to find employment in other industries, with some provision for vocational training if necessary, for men who could be absorbed elsewhere; the most striking early success of the Board was in arranging with the Canadian authorities for the employment as harvesters of more than 8,000 men, many of whom, it was hoped, might find permanent work in the Dominion.

During the summer there was a steadily growing interest in a draft treaty, originated by F. B. Kellogg, President Coolidge's secretary of State, aimed at the renunciation of war as a normal feature of international relations. It was eventually signed in Paris on Aug. 27 by several great Powers, including Germany, the adhesion of the other Powers at a later date being hoped for. While it could no more than any other international document make war really impossible, it was nevertheless felt to mark a real advance as the most specific and deliberate declaration that war was no longer to be considered by civilized nations as a recognized implement of their ends. (R. H. GR.)

An Anglo-French compromise on the limitation of naval armaments, announced on July 31, was prematurely revealed in the Press, and at once subjected to severe criticisms—especially from the Government of the United States, which in a note of Sept. 29 refused to accept its terms. At home the autumn municipal elections showed a marked advance for the Socialist Party. Parliament was mainly concerned with the progress of the Local Government Bill. The year closed in an atmosphere of anxiety, caused by the seriously increased distress in the mining areas, and the prolonged illness of the King, necessitating the return of the Prince of Wales from East Africa and the appointment of six counsellors of State to act for the King in the transaction of the necessary business of State. By the beginning of 1929 His Majesty had begun to show signs of recovery, to the relief of the whole nation, which had been roused to remarkable demonstrations of sympathy and affection. (X.)

SOURCES AND AUTHORITIES FOR ENGLISH HISTORY

In this brief section it is impossible to attempt more than three things, viz.: (1) to indicate the nature of the chief sources of English history; (2) to mention the leading authorities in which the evidence derived from these sources is examined and formulated; and (3) to point the reader to fuller bibliographies where the sources and authorities relating to either the whole or part of English history are treated in detail. Since the materials on which our knowledge of the earlier periods of English history is based differ radically from the materials which give us our information concerning the later periods, it is necessary, for purposes of classification, to divide the story of southern Britain and its people into chronological sections, and to deal with them individually in turn.

1. Pre-Roman.—Our knowledge of the incalculable ages prior to the Roman Conquest during which the land now called England was inhabited, is derived almost entirely from the remains which the primitive inhabitants left behind them. These consist in the main of earthworks and burial-mounds, of monuments such as Stonehenge and Avebury, of flint or bronze implements and weapons, and of bone and other tools. Human relics also have, in some places, survived; of these the most notable is the Piltdown skull, discovered in 1912, considered by experts to be not less than 100,000 years old. The most convenient summary of the approved results of archaeological research respecting this period is provided by D. A. Mackenzie's *Ancient Man in Britain* (1922).

2. Roman.—The most considerable references to Roman Britain are to be found in Caesar's *Gallic War;* Strabo's *Geography;* Tacitus's *Agricola, Histories,* and *Annals;* Suetonius's *Lives of the Caesars;* Dion Cassius's *Roman History;* the *Itinerary of Antonine;* Ammianus Marcellinus's *History* (A.D. 353–378), and the *Notitia Dignitatum.* The relevant passages from these and other less important Latin writers are usefully collected in the one and only volume of the *Monumenta historica Britannica* (1848), edited by Henry Petrie and John Sharpe. For the Roman occupation of Britain, however, literary sources are supplemented, and

to some extent superseded, by archaeological evidence. Summaries of this evidence will be found in F. Haverfield's *Romanisation of Roman Britain* (4th ed., 1923); B. C. A. Windle's *Romans in Britain* (1923); R. G. Collingwood's *Roman Britain* (1923); and G. Home's *Roman Britain* (1927).

3. Anglo-Saxon.—For the Anglo-Saxon conquest of southern Britain there are four main literary sources, viz.: Gildas's *De Excidio Britanniae,* Nennius's *Historia Brittonum,* Baeda's *Historia Ecclesiastica,* and the *Anglo-Saxon Chronicle.* None of these is contemporary, and the two former are very scanty. Nineteenth century historians, such as Freeman and Green, constructed their narratives of the coming of the English almost wholly on the basis of Baeda and the *Chronicle.* Archaeology, however, reinforced by ethnology and philology, has compelled criticism of these sources; the stories of Hengist and Vortigern, of Cerdic and Cynric, of the process of West Saxon conquest, and many others, are called in question. For statements of new views, *see* H. M. Chadwick, *Origin of the English Nation* (1907) and E. T. Leeds, *Archaeology of the Anglo-Saxon Settlements* (1913). For the story of the English people from their first settlement till the Norman Conquest, the *Anglo-Saxon Chronicle* remains the primary source; it is authoritative and invaluable from the time of Alfred. It is supplemented by a number of minor chronicles, such as Asser's *De Rebus Gestis Alfredi,* Ethelweard's *Chronicon,* and by numerous imaginative *Lives of Saints.* For constitutional history the large collections of Anglo-Saxon Laws and Charters are indispensable. The best edition of the former is F. Liebermann's *Gesetze der Angelsachsen* (1898 *seq.*); for the latter, either J. M. Kemble's *Codex Diplomaticus Aevi Saxonici* (1839–48) or B. Thorpe's *Diplomatarium Anglicum* (1865) may be consulted. A useful selection is provided by F. L. Attenborough's *Laws of the Early English Kings* (1922).

4. Mediaeval.—The main sources for the history of England from the Norman Conquest to the Battle of Bosworth can be classed under the two heads, chronicles and records. The most important and valuable of the chronicles are those which, in the form of annals, were compiled in the great monasteries, and of these easily the best are those which emanated from the abbey of St. Albans, *e.g.,* Roger of Wendover's *Flores Historiarum,* and Matthew Paris's *Chronica Majora* and *Historia Anglorum.* Monastic chronicles form a large proportion of the 235 volumes known as the Rolls Series. A popular account of them will be found in James Gairdner's *Early Chroniclers* (1879); fuller and more critical estimates are provided in C. Jenkins's *Monastic Chronicles and the Early School of St. Albans* (1922), and R. L. Poole's *Chronicles and Annals* (1926). Besides the monastic chronicles, there are a few written by secular clergy, *e.g.,* Henry of Huntingdon's *Historia Anglorum* and Roger of Hovenden's *Chronica.* Towards the close of the middle ages city chronicles began to be compiled by laymen; those of London are particularly valuable as sources of information (*see* C. L. Kingsford's *English Historical Literature in the Fifteenth Century* [1913]).

The records—that is to say, official documents, financial, legal, administrative, and legislative—are legion and to those who can interpret them they are sources of information unique in authority and significance. First in order of time comes the famous *Domesday Book* compiled as a geldbook by order of William the Conqueror; then come the *Pipe Rolls;* and, after these, innumerable *Court Rolls, Plea Rolls, Year Books, Patent Rolls, Close Rolls, Charter Rolls, Hundred Rolls, Rolls of Parliament,* and others too numerous to mention (*see* S. R. Scargill-Bird's *Guide to the Public Records* [3rd ed. 1908] or the more extended guide in process of publication under the editorship of M. S. Giuseppi). Towards the close of the middle ages, chronicles and records are supplemented by letters, such as the *Paston Letters* and the *Stonor Letters;* by *Political Songs;* and by literary works such as the writings of Wycliffe, Chaucer, and Peacock. For the whole course of English history up to 1485 the student should refer to Charles Gross's admirably complete and well-arranged *Sources and Literature of English History* (2nd ed. 1915).

5. Tudor.—In the Tudor period several of the mediaeval sources of information cease to be available. For example, the chronicles dwindle away, giving place to formal histories such as Herbert's *Henry VIII.,* or to biographies such as Cavendish's *Life of Wolsey.* The records, moreover, change their characters. The *Rolls of Parliament* develop into the *Journals of the House of Lords* (1509) and the *Journals of the House of Commons* (1547). Further, the *Statutes of the Realm* for the first time become of primary importance, English superseding French as their language from 1485. But the immense increase of the power and competence of the central government under the Tudors involves the appearance of enormous new classes of official documents which soon dwarf the old ones in historical importance. These are, for the most part, included under the title *State Papers,* consisting primarily of correspondence of the government with its agents at home, or with its representatives abroad. These invaluable sources of knowledge are stored in the Public Record Office. Calendars, in two great series, one domestic, the other foreign, containing summaries of the more important information, are in rapid course of publication by His Majesty's Stationery Office. The series for the Tudor period is fairly complete. Besides the documents in the Public Record Office, however, there is a rich store in the British Museum. Many important collections of papers, moreover, exist in private hands, *e.g.,* the Cecil manuscripts at Hatfield House: good work in making the contents of these collections known to students has been done by the Historical Manuscripts' Commission, whose Reports are a mine of historical wealth. In the Tudor period, too, the Law Reports, beginning with Keilway's *Cases,* become regular sources of knowledge; they take the place of the mediaeval *Year Books.* It should be noted, moreover, that with the spread of printing, collections of historical materials, such as the *Chronicles* of Fabyan, Hall, Grafton, and Holinshed, popularized the study of history, provided writers like Shakespeare both with subjects for their works and with understanding audiences, and handed down to modern readers useful books of reference respecting mediaeval legends.

6. Stuart Period.—In addition to the sources specified for the Tudor period, the following may be noted. The struggle between monarch and parliament gave rise on the one hand to numerous unofficial reports of debates in parliament and to parliamentary diaries, and, on the other hand, to an enormous pamphlet literature. It is estimated that between 1640 and 1660 no fewer than 25,000 pamphlets were printed and circulated. Of these, two extensive collections are contained in (1) the *Harleian Miscellany* (1808–15), and (2) the *Somers Tracts* (1809–15). Numerous memoirs and autobiographies now begin to throw sidelights upon the course of history, *e.g.,* Gilbert Burnet's *History of My Own Time;* Clarendon's *Life,* and the famous *Diaries* of Samuel Pepys and John Evelyn. Contemporary biography, too, is valuable: *e.g.,* P. Heylyn's *Life of Laud,* and Mrs. Hutchinson's *Memoirs of the Life of Colonel Hutchinson.* Further, the letters of eminent men, such as Temple, Marvell, Halifax, and Sidney, are now available in large quantities, and mainly in printed and well-edited editions. Towards the end of the Stuart period, in the reign of Anne, the periodical literature, *e.g.,* the *Spectator,* becomes important.

7. Hanoverian.—In dealing with the period from 1714 onward the main difficulty is embarrassment of riches. All the official sources—statutes, state papers, journals, reports, etc.—are present in overwhelming masses. In addition, large and important collections of private papers exist, *e.g.,* the Newcastle papers in the British Museum. Much published correspondence also is accessible, *e.g.,* Lord North's correspondence with George III. The periodical literature is immense; to the magazines are added the files first of weekly, then of daily, newspapers. In 1759 the *Annual Register,* an invaluable record of contemporary events, began to appear. After the vindication of the publication of parliamentary debates in Onslow's case (1771), reports of speeches in the two houses became fuller and clearer. Before the end of the eighteenth century Cobbett's *Parliamentary History* supplied the fullest information: in 1803 it was merged in Hansard's *Parliamentary Debates,* the quantity of which leaves nothing further to be desired. Political writing continually increases in

importance as the Hanoverian period advances: the writings of Swift, Defoe, Bolingbroke, Johnson, "Junius," and Burke, are historical sources of prime interest.

8. Modern Period.—Of the sources for the period dating from the accession of Victoria to the present day, little need be said. All the materials which serve for the 17th and 18th centuries continue to exist and to increase in bulk; although, of course, for very recent times not all of them are yet accessible to the historical student. The main addition to the older sources is the long and valuable series of *Blue Books* and other Government publications, the fruits of special enquiries made by various committees and commissions. For the list of these the student should consult the *Catalogue of Parliamentary Papers 1801–1900* issued by P. S. King and Sons. The newspaper sources of information for the 19th century are made the more readily discoverable by the index volumes of *The Times* which run from 1803 onward.

Such, in briefest outline, are the principal original sources for the history of England. When we turn from these to the authorities by whom they have been used and in whose works they have been put to the best account, all that can here be done is to direct the reader to a few bibliographies where detailed information can be found. First, and most convenient, are the appendices to the twelve volumes of *The Political History of England,* edited by W. Hunt and R. L. Poole, and published by Longmans and Co., and the appendices to the seven volumes of *The History of England,* edited by Sir Charles Oman, and published by Methuen and Co. These may be supplemented by selected bibliographies in the *Cambridge Mediaeval and Modern Histories.* An older, but still serviceable, guide is S. R. Gardiner and J. B. Mullinger's *Introduction to the Study of English History* (3rd ed. 1894). The biographical articles in the *Dictionary of National Biography, The British Museum Subject Index* (covering acquisitions 1881-1925) and Sonnenschein's *The Best Books* (Part III., 1923) should also be consulted. Finally, mention should be made of the excellent bibliographical leaflets published by the Historical Association (22, Russell Square, London), and to the *Annual Bulletins of Historical Literature* issued by the same body since 1911.

(F. J. C. H.)

ENGLISH LANGUAGE. It is usual to divide English chronologically into three main periods of development—*Old English,* from the earliest records to about 1100; *Middle English,* from this date to about the first third of the 15th century, and *Modern English* from then onwards. The dates given for the limits of the Old and Middle periods are only approximate, and it is impossible to mark off, with precision, epochs in a process of change and growth which is continuous. It is sometimes convenient to subdivide more minutely into *Early and Late O.E., Early and Late M.E., Early and Late Modern,* but it is often preferable to refer to the characteristic features of a specific century as revealed in the records.

Documentary Records.—The documentary records of English extend over a period of more than 1,200 years, the earliest documents being charters, in Latin, but containing names of English persons and places, written in the closing years of the seventh, and the first few years of the eighth centuries. (*See* Charters i., ii., iv. and v., in Sweet's *Oldest English Texts.*) The Moore ms. of Bede's *Ecclesiastical History* (*c.* 737) not only contains very early forms of English names, but preserves also a few lines of verse in the Northumbrian dialect, said by the historian to be the opening lines of Caedmon's poem on the Creation, of which only this fragment has come down to us. Glossaries and charters form the chief sources of our knowledge of English derived from mss. of the 8th century and the great bulk of documents in the oldest form of English belongs to the 9th and 10th centuries.

English, as is clearly revealed by the language of these early documents, belongs to the West Germanic branch of the great Germanic or Teutonic family, itself one of the subdivisions of Aryan. Germanic (Indo-European) speech was brought to these islands during the 5th and 6th centuries of our era, by heathen invaders drawn from three main tribes, the Angles from what is still called Angeln, the Saxons, from the country north of the Elbe now called Holstein, and the Jutes from further south in the same region. These various tribes were designated collectively by the Britons as "Saxons," after the tribe with whom they first became acquainted, *cf.* Modern Welsh *Sassenach,* applied to Englishmen generally. Bede uses the phrase "Angli sive Saxones," implying that both terms mean the same thing, though he usually refers to the people of the country generally as *Angli,* to the language as *sermo Anglicus.* In the 9th and 10th centuries *Angel cynn* and *Engle* are used for the people, *Englisc* for the language, and *Englaland* for the country. On the other hand *rex Anglosaxonum, Angel seaxna cyning* are found in the 10th century. The term *Anglo-Saxon* seems to have been revived in the 18th century for the oldest form of English, and is still much used, though perhaps *Old English* is now rather commoner among students of the language.

Of the ancient West Germanic languages of the Continent, the most closely related to the dialects of the conquerors of Britain were first Old Frisian, then Old Saxon, that is the speech of the Saxons who remained in their old homes. The Old High German dialects are considerably more remote especially in phonological character, from Old English, owing partly to the comparative fidelity with which the former adhered to the old vowel sounds which the English changed to a remarkable degree, partly to the characteristic changes in the consonants which distinguish the High German type from all the other West Germanic dialects. Some authorities consider the agreements between Old English and Old Frisian sufficiently close to justify the assumption of an early period of development common to both, from which it is but a step to postulate an Anglo-Frisian branch of West Germanic which, as some believe, was subsequently differentiated into English and Frisian. To this it may be objected that the earliest Frisian mss. are several centuries later than the English, and that the supposed phonological unity may be illusory, and due to similar, but much later, and independent changes in Old Frisian.

The differentiation from the old West Germanic type exhibited by the English dialects in their oldest recorded forms, while foreshadowing already the tremendous new developments in the future, had not yet gone so far in the 9th and 10th centuries, but that the Old Saxons and the English must have been able perfectly to understand each other's form of speech. By one of those extraordinary pieces of good fortune by which the industry of scholars is occasionally rewarded, a fragment of Old Saxon poetry in a 9th century hand was discovered some 30 odd years ago in the Vatican library, which was recognized as being identical with a passage in a well known Anglo-Saxon poem dealing with the story of Genesis, long attributed to Caedmon. On comparing the Old Saxon fragment with the Old English, it was obvious that the one must be based on the other, and the internal evidence makes it certain that the Old English as we possess it, must be a translation from the Old Saxon. The following short extracts from both versions show how close the two languages were in vocabulary, specific poetic diction, in the characteristic Germanic compounds, in accidences, word order, and general structure. The differences in spelling between the two reflect phonological differences, considerable indeed, but not sufficient to render either language unintelligible to speakers of the other.

Old Saxon

nis hebanriki
not is the Kingdom of heaven
gilic sulicaro lognura; thit uwas alloro lando sconiust
like to such flames; this was of all lands the loveliest,
that wit hier thuruh unkas herran thank hebbian muostun,
that we two here through our Lord's grace have might,
thar thu them ni hordis, thie unk thesan haram giried,
where thou to that one (him) not heard (obeyed), who for us two this calamity has decreed
that unit nualdandas nuord farbrakun
In that we two the ruler's (wielder's) word have violated (broken)
hebankuningas
the heavenly King's

Old English

nis heofonrice
is not the Kingdom of heaven
gelić tham lige: ac this is landa betst
like to this flame: but this is of lands the best

þæt wit þurh uncres hearran anc habban moston
that we two through our lord's grace have might,

þær þu þam ne hierde, þe unc þisne hearm geræd
there thou to that one (him) not heard who for us two this calamity has decreed

þæt wit waldendes, word forbræcon
in that we two the ruler's word (command) have broken

heofoncyninges
the heavenly King's

EARLY DIVISIONS OF ENGLISH

Dialectical Differences.—The different Germanic tribes which gradually overran Britain spoke, already in their ancient homes, dialects which were to some extent differentiated, and doubtless these differences were enhanced by the circumstances of political and geographical separation incidental to the settlement of a country of the size and physical character of Britain. But the dialectal differences of the Old English period do not amount to much. These differences consist chiefly in a slightly various development of the original West Germanic vowel system. This variety was rich in potentialities of later differences, rather than important in the 10th and earlier centuries. It could certainly have formed no bar to social intercourse. The old records enable us to distinguish four main dialectal types—the Northumbrian; Mercian; Kentish; Saxon.

Northumbrian and Mercian, which have much in common, represent the speech of different tribes of Angles, and are often referred to together as Anglian. Mercian was spoken in the greater part of the area between the Humber and the Thames; it is, speaking generally, the dialect of the West Midlands. From the Mercians (Mierce) a group of Anglians are definitely distinguished by name as East Anglians (Eastengle) who settled Norfolk and Suffolk. Unfortunately the dialect of East Anglia is hardly recorded before the Norman Conquest, but the copious remains of this type from the 12th century onwards show marked differences from the West Midland type.

Saxon Settlements.—The Saxons settled the whole country south of the Thames with the exception of Cornwall which remained Celtic, part of Hampshire and the Isle of Wight and Kent, which were settled by Jutes. Certain areas to the north of the Thames were also Saxon territory, namely Gloucestershire, Worcestershire, south-west Warwickshire, and, as the names themselves imply, Middlesex (Middlesexe, "Middle-Saxons") and Essex (Eastsexe, or "East Saxons").

Of the dialects of the Middle and East Saxons not enough is preserved in pre-Conquest documents to furnish data for a clear conception of their linguistic character, but from King Alfred's time onwards, West Saxon is recorded in the most considerable prose texts of this early period, and a form of Saxon, sometimes known as the Saxon Patois, is preserved in a collection of homilies, and some glosses of the 10th century. This latter dialect has some features characteristic of West Saxon, and others characteristic of Anglian, and is probably the dialect of Worcestershire. Kentish, preserved in various charters, glosses, and two sets of verses of no literary merit, covering the period from the late 7th to the 10th century, shows quite distinctive dialect features which mark it out, from the beginning, on the one hand from West Saxon, and on the other from Mercian.

The English, together with other ancient Germanic peoples, originally made use of the Runic alphabet (*see* RUNES), which speedily gave place to a form of handwriting which, with certain modifications, persisted during the whole Old English period. This was a special adaptation of the Roman alphabet in use among the Irish, and taught to the English by Christian missionaries from that nation. The age of the surviving English Runic inscriptions is uncertain, and most of them were probably, some of them certainly, produced at a time when the ordinary writing was already in use.

The Roman or Irish alphabet was soon rendered more suitable for expressing the sounds of English by the introduction of the Runic symbols þ ("thorn") for *th* and ƿ ("wēn") for *w*, for which *th* and *uu* were written in the earliest English records.

Old English Spelling.—The spelling of Old English is fairly consistent and represents, on the whole, an attempt to render the actual sounds as far as the alphabet, somewhat inadequate for its purposes, will permit. The characteristic vowel sound, approximately that in present-day English *cat*, is rendered by *æ*, a combination of *a*, and *e*; marks of quantity are used in many mss. though by no means consistently, and sometimes a vowel symbol is doubled to express length. Doubling of consonant symbols is consistently carried out to express a long, or double, consonant sound. On the other hand the symbol ʒ or ʒe is used to express at least three sounds, the stop *g*, and the back ("guttural") and front ("palatal") open consonants or spirants. Similarly *c* is used for the *k*-sound, and for a front ("palatal") stop which subsequently became "ch" as in *chin*.

The chief changes wrought in the West Germanic sound system in the dialects of Old English were in the domain of the vowels. As a result of isolative tendencies, the West Germanic *ā* became *ǣ*, *ă* became *ǣ*, the old diphthongs *ai*, *au*, *eu*, became respectively *ā*, *ēa*, *ēo* in O.E. Among characteristic English changes due to the influence of neighbouring sounds, may be mentioned: the diphthonging (fracture) of old *ǣ*, *ĕ*, *ĭ* to *eă*, *eŏ*, *iŏ* before certain consonantal combinations, and, in varying degrees in different dialects, also when followed by *o*, and especially, by *u*, in the next syllable (*u*-mutation); the fronting, or palatalizing of back vowels (*ā̆*, *ō̆*, *ū̆*) when originally followed in the next syllable by *i* or *j* (*i*-, or *j*-mutation). The old Germanic stress upon the "root" syllable of words was retained, and the vowels in the unstressed, inflexional syllables were consequently weakened and altered from their original sound. This weakening of unstressed vowels had advanced very far before the end of the O.E. period, and in Earliest Middle English had obliterated the earlier distinction between *a*, *e*, *u*, which are first confused, and then levelled under one sound which is written *e*.

OLD ENGLISH INFLEXIONS

The inflexions of Old English are of the typical Germanic and West Germanic character. Grammatical gender is preserved and the definite article, an old demonstrative, is fully inflected in singular and plural of all three genders. In addition to the case distinctions exhibited also by nouns, the article still preserves the old instrumental. The nouns retain traces of the oldest declensional types inherited from Aryan, but the best represented are the masculine and neuter *-a*-stems, and the feminine *-ō*-stems. In addition to the vowel stems the old *-n*-stems are very common. The *-n-* (weak) declension is also found in adjectives when preceded by the definite article or by a possessive pronoun. The comparative of adjectives ends in *-or*, *-er*, and the superlative in *-ost*, *-est*. The personal pronouns of the first and second person and of the third person singular feminine, agree with those of other Germanic languages, but the forms of the third person masculine and neuter—*hē*, *hēo*, *hit*, etc., differ from those of O.H.G., Gothic and O.N., but agree with the O.Fris. and O.Sax. forms, and are derived from an Aryan demonstrative *ki-*, etc., and traces of which are found in Gothic *hita*, "this," neuter *himadaga*, "this day," *cf.* O.E. dat. masc. and neut. *him*, and in *hina-dag*, "this day," *cf.* O.E. *hine*, acc. masc. O.E. agrees with other old Germanic languages in having two main types of verbal inflexion to express past time, the "weak" which form the Pret. and P.P. with the suffix (O.E. *-de*, *-ede*, *-ode*, and *-ed*, or *-od*), derived ultimately from an Aryan base, **dhē*—,"to put, place," seen in Greek τί-θη-μι and in English *do*, and the so-called "strong" conjugation, in which an alternation of vowels occurs according to the principles of Aryan and Germanic *Gradation*, *e.g.*, inf. *sprecan*, "to speak," Pres. *ic sprece*, "I speak," Pret. Sing. *spræc*, "I, he, spoke," Pret. P. *spræcon*, the same type occurring also in *spræce*, "thou spakest," P.P. (*ge*)*sprecen*; Inf. *cēosan*, Pres. *cēose*, etc. Pret. Sing *cēas* (Sec. Pers. *cure*) Pret. Pl. *curon*, P.P. (*ge*)*coren*.

The personal endings of verbs agree generally with Germanic and Aryan. The *-t* usual in the ending of the Second Person Singular is not original but derived from the following pronoun, in inverted constructions such as *liofast þu*, "livest thou," etc. O.E. agrees with other Germanic languages in having certain anomalous

auxiliary and preterite-present verbs. In the verb "to be" *eom*, "am," shows a trace of the old verbs in *-mi*, the Pret. *wæs*, "was," *wǣron*, "were," is common to all Germanic tongues. The same is true of *sċeal*, "shall," *sċeolde*, "should"; *cann*, "can" (Pres. Pl. *cunnon*), Pret. *cūþe*. *Wāt*, "I know," Goth. *wait*, cognate with *οἶδα*, has Pl. *witon*, Pret. *wisse* from Aryan **wid-tho* which shows the same gradational form as Greek *ἴδ-μεν*.

Vocabulary.—The vocabulary of O.E. is essentially West Germanic in character, and practically identical with that of O. Sax. and of O. Frisian. A certain number of Latin words had already been incorporated into O.E. during the Continental period, and indeed before the differentiation of West Germanic speech, as is proved in many cases by the forms, and by their occurrence in other West Germanic languages. Among words of this class, which still survive in English are *strǣt*, "paved road, street," Lat. *strāta (via)*; butere; Lat. *būtyrum*, from Greek Βούτυρον, "butter"; *ċiese*, *ċēse*, Lat. *cāseus*, "cheese"; *mynet*, whence *mint*, "a coin," Lat. *monēta*, "a coin, money"; *ynċe*, "inch," Lat. *uncia; pund*, "poundweight," Lat. *pondus*, "a weight"; *mil*, "mile," Lat. *milia; win*, "wine," Lat. *vinum*. A second small group of words in O.E. was derived in Britain from the Latin-speaking inhabitants of the towns.

Some of these forms show that changes characteristic of Late Popular Latin, or Romance, had already taken place before the borrowing into English. Examples are:—O.E. *cæfester*, "a halter," Lat. *capistrum; prāfost*, "officer, provost," Lat. *praepositus; cugele*, "monk's cowl," Lat. *cuculla; cylene*, for Lat. *colonia*, occurs in an old form of the ending of *Lincoln*, which exhibits traces of characteristic Celtic modifications in the Latin word, as well as the later O.E. process of *i*-mutation. The former made **colōn* into **colin;* the latter turned this into **culin*—whence *cylen(e)*. The common O.E. *ċeaster*, *ċæster*, originally applied to a Roman fortified town, then to a town or city in general, from Lat. *castra*, which survives in *Chester*, *Winchester*, etc., shows three typical O.E. sound changes—the fronting of *ă* to *æ*, the fronting of the initial consonant, and, in the W. Sax. form, the diphthonging of *æ* to *ea* after this consonant.

During the 6th and 7th centuries England was converted to Christianity, and through the Roman missionaries a fresh stream of Latin words less popular in character and form, was introduced —*sācerd*, "priest," from *sacerdos; discipul*, from *discipulus; munuc*, "monk," from *monachus; pāpa*, "Pope"; *martyr; crēda*, "creed," from *credo; ælmesse*, "alms," from *alimosina; mæsse*, "the Mass," from *missa*, and many others. Equally interesting and important are the new applications and adaptations of old native elements for the expression of Christian ideas. Thus *hūsl*, "sacrifice," *cf.* Goth. *hunsl*, is applied to the eucharistic sacrifice, and survives in the now archaic verb *to housel; sċearu*, "cutting, shearing," formed from the base of *sċieran*, "to cut, shear," is applied to the ecclesiastical tonsure; *fulwian*, "to baptize," from earlier *full*, "complete, full" and *wīhan*, "to make holy, consecrate," together with the noun, *fulluht* and *fulwiht*, "baptism." Other examples of adaptation are *hūsl-þegn*, "acolyte," lit. "housel servant, or thane"; *godspellere*, "gospeller," perhaps originally a literal translation of Lat. *evangelista*, though the first element was later probably identified with the word *God*.

The number of Celtic loan-words in O.E. is astonishingly small. The word *riċe*, "rule, dominion, kingdom," must be a very early Primitive Germanic inheritance, since it is found in varying forms in Gothic and Scandinavian, as well as in O. Sax. and O.H.G. and its *k* (as in Goth. *reiks*) shows that it must have been borrowed as **rig-* from a Celtic source, before the characteristic Germanic "shift" of voiced to voiceless stops. The O. Irish is *rī*, Gen. *rīg*, cognate with Lat. *rēg-*, "king," as in *rex*, Gen. *rēg-is*. The English word survives only in *bishop-ric*.

EARLY ENGLISH BORROWINGS

Although the English acquired no inconsiderable number of Latin words from the Romanized town-dwellers of Britain who spoke Latin, it is remarkable that they borrowed hardly any Celtic words from the country-dwelling Britons who had retained their own language. O.E. *dunn*, "brown, dun-coloured," and *binn*, "a manger," Mod. Eng. *bin*, are probably among the few words borrowed from the native speech of the Britons. *Dūn*, "hill, a down," is Celtic, but may have been borrowed in Continental times. O.E. *drȳ*, "wizard sorcerer," is from O. Irish *drui*, "soothsayer," and derived from the Irish missionaries to the north of England. The English *druid*, a late word, is from Lat. *druidae*, itself borrowed from a Celtic cognate of *drui*. Although the archaeologists are divided on the question, it seems probable that the humbler classes of Britons, speaking generally, were neither completely exterminated, nor all driven away, but rather that many were gradually absorbed into the English population. It was formerly widely held that in such names as *Walton*, *Walcot*, and others the prefix was derived from O.E. *weala-*, Gen. Pl. of *wealh*, "foreigner, Briton," later often used in the sense of "serf," especially "British serf," and that such place-names implied the existence of villages or homesteads where groups of Britons were allowed to remain, and live separate from their English conquerors. This view is now largely discredited, and the linguistic evidence derived from the earliest forms of the greater number of the *Wal-* names, as well as other considerations, makes it more likely that the prefix is O.E. *weall*, "wall," a word used in various senses, and possibly in place-names, implying a boundary wall or a sea wall, or embankment. (*See* Zachrisson, *Romans, Kelts and Saxons in Ancient Briton*, Uppsala, 1927, pp. 39, etc.) But whatever the truth in this matter, whether the Celtic speaking Britons were wiped out, or driven to the western borders; whether they were here and there permitted to dwell in communities segregated from the English, or, on the other hand, were gradually absorbed by marriage, the fact remains that their language has left no appreciable mark upon that of the conquerors.

A certain number of Celtic words referring to geographical features are found in place-names scattered in many parts of the country. A few of these may be mentioned. *Pen*, "head, top, hill, top of a hill," in *Pendledon*, *Penhill*, *Pentridge*, *Penburg*, etc.; British *cronkā*, "hill," *cf.* Cornish *cruc*, Irish *cruach*, variously modified in O.E. to *cric*, *ciric*, *cyrc*, etc., and appearing in Mod. English as *Crich*, *Crook*, *Creech*, *Church*, etc.; British *keto*, "wood," *cf.* Welsh *coed*, in Modern *Cheetwood*, *Chetwood*, *Cheetham*, *Chute*, *Chettle*, O.E. *cēthyll*, and so on (*see* Zachrisson, *op. cit.* pp. 47, etc.).

Scandinavian Element.—The Scandinavian element may be treated here since the O.E. period was that in which these words passed into English speech, although they appear only in inconsiderable numbers in our records before the Norman Conquest, and it is not before the 12th century that they become really numerous and then chiefly in the Eastern dialects and not until later still that certain of them become essential elements in English of other areas. About 790 a long series of raids and piratical incursions on our coasts began, carried out by Danes and Norwegians. Later, much larger hosts landed upon English shores whose aim was not casual piracy but serious conquest, and in 851 the "heathen" first spent the winter in England. After much fighting in which the English had the worst of it, by 877 or so, the invaders had obtained a firm grip on the whole of Northumbria, and a great part of eastern and central Mercia. In January 878, a fresh onslaught was made by the Danes on Wessex, from which they had been repelled in the previous year. For a time there was panic among the English, and the fortunes of Wessex and its royal house were trembling in the balance. During the third week of March, however, the nobles of Devonshire inflicted a decisive defeat upon the invaders in that country, and a month later the great king Alfred, at the head of an army composed of the levies from Somerset, Dorset, Wilts and Hampshire, gave battle to the main Danish army at Eddington in Wilts, and after a fiercely contested struggle, completely routed the enemy. The fighting strength of the Danes was utterly broken, and their chief Guthrum was constrained to withdraw entirely from Wessex, and he and many other leaders accepted Christianity and were baptized. The invaders departed eastwards and occupied East Anglia and Essex.

Within the vast area now settled by Scandinavians it is probable that the two populations, English and Danish, were first separate, each speaking their own language; gradually a fusion of peoples

took place, and there was a time when the inhabitants were bilingual. Then English remained as the sole tongue, but profoundly affected in vocabulary, and to some slight extent also in inflexions by Danish.

The later invasion of England by Svein in 1013 led to the flight of the English king, Ethelred, to Normandy. After the sudden death of the Danish leader came the election of his son Cnut as king of the Danes. Ethelred died in 1016 and was succeeded by his son Edmund Ironside as king of England. The English and Danish kings made an agreement whereby the country was divided between them, but a year later Edmund died and Cnut became king of the whole land. Danish kings ruled England till, on the death of Cnut's son Harthacnut in 1042, another son of Ethelred, Edward, later known as the Confessor, came back to the throne of his ancestors. Such very briefly were the historical events which led to a very deep penetration of our language by Scandinavian influence in many areas, and introduced innumerable words into the English vocabulary of everyday life.

The language of the Danes and Norsemen of the O.E. period, although belonging to a different branch of Germanic, was still so like English that hundreds of words in both were almost identical in form and meaning. In spite of many important differences the two peoples can have had little difficulty in understanding each other. As Jespersen remarks (*Growth and Structure of English*, p. 64), if we had no remains of English before the Conquest, it would now be quite impossible to tell, in regard to a large number of common words, whether they had come down to us from the O.E. native tongue, or had been borrowed from the Danes. He gives as examples among others, *man, wife, mother, folk, house, thing, will, can, meet, come, see, stand, sit, full, wise, will, better, mine, thine, over, under*, etc. All of these are, as a matter of fact, pure English and are found in the oldest sources, but had they been Scandinavian their forms would hardly have been different. Among undoubted Scandinavian words found in pre-Norman times, are several for special kinds of ships—*sicġþ, cnearr, barda; ōra*, the name of a Danish monetary unit; and the Anglicized (W.Sax.) *ċeallian*, "to call, shout," the later form of which is nearer to the original *kalla*. It is probable that O.E. *lagu*, "law," is an early borrowing, through a common word in O.E., by the side of the purely native *ǣ (w)*. *Hūsting, hūsþing*, "council, meeting," also raised dais, occurs in the latest O.E. period.

During the 12th and 13th centuries Norse words appear in large numbers in texts from the north, and from the east Midlands. From the latter area many gradually penetrated into the speech of London, and survive to this day in standard English, while hundreds more survive in local dialects.

In some instances the Scandinavian words have completely ousted the native words expressing the commonest ideas or objects, or have become more current than the former. In some cases both English and Scandinavian words are in use with differentiation of meaning. Examples of complete supersession in common words of native words by Scandinavian, are *sky* for O.E. *lyft, uprodor*, etc.; *die*, verb for O.E. *steorfan, sweltan, starve*, surviving in a specialized sense, the new verb being closely associated with Eng. *dead* and *death; take—took*, O.N. *taka, tōk*, for native *niman; fellow* for O.E. *ġefēra; knife* for *seax; leg* for O.E. *sċeanca*, "shank"; *low*, adj., for O.E. *niþer-, neoþoric; window* for O.E. *ēag-þyrel*, literally "eye-hole," or *fenester* from Latin; *egg*, for O.E. *æġ*, pl. *ǣgru*, M.E. *ēi, ēy-ren; awe* for O.E. *eġe*, "fear," M.E. *eie*. The following are Scandinavian and native English respectively, with differentiation of usage: *ill—sick; skirt—shirt; trigg—true; skin—hide; root—wort*. Sometimes where forms in the two languages bore a close resemblance, the English type has disappeared in favour of the Scandinavian. Thus *give* instead of O.E. *ġiefan, ġefan*, M.E. *ȝive, ȝeve; get* instead of O.E. *-ġietan* (which only appears with the prefix *and-, be-, for-*, etc.), M.E. *ȝēte; sister*, O.N. *systir*, instead of O.E. *swestor*, M.E. *swester, swuster, suster*, etc.

Often the Scandinavian word has imparted its meaning to its English cognate:—*brēad* in O.E. meant "crumb, morsel," while in M.E. and Mod. Eng. the sense is due to O.N. *brauþ*; O.E. *dream* meant "joy," but the word is used in M.E. as now with the same sense of O.N. *draumr;* O.E. *plōh* was a measure of land, but O.N. *plōgr* was the implement with which land was broken up for sowing, a meaning transferred to the present-day *plough* which has dispossessed O.E. *sulh;* O.E. *eorl* was originally "a man of noble birth, a gentleman," but it gradually acquired the sense of Scandinavian *jarl*, a title applied to the governor of a province, corresponding to O.E. *ealdormann*, and later still the name of a grade in the peerage corresponding with Fr. *count*. The English *þeigh* was ousted by *þouh*, "though"; in some eastern dialects of M.E. Scand. *oc* is found for O.E. *eac*, "also, and"; Norse *kettle* has taken the place of English *"chettle,"* O.E. *ċ(i)etel*.

The English borrowed from the Danish settlers a certain number of words expressing legal ideas, and some names of territorial divisions and kinds of jurisdiction. Thus *wapentake*, O.E. *wæpnageťæċ*, from O.N. *vapnatak;* O.E. *hāmsœn* from O.N. *heimsokn, "house-breaking,"* and the punishment for this; *þræll*. "thrall"; *North-, East-, West-riding* (Yorks) from O.N. *þriþjūngr*, "third part"; *By-(law)*, and the same element in *Derby* and other place-names, from Danish, meaning "town, village."

Perhaps the most remarkable fact connected with Scandinavian influence on English, is the gradual introduction of the O.N. pronouns of the third person plural, *they, their, them*, which have finally entirely superseded the native *hir, her, hem*, except for the colloquial survival *'em*. This process was no doubt facilitated by the use of the plural forms of the O.E. Def. Art.*þæra,þæm*, in much the same way.

In concluding this account of the O.E. period, two important facts call for mention. The first is the use of West Saxon from the 9th century onwards as a common literary standard. This was due to the hegemony of Wessex established by King Alfred and his successors, to the great king's zealous activities in the cause of education, his own copious writings, and the decay of the ancient learning in Northumbria. The great bulk of O.E. literature, both verse and prose, has survived only in a West Saxon form, and later local documents such as the boundaries in land-charters are written mainly in this dialect, with only an occasional typical local form.

The other characteristic feature of O.E. is the existence of a peculiar and highly developed poetic diction. Not only is there a large number of words whose use is confined to poetry, but we find a most elaborate system of metaphorical expressions and roundabout ways of referring to such things as the sea, the sun, ships, the sky, battle, a prince, a sword, the human body, and so on. Many of these become stereotyped and recur again and again; some of them are purely conventional and have no particular poetic value, while others are vivid and bear the impress of the poet's individuality. (*See*, on this, Wyld, "Diction and Imagery in Anglo-Saxon Poetry," in Vol. vi. of *Essays and Studies* by Members of the English Association, Oxford.)

MERGING OF OLD AND MIDDLE ENGLISH

It is not to be supposed that English underwent no change in phonology and accidence during the O.E. period. On the contrary, many of the features which are characteristic of M.E. were, gradually but surely, coming into being during the centuries before the Norman Conquest, although, owing to the rigidity of scribal tradition prior to this event, the language of the 11th century still continues to be spelt, as though no important change had taken place since the days of Alfred. But in spite of the fetters of convention, the vigilance of the scribe is occasionally relaxed, and scattered spellings in which the writer lapses for a moment into something like a faithful record of pronunciation, allow us to perceive that the vowel usually written *æ* had become *e*, that the diphthong *ea* had been monophthongized to *th*, and in eastern areas *eo* had become *e*, and that in unstressed syllables, the vowels *u, a, o, e*, were no longer distinguished in pronunciation. Less than 100 years after the Conquest, it is evident from the chaotic spellings of the latest entries in the Peterborough *Chronicle*, which ends in 1154, that the old scribal rules were but dimly remembered, at least in this East Midland area. On the other hand, it is possible, in spite of the numerous orthographic inconsistencies of this ms., to arrive at a fairly clear view of the sounds of the dialect, and it is evident that the new era in Eng-

lish speech has begun. It might indeed appear as if greater changes had come about in the 90 years since the Conquest, than during the whole period covered by the records before the death of the Confessor.

In reality no such rapid development has taken place, and the discrepancies in spelling, accidence and syntax between this part of the *Chronicle* and "pure" Anglo-Saxon of the latest pre-Conquest type, are due to the fact that the written documents had ceased for centuries to give a true picture of the language as it was actually spoken, while the Peterborough ms. is a pretty faithful record of living speech. There was, indeed, no break or sudden upheaval in the development of English caused by the Norman Conquest, and it is probable that apart from the vocabulary, our language would have developed into its present form, if that great historical event had never happened. So far as prose is concerned, the old purely literary tradition largely perished through the removal of English clerics and scholars, and a new style, based upon the spoken language, had to be formed.

Retention of Old Spellings.—English texts from the 12th to about the middle of the 13th century often retain O.E. spellings, especially when, as in some homilies and chartularies, the scribe had older documents under his eye which he copied or adapted, but the spelling is not consistent, the symbols, while occurring in their old places, are also put to new uses, and we find new and phonetic spellings by the side of the old stereotyped mode of writing. It is a period of scribal experiment. Owing to the tentative and unsettled character of the spelling, this is often regarded as a transition period between O. and M.E., as though the spelling faithfully reflected processes of change active in the language itself. Apart from the obvious fact that every age is one of transition, it would probably be more just to suppose that in actual speech the passage between the two epochs had long been made, that most of the characteristic phonological features of M.E. had already developed, although the scribes had not yet hit upon a fixed and consistent manner of expressing them.

One of the most enterprising spelling reformers of this age is one Orm, apparently of Scandinavian stock, the author of an exceedingly tedious scriptural metrical paraphrase of over 20,000 short lines, himself the scribe of the unique ms. This writer, whose work was, for sufficient reason, evidently not much in demand, hit on the plan of doubling a consonant after a short vowel, which makes his book valuable to the modern philologist as one of the chief authorities on English quantities round about the year 1200. He also invented a special form of the letter *g* to express the initial sound in *good.* Yet Orm does not recognize in his spelling the change, which by his time had certainly come about, of O.E. *ā* to *ō*, *e.g.*, O.E. *hām*, M.E. *hōm*, "home," and he adheres to the use of the O.E. symbol *ae* to express a long vowel in words where it is quite misleading as expressing the pronunciation of his own dialect.

During the later part of the 13th and the early part of the 14th century, English spelling gradually became more or less fixed, and the sounds are written in the various great dialectal areas, with fair consistency, to express the several characteristic regional types. English spelling was really benefited by the adoption of several symbols and graphic devices from Norman scribes, such as the Continental form of *g* to express a stop, leaving *ȝ* the modification of the O.E. symbol, free for the expression of the *y* (consonantal) sound for which *g* is also used; the use of *qu-*, as in *queen*, etc., instead of O.E. *cw-*; the use of *v*, or *u* instead of O.E. *f*, to express a voiced sound as in *over, ouer* for O.E. *ofer; ou* instead of *u* to express the vowel in O.E. *hūs*, "house"; the Fr. symbol *u* instead of O.E. *y* for the sound in O.E. *hyll, hȳdan*, "hill, to hide," etc. (that of Mod. Fr. *u*); *o* instead of O.E. *u* for the sake of clarity when the surrounding letters were *n, m, w*, e.g., *sone*, "son," for O.E. *sunu.*

In Fr. *c* before *i*, etc., expressed the *s-* sound, and this was sometimes written also in words of native origin, *e.g., seldcēne*, "rare," etc., and it still survives in *mice.* Since *c* to Norman eyes would, or might, imply *s* before *i* and *e*, *k* was written to prevent ambiguity where O.E. had usually *c*, in such words as *kin, kēpen*, O.E. *cynn, cēpan*, "kin, keep," etc. The sound expressed in O.E. by *cg*, as in *bryċġ*, "bridge," was written *gg, dg*, in M.E., and the front consonant written *c* in O.E., which occurred before original front vowels, was written *ch*, and later *cch, -tch*, medially or finally, *e.g.*, O.E., *ċin*, "chin," *ċeorl*, "churl," *ċeac*, "jaw," *sēċean*, "seek," *tæisan*, "teach," *wreċċa*, "exile, wretch," O.E. chin, *cherl, chēke, sēchen, tēchen, wrecche*, etc. The sound, or its forerunner, expressed by *sc* in O.E. was written *sch, sh*, O.E. *sċeal*, "shall," M.E. *s(c)hal*, O.E. *wȳsċean*, "to wish," M.E. *wis(c)hen*, etc.

These innovations in spelling, however, do not indicate changes in pronunciation. On the other hand the language of the M.E. period is distinguished from that which precedes it by many notable changes in phonology. The chief of these may be briefly summarized. O.E. *ā*, as already stated, was rounded, and acquired a sound, written *o*, or more rarely, *oa*, resembling most probably the vowel now heard in *saw.* This change took place in the dialects of the midlands and the south, but in the north, O.E. *ā* was fronted, whether long or short, to a sound which by the end of the 13th century, was probably approximately that of Fr. *é.* The diphthongs *ea* and *eo* were monophthongized—the former to a sound, not very different from that heard in Fr. *tête*, the latter to a vowel like that in Fr. *peu*, which subsequently was unrounded to *é*, long or short, in the more easterly dialects of the south and South Midlands, while farther west it remained a round vowel, and was later raised to a sound like that of Fr. *pu.* O.E. *ăe* in the Midlands, for the most part, and in Essex, was retracted to *ă*, while in Kent, Middlesex, and parts of the South-West midlands it was raised to *ĕ*. The corresponding long vowel became *ā* in Essex and a limited area in adjacent counties, but, in those dialects in which it had not, already in O.E., become *ē* (=sound of Fr. *é*), it appears to have passed into the vowel heard in Fr. *père.* O.E. *ȳ̆* (=Fr. *u*) was unrounded gradually to *ī̆* over a large area, a process which probably began in O.E. itself in the East Midlands, and spread west and south, while in many westerly areas of the south and Midlands, it appears to have retained for centuries later its old sound, and as stated above, was written *u* in M.E.

New diphthongs developed from the O.E. combinations *-ŏh, -ăh-, -ā̆eg-, -ā̆eh-, -ĕh-*, which became respectively *-ouh-, -auh-, -ei-, -eih-.* The diphthong *ēi* was monophthongized to *ī* over a wide area, in some regions of the south-east, as early as the 13th century. Great changes were wrought in the external form of English by a lengthening process which affected *ă, ĕ, ŏ* in open syllables (those not "closed" by a consonant) so that *bĕran*, "to bear," became *bēren, brŏcen*, P.P. became *brōken*, and *tăcan*, "take," became *tāken.* These changes were extremely important for the later history of English, since, while M.E. short vowels underwent comparatively little change, the long vowels were subsequently completely altered in character. Before double consonants, and most combinations of consonants, long vowels were shortened. This fact also had considerable effect upon the outward complexion of the language. For instance O.E. *fēdan*, "to feed," had a Pret. *fēdde.* In M.E. the long vowel remains in *fēden*, but is shortened before *-dd-* in *fĕdde*, which explains the difference between the present-day *feed—fed*, and similar shortening in dozens of other weak Prĕterites.

GRAMMATICAL CHANGES

The changes in accidence can only be very briefly summarized here. The decay, as it is often called, in the inflexional system of O.E., and the levelling out of older distinctions, was primarily due, not to the Norman Conquest, but to a tendency which continues to this day, and is a deep rooted characteristic of English, to obscure vowels in unstressed positions.

The elaborate inflexions of the definite article gave way very early in the north and Midlands before the newly-formed invariable þe used in all cases, genders and numbers. By the middle of the 14th century, except in a few rare survivals, the old inflected forms had everywhere disappeared. Nouns retain, after the earliest period, no case distinctions except the possessive, which was formed according to the commonest O.E. type, in *-es.* A certain number of scattered survivals of feminine possessives without *-s* occur throughout M.E., and into the 16th century; a few fossilized

forms such as *Lady Chapel* still persist. The main plural type of inflexion for nouns in M.E. is *-es*, though in some southern dialects weak plurals in *-en, -yn*, are fairly frequent, and sporadic forms such as *soweyn, Halwyn, applen*, etc., are found in late 15th century texts. A few examples of mutated Pl.—*tooth—teeth, mouse—mice*—still survive to the present time, and in M.E., a few others survive here and there—*gēt*, "goats," the rare M.E. *bēch*, "books," *kȳ*, "cows," etc. In O.E. neuter words consisting of one long syllable had no ending in the Nom. and Acc. Pl., and a few of these invariables such as *sheep, deer, swine* (now felt as a collective) survive, but as late as the 15th and 16th centuries, *thing, horse, apple, thank, year*, etc., are not infrequent in the plural.

The case-endings of adjectives are for the most part levelled under *-e* in M.E. Scattered survivals of the old strong endings are found, however, into the 13th century and even later in some areas, *e.g.*, Acc. Sing. Masc. *mucelne*; Dat. Sing. Fem. in *-re*; Dat. Pl. in *-en* after prepositions; Gen. Pl. in *-re*. Chaucer has occasionally *aller*, O.E. *ealra*, Gen. Pl. and fossil forms such as *alderbest*, etc.; *allermost* is found in the 15th century. The weak suffix *-en* hardly persists after the 12th century in adjectives.

Adoption of Scandinavian Forms.—The gradual adoption of the Scandinavian forms *they, their, them* in place of the native forms has already been noted. A curious form *his* in O.E. is used as an Acc. Pl. in the Third Pers. Masc. in 13th century texts, especially in S.E. Midlands, the south-east and in Middlesex; in Kent as late as the first half of the 14th century. The O.E. Acc. Sing. Masc. *hine*, is found as *hine, hin* into the 13th century, and survives to-day as *'en*, in many provincial dialects. In M.E. its place is taken by the Dat. *him*. The old Fem. *heo* remains as *heo, he, hue*, etc., in the south right into the 15th century, but in the north-east Midlands, and by Chaucer's time in the London dialect, it is superseded by *scho, sche, she*. Peterborough *Chronicle* already has this pronoun, written *scæ*. The origin of this form has not been satisfactorily established. The Possess. Fem. is *hire, here*, or in those dialects which use *hue* for Nom. Fem., *hure*. Some texts distinguish between *hire*, "her," and *here*, "their," but many use both forms indifferently. *Hir* or *her* is used generally for the Acc. Fem., though a few texts use *hi* for this. The Neuter *hit* is found with the aspirate as late as Queen Elizabeth's letters, though *it* is frequent from early M.E. onwards. The Possessive Neuter is *his* right into the Modern period, *its* being apparently first recorded in the first third of the 17th century. All the pronouns had weak forms without *h-* in unstressed positions, *e, im, er, it*, occurring very early. The Duals *inc* and *unc* are still used in the 13th century. In the Sec. Pers. *ȝē*, "ye," is used in the early 14th century in respectful address of a single person. In the Pl. *ȝē, ye* is strictly confined to the Nom. and *you* to the Acc. and Dat. until about the middle of the 16th century, when many writers begin to use the forms indiscriminately.

The main differences between O. and M.E. in the forms of strong verbs, apart from the normal qualitative and quantitative changes in the vowels, arise from new analogical formations, as when a verb is influenced by and assimilated to those in another gradation class, *e.g.*, P.P. *spōken* instead of *spēken* through the influence of *brōken*, or when a simplification of forms takes place, as in the difference between Pret. Sing. and Pl. is eliminated, both forms taking either the type of the Sing., or of the P.P. Such distinctions are *fōnd*, Pret. Sing. "found," *founden* Pret. Pl.; *can*, Sing., *cunnen*, Pl.; *rōd* Pret. Sing. of *rīden*, "to ride," *rīden*, "they rode," etc., still survive in Chaucer.

The possibilities for new analogical formations in the strong verbs are very numerous, and common verbs such as *give, get, bid, choose*, have an enormous number of variant forms in M.E. and Early Modern. The history of these and many other strong verbs demands individual treatment.

The personal endings of the verbs undergo little change in M.E. One novelty is the gradual elimination of *-eth* in the Third Sing. Pres. in favour of *-es*. The latter can be traced to O.E. *-as* in the north, but during the 14th century is fairly common in the more northerly areas of East Midlands and to a certain extent in Norfolk. It is doubtful whether the *-s* in Third Pres., which later appeared also in the London dialect, and during the 16th century in standard and literary English, can be traced to this source, and whether it may not rather be due to the analogy of *is*. The *-s* form was certainly colloquial in origin and was felt as unsuited to the most exalted prose style in the 16th century, though in poetry it is frequently used, by the side of *-eth*, for metrical reasons. A Pres. Pl. in *-en*, in place of older *-eþ*, was found on the analogy of the Subjunctive or of the Preterite and became typical of the Midland dialect. This form appeared to be getting the upper hand in London texts by the middle of the 17th century, and later became the sole form. The Pres. Part. has originally three forms in M.E. *-inde, -ende, -ande*. Speaking generally, the first is typical of the south, including London; the second of the Midland dialect; the last of the north. During the 13th century a new ending *-inge* of a doubtful origin, comes into use, first in the more southerly areas, but early in the next century, this form is found, together with *-and*, in N.E. Midlands. Early London texts have *-inde*, but in the 14th century *-ing* is firmly established as the sole form in this area. The P.P., which in O.E. had the prefix *ġe-*, preserves this, first as *ȝe-* later as *i-* in southern dialects of M.E., including that of London. Strong P.P.'s end in *-en* in the Midlands, but in *-e* in the south and very commonly in the dialect of London.

DIALECTS IN THE TEXTS

Among the most interesting problems for the student of M.E. are those connected with the numerous varieties of dialect exhibited in the texts, and the gradual emergence of one regional type as that of preponderating importance, and of wider currency than any other, that is the formation of a standard of literary usage. The dialectal variety revealed by the mss. of the M.E. period is far richer and more complicated than that discoverable from the written records before the Norman Conquest. This does not mean that a new process of speech differentiation was at work, associated with, or promoted by, the altered social and political conditions, whereby fresh dialect types were created. The linguistic variety, the multiplicity of regional forms of speech, differing from each other in varying degrees, according as they were severally spoken in adjacent or distant areas, existed before the Conquest, but most of the variants found no expression in written form in the O.E. period, owing to the outstanding supremacy of the West Saxon type.

Of the features which mark dialect individuality, some are phonological and consist in a characteristic development of O.E. vowel sounds, others consist in details of inflexion. Vocabulary is an uncertain guide to dialect, as the regional distribution of particular words is at present but imperfectly ascertained. It may be admitted, however, that the presence of a large number of Scandinavian words in a M.E. text would tend to show an easterly, Midland, or northern origin, rather than one from the south. The difficulty of deciding with certainty from what precise area a given M.E. text emanates, arises from the fact that this is known concerning so few texts, that a standard or touchstone which can be applied as a test of dialect is often lacking, so that, while it may be possible to say generally that a text is, say East Midland or South-western from the character of its dialect, it may not be easy to determine whether the text in question was written in Norfolk, Suffolk, Lincs., or Cambridgeshire, whether in Wilts, Dorset, or Devon, and so on.

Since about 1910, considerable fresh light has been shed upon the problems of the geographical diffusion and distribution of phonological features in M.E. by a series of investigations into the early forms of place-names (*see* PLACE-NAMES) in a number of areas. These names are composed of elements which are familiar also as independent, separate words in English, and these elements vary from area to area in accordance with dialect habit, no less when compounded as names, than when occurring as independent words. Such elements as O.E. *hyrst*, "wood," *hyll*, "hill," *hȳþ*, "landing-place," *leāh*, "field," *heāh*, "high," *stiēpel*, "steeple," *neoþor*, "lower," *heorot*, "hart," *mæd*, "meadow," *hæþ*, "heath," and so on, exhibit, when recorded in place-names, in local chartularies, etc., of the early centuries after the Conquest, the forms characteristic of the dialect of the

area in which the place is situated. The written forms of place names also reflect the changes which are taking place within the dialect from age to age. By the systematic use of this new source of information, the area of origin of many M.E. texts, and that within comparatively narrow limits, has been settled with a considerable degree of probability.

It has further been shown that certain combinations of dialect features found in texts, formerly supposed to be mutually incompatible, and ascribed to scribal influence, really are typical of a genuine dialect, and occur in the place names forms of a particular area. The results of recent investigations in this field have yielded a far more minute knowledge of the areas over which the main distinctive phonological features are distributed, a knowledge of the possible combinations of features, and of the way in which the general complexion of a dialect may vary according to the period. A general principle of some importance which has been established by recent regional surveys of M.E. dialects is that these were not severally confined within clear-cut borders but that they dovetailed and melted by imperceptible stages, each into those of adjacent areas. Further, there were many areas which were definitely what may be called border areas, in the speech of which, features characteristic of several dialect types were intimately intermingled.

All this is not without significance for the proper understanding of the development of what, by the end of the 14th century, was rapidly becoming the leading form of English in literature and in written documents of all kinds, which was destined to become the sole type used in writing, and to gain universal currency as the polite spoken standard. As long ago as the '80s of last century, Morbach, basing his observations on the 14th and 15th century sources, proved conclusively that the language of Chaucer was ultimately the dialect of London, and of the official documents. Chaucer's dialect exhibits what used to be called a "mixture" of types, some features of which were called "Kentish," others East Midland, while yet others were described, generally, as "Southern." The prevailing view was that this London dialect had grown up from a combination of elements imported from outside, chiefly by traders coming from East Anglia to the great market and centre of commerce in the metropolis. The facts may now be differently explained.

In the early 13th century, from the sources now available, it is possible to distinguish two markedly distinct types of dialect in the areas from which the later London dialect sprang—a city type which is almost identical with that of Essex, and what may be called the county dialect of Middlesex. There is further, a third, intermediate, type preserved in a collection of charters written at Westminster about 1250 or a bit later. The later 14th century London dialect of Davie, Chaucer and the official Records, is a blend of the old City and Middlesex types, together with certain features which, apparently, are to be traced to the adjacent areas of Herts. It is essentially a regional dialect. The chief feature formerly regarded as Kentish ($\check{\bar{e}}$ for O.E. $\check{\bar{y}}$) is certainly of the old City-Essex type, the "southern" features are those of the old Middlesex type, which was very near to West Saxon in many respects, while of the "Midland" characteristics, some are found in the 13th century City documents, and others, as stated, have come in from Herts. (For the latest account of the early and later London dialect in M.E., together with references to sources and authorities, *see* the work of B. A. Mackenzie *cit.* in Bibliography.)

THE SPREAD OF LONDON ENGLISH

The fact that the form of English which had grown up in the area of the metropolis and its immediate environs was that in which Caxton and the other early printers produced their books, undoubtedly promoted its rapid dissemination in all parts of the country, but the use of London English as the common language of literature, though facilitated by the introduction of printing, was not the result of this. There is plenty of evidence to show that a knowledge of this type, and its use in writing, were widespread before the art of printing was thought of. There are collections of private letters, literary works and official documents written during the first half of the 15th century and a few years later, in areas as remote from London as Norfolk, Devonshire, Oxfordshire and Worcestershire, for instance, in which the traces of local dialect are so few, that the language is hardly distinguishable from that of London. This does not imply that the old regional dialects had ceased to be spoken, but merely that their use *in writing* was gradually discontinued. (For an admirable account of the profound effects of Norman French upon the English vocabulary, the reader should consult Jespersen's *Growth and Structure of English,* and works there referred to.)

Meanwhile the external form of English had not remained unaltered during the centuries which elapsed between the coming of the Normans and the death of Chaucer in 1400. Opinions differ as to the most suitable approximate date at which to place the beginnings of the modern period of the language. Most of those who have considered the subject in the light of a knowledge of the written sources down to and into the 15th century, will recognize the abundant signs that what has been called the "great vowel shift," that is, that remarkable series of changes in pronunciation which distinguishes Modern English, was not the result of a process which started suddenly and produced its effects within a few years, but of slow-working, gradual tendencies, which had been at work for centuries. From the 13th century onwards certain occasional spellings occur scattered in mss. written in various parts of the country, which must be regarded as unconscious scribal lapses in the direction of a more phonetic expression of actual pronunciation, than was exhibited by a mode of spelling which had already become more or less fixed and conventional. Thus the (13th century) spelling *sichen,* "seek," in place of the normal *sechen,* suggests a sound nearer to the modern one in *beseech,* than that which *e* was originally intended to express, namely, a long vowel closely resembling in quality that written *é* in French. The M.E. scribe generally adheres pretty closely to the models in which he was trained, and his lapses are comparatively few, but during the 15th century, and still more in the 16th, when writing became an art no longer confined to professional scribes, these unconscious, occasional phonetic spellings are very numerous, in documents of all kinds written by private persons who followed the rules less rigidly.

It is in the 15th century that we first get really copious evidence from spellings that great changes have come about, not only in the vowels and stressed syllables, but in those of unaccented syllables, and in many consonantal combinations. Caxton, however, and other early printers, adopted the conventional scribal spelling of the late 14th century, and this, with very slight modifications, and these not of a phonetic character, has been retained, so that we learn next to nothing from them of the beginning of the new era in pronunciation which must have been well under way before the end of the 14th century. The M.E. vowels had the so-called "continental" values, and the symbols express, for the most part, the sounds which they expressed in Italian or in French.

The main changes which distinguish Modern English pronunciation from that of the M.E. period are: M.E. *ă, hădde,* "had," etc. (with sound of German *mann*) has been fronted; M.E. *ā* (with sound of Ital. *capo*) has likewise been fronted, M.E. *māde,* "made," etc.; M.E. *ē,* in *sēchen,* "seek" (with sound of Fr. *é*) has been raised; M.E. *ē* as in *mēte,* "meat" (with sound of Fr. *ê*) was first made into a sound like that of Fr. *é,* and later, in some dialects, also raised to the same sound as that of *ē′;* M.E. *ī,* in *wīf,* "wife," *chīld,* "child," etc. (with sound of Fr. *cire*) was diphthongized; M.E. *ō′,* as in *mōne,* "moon," etc. (with sound of German *roth*) was over-rounded, and raised to the present *ū*-sound; M.E. *ō* as in *bōt,* "boat" (with sound resembling that in present-day *saw*) was made tense as in German *roth,* etc.; M.E. *ū* in *hūs, hous,* "house" (with sound of the present vowel in *hoot*) was diphthongized; M.E. *ai,* as in M.E. *rain,* "rain," etc. (with sound of present vowel in *rite*) had the first element fronted, lost the second element, and was levelled under the same sound as M.E. *ā;* M.E. *au,* as in *taughte,* "taught" (with a diphthong similar to that of present-day *shout*) was monophthongized, the first element being rounded, and the second element gradually weakened and

lost, giving the present sound; M.E. *ou,* as in M.E. *doughter,* etc., simply lost the second element of the diphthong and was levelled under the new sound derived from M.E. *au;* M.E. *ŭ,* as in M.E. *sŭne,* more often written *sone,* "son" (with vowel as in present-day *pull*) was unrounded and lowered to the characteristic Modern English vowel heard in *shut, hurry,* etc.; M.E. *ü* in French words such as *judge, just,* etc., and the same sound, when it occurred in English words, *suche, bundel,* etc., was retracted to the sound of English *ŭ,* and together with this, was unrounded, etc.; M.E. *ū* in French words, *pure, fruit, rude,* etc., retained the French sound, and was, perhaps during the early 16th century, diphthongized to the sound we now give in naming the letter *u.*

From the evidence of the occasional spellings, and of certain rhymes which now appear for the first time, it seems certain that, by the first third of the 15th century, most of these considerable changes had progressed at least far enough to justify the statement that the old M.E. vowel system had passed away, and that what may fairly be called modern pronunciation was approaching while some vowels had fully attained this. By the end of the 15th century something very near the present day must have been reached, though the processes of change were not perhaps absolutely complete for all vowels, nor had the exact shades of sound which we now regard as the standard type finally developed, nor become everywhere current.

Pronunciation Problems.—The problems of the history of English pronunciation during and after the 16th century are closely bound up with the spread of a spoken standard, and the varying complexion of this. Henceforth it is not so much a matter of changes in the actual character and quality of the sounds, as a question of the relations between various existing types, current among different groups of speakers. During the 16th century there is the first definite evidence of the existence of a spoken standard, that is, of a sense that one mode of speech is superior to another, and therefore to be used by polite speakers. The standard of the 16th century was the ultimate speech of the London area, and more particularly, that variety of it spoken by the court and the upper grades of society. But the standard, far into the 17th century at least, was nothing like so fixed and definite as at present, where there is an accepted pronunciation of the vast majority of words in ordinary, common, polite use, deviation from which is regarded either as a provincialism or as a vulgarism. It appears from all the sources of information available, that in the 16th and 17th centuries, and in a great part of the 18th, considerable variation of pronunciation existed, and was tolerated, among those who were regarded as speaking according to the fashionable standard. It is certain that rustic forms of speech were in use among many of the country gentlemen who came to London from time to time from their estates to taste the pleasures of the gay and fashionable world, to which they found a ready entry from their family connections and their personal rank. To speak the dialect of one's native village, or at least to have an appreciable rustic smack in one's speech, might provoke the mirth of town wits and make a man the butt for writers of comedies, but it did not disqualify him from frequenting the politest society.

The prevalence of regional dialect among the upper grades of society is evident, for instance, from many of the letters in the incomparable Verney collection, the writers of which nearly all belonged to the landed class, from the novels of Fielding and Smollett, while the rhymes of such poets as Waller and Dryden here and there betray regional influence. But another, and perhaps more important factor, in moulding the spoken standard, and in determining which type should ultimately prevail, was the influence of class dialect, and especially is this observable in the gradual elimination of the old types of unstudied, careless, traditional pronunciation common to the upper classes during the 16th, 17th and 18th centuries, in favour of a more careful mode of speech which aimed at a greater "correctness" and a closer adherence to utterance suggested by the spelling. This tendency, to which we owe much in our present habitual pronunciation, came from the educated middle and lower classes, who, lacking established tradition of easy polished conversation current among the superior ranks, though often exceeding these in learning, were compelled to build up a colloquial tradition of their own which should be worthy of their culture and their taste.

Somewhere about the middle of the 18th century there seems to have been an appreciable reaction against the fashionable carelessness of pronunciation so long in vogue, and slowly but surely the ideals of the purist, and, as many must have thought, the pedant, began to prevail. Thus the standards of what was polite, or what was ridiculous or vulgar in speech, were slowly modified; much hitherto held fashionable was eliminated, and much formerly felt as strange and pedantic, was permanently adopted as correct. This process of deliberately substituting a new, careful pronunciation based on the spelling for what is ancient, traditional and unstudied, is for ever at work, though many of the older types of pronunciation die hard, and will probably linger for many generations still among the upper classes who are ever more conservative in their speech.

As recent examples of the process may be cited the introduction of an aspirate a few generations ago, in *herb, humble, hospital,* and within the last few years, among certain classes of speakers in *humour;* the substitution of *"-ing"* in pronunciation, in the ending of present participles, for the old *"-in";* the introduction of a *"t"* sound in *often, soften; landscape* for old *lanskip; waistcoat* pronounced as spelt, instead of "weskot"; the introduction of an aspirate in the last syllable of *forehead,* and *neighbourhood.* Yet earlier innovations of a similar kind are the present pronunciation of *gold,* in place of the traditional *"goold," London* with a *d* sounded, instead of older "Lunnon," the long vowel in *leap* instead of "lep," *hundred* for "hunderd," *Rome* (probably from French or Ital. type) for older "Roome," *china* instead of "chayney," the ousting of the pronunciation "dooer" for *door,* the sounding of *w* in *forward, Edward,* and many other words in which this sound was normally lost at the beginning of an unstressed syllable.

The older pronunciations here indicated were those used by the best speakers in the 17th and 18th centuries, and many of them might still be heard among old-fashioned speakers of the upper classes far into the last century. Two other important changes in speech habit may be mentioned, involving whole groups of words. The first is almost certainly due to the influence of class dialect though it may be regional in origin. M.E. *ē,* in such words as *steal, meat, heat, seat, sea,* etc., was by most good speakers pronounced like *stale, mate, hate, sate, say,* etc., far into the 18th century. Another type, having the *"ee"* sound, had existed at any rate in the 16th century, though for a long time it seems to have been confined to a relatively small group of speakers, and was not fashionable in standard English. During the 18th century word after word was gradually transferred, as it were, to the *"ee"* type, until by the early 19th century, it had become fashionable to pronounce all words of this class in this way except *great,* and *break,* and even these may be heard in some dialects with *"ee."* The spelling *ea* which is used in most words containing M.E. *ē,* is one of the last attempts at a phonetic distinction in orthography which has become fixed.

The other large class of words for which a different type of pronunciation from that in use in the 17th and 18th centuries is now current, is that group spelt with *er.* Such words as *serve, servant, swerve, diversion, divert, vermin, fervent* and many others, as appears both from numerous spellings in private letters, and from the rhymes of poets, were commonly pronounced "sarve, sarvant, swarve, divarsion," etc. The only words which retain the "ar" pronunciation are *clerk,* and the proper names *Derby* and *Bertie,* and in these the *"er"* pronunciation is still a vulgarism, just as, on the other hand, "sarve, divarsion," etc., would be.

CONTINUITY OF FORM

The study of English as preserved in the documents of the past, decade by decade, from the earliest records of every kind, down to the present day, leaves upon the mind a sense of a wonderful continuity. The language is felt indeed to be always changing, but so gradually that the speech of one age passes by almost imperceptible degrees into that of the next. It is impossible to

say at what point one period comes to an end and the next begins. And what is true of the external form of the language is true also of the spirit and genius, the atmosphere reflected in the style. To regard the changes of human speech as deliberately brought about, and the language as it exists at a given moment as the result of conscious effort, is an error. Even the vagaries of fashion, which play a large part in determining the character of a standard of speech, are not so wholly artificial as they appear, since the choice of fashion, often an unconscious act, can as a rule be exercised only within the limits of what actually exists in this or that dialect, and consists in the selection of one from among several types, each of which has been developed by a natural, unconscious process, among a community of actual speakers. It is impossible to say by what social currents a given form from some external dialect may have been brought within the ken of speakers of standard English at a certain moment, nor what subtle drift of tendency or motive may have led to its gradual adoption as a current and accepted form. The only really artificial elements in English are such as have been deliberately concocted from the spelling, by speakers who either through ignorance or prejudice, substitute such innovations as we have cited above, for the established traditional forms. But even these novelties, artificial as they may be in origin, often pass, in a few generations, into the storehouse of traditional speech.

BIBLIOGRAPHY.—(I.) 1. *General Bibliographical Works.* Lists of current contributions to the study of English appear regularly in the following periodicals:—*The Modern Language Review; Review of English Studies; English Studies* (Amsterdam); *Englische Studien, Beiblatt zur Anglia* (Halle); *Annual Bibliography of English Language and Literature* (Modern Humanities Association, Cambridge); *The Year's Work in English Studies* (published annually since 1921). Many books in the following sections contain more or less extensive bibliographies; these have (bibl.) after the title. 2. *General Works on the History of English.* H. Bradley, *The Making of English* (1904); R. Huchon, *Histoire de la Langue Anglaise*, tome i., "Des origines à la conquête normande" (1923, bibl.); O. Jespersen, *Growth and Structure of the English Language* (1923); E. Kluge, *Geschichte der englischen Sprache* (Halle) in Paul's *Grundriss d. German. Philologie* (2nd ed.) also published separately (bibl.); K. Luick, *Historische Grammatik d. englischen Sprache* (1913–21), to p. 548. (bibl.); R. Morris, *Historical Outlines of English Accidence* (revised by Kellner and Bradley) (1897); H. Sweet, *A New English Grammar, Logical and Historical*, pt. 1, Introd. Phonology and Accidence (1892); pt. 2, Syntax (1899); H. C. Wyld, *A Short History of English* (3rd ed., revised and enlarged, 1927) (bibl.). 3. *Works on the English Vocabulary and English Etymology.* J. B. Greenough and G. L. Kitteredge, *Words and their Ways in English speech* (1902); G. H. McKnight, *English Words and their Background* (1923, bibl.); W. W. Skeat (1) *An Etymological Dictionary of the English Language* (1910), (2) *Principles of English Etymology* (2 vols., 1891–92); E. Weekley, *The Romance of Words* (1913). (To this section belong in the main the works by Bradley and Jespersen mentioned above.) *The Oxford English Dictionary* (ed. by Sir James Murray, Henry Bradley, Sir William Craigie and C. T. Onions).

(II.) *The Old English Period.* 1. *Dictionaries.* James Bosworth and T. N. Toller, *An Anglo-Saxon Dictionary;* also Supplement by T. N. Toller (1923); Clarke Hall, *An Anglo-Saxon Dictionary;* H. Sweet, *A Student's Anglo-Saxon Dictionary* (1911). 2. *Grammars.* K. Bülbring, *Altenglisches Elementarbuch* (only pt. i., Phonology) (Heidelberg, 1902, bibl.); E. Sievers, *Angelsächsische Grammatik* (3rd ed.) (Halle, 1898, bibl.); E. E. Wardale, *An Old English Grammar* (1922); J. and M. E. Wright, (i.) *An Old English Grammar* (1908), (ii.) *An Elementary Old English Grammar* (1923). 3. *Foreign Loan-words in O.E.* F. Kluge. *See* "Englische Sprache" in Paul's *Grundriss, cit.* in (I.) 2. above; H. S. MacGillivray, *The Influence of Christianity on the Vocabulary of Old English* (Halle, 1902, bibl.); A. Pogatscher, *Zur Lautlehre der griech., latein., und roman. Lehnwörter im Altenglischen* (1888). 4. *Old English Handwriting and Runes.* W. Keller, *Angelsächsische Palaeographie* (2 pts.; pt. 2 contains facsimiles and transcriptions, 1906); E. Sievers, "Schriftkunde," in Paul's *Grundriss*, 1899 (contains a table of Runes); W. Vietor, *Die nordhumbrischen Runensteine* (Marburg, 1905). 5. *Old English Texts and Sources.* The following contain lists of the principal texts classified according to dialect: K. D. Bülbring, *Altenglisches Elementarbuch*, §§ 19–27; K. Luick, *Historische Grammatik d. Englischen Sprache* §§ 20–26; H. C. Wyld, *Short History of English*, pp. 55–56. For a general account of O.E. literature *see* A. Brandl's *Geschichte der altenglischen Literatur*, 1908.

(III.) *Middle English.* 1. *Dictionaries.* A. L. Mayhew and W. W. Skeat, *A Concise Middle English Dictionary* (1888); F. H. Stratmann, re-edited by Henry Bradley, *A Middle English Dictionary* (1891). (Editions of M.E. texts published by the Early English Text Society, and by the Clarendon Press, usually contain copious glossaries.) 2. *Grammars.* R. Jordan, *Handbuch der mittelenglischen Grammatik* (1925), pt. 1, "Lautlehre" (bibl.); L. Morsbach, *Mittelenglische Grammatik*, only a fragment of 192 pp. Halle, 1896 (bibl.); J. and E. M. Wright, *An Elementary M.E. Grammar* (1925); H. C. Wyld, chap. vi. and ix. in *Short History of English* (*cit.* I. 2. above) and chap. ii. in *History of Modern Colloquial English* (*cit.* iv. below). 3. *The London Dialect and the Rise of a Literary Language in M.E.*, W. Dibelius, "John Capgrave und die englische Schriftsprache," in *Anglia* vols. xxiii. and xxiv.; H. M. Flasdieck, *Forschungen z. Frühzeit der englischen Schriftsprache*, 1922 (bibl.); W. Heuser, *Alt-London, mit besonderen Berücksichtigung d. Dialekts*, 1914 (bibl.); B. A. Mackenzie, *Contributions to the History of the Early London Dialect* (1928, bibl.); L. Morsbach, *Über den Ursprung der neuenglischen Schriftsprache* (Heilbronn, 1888); B. Ten Brink, *Chaucersprache und Verskunst* (2nd ed., Leipzig, 1899); F. Wild, *Sprache d. wichtigeren Chaucer-mss.* (Leipzig, 1915, bibl.). 4. *Bibliography of M.E. texts, mss., and monographs.* J. M. Booker, *A Middle English Bibliography* (Heidelberg, 1912); J. E. Wells, *A Manual of the Writings in Middle English* 1050–1400 (1916, 1919; with Supplements 1919 and 1923). (Bibliographical information is also contained, together with lists of M.E. texts classified according to dialect, in the works of Jordan, Morsbach and Wyld, *cit.* (III.) 2 above.) An excellent general survey of M.E. sources will be found in Brandl's *Mittelenglische Literatur*, in Paul's *Grundriss* ii., in Luick's *Hist. Grammatik* §§ 29–39. 5. *M.E. Handwriting.* Charles Johnson and Hilary Jenkinson, *English Court Hand from 1066–1500 A.D., illustrated chiefly from the Public Records*, pt. 1, text; Pt. 2, plates (1915); W. W. Skeat, *Twelve Facsimiles of English Manuscripts*, with transcriptions and introduction (1892); Sir E. M. Thompson, *History of English Handwriting* (1901). 6. *Foreign Loan-words in M.E.* D. Behrens, "Die Französische Lehnwörter in Englischen" in Paul's *Grundriss*, i. (2nd ed., 1927); Bense, *A Dictionary of Low Dutch Words in English* (1927); E. Björkman, *Scandinavian Loan-words in Middle English*, pt. 1 (Halle, 1900); pt. 2 (1902, bibl.); Otto Jespersen, chap. v. in *The Growth and Structure of English* (1923); Lindqvist, *M.E. Place Names of Scandinavian Origin* (Uppsala, 1912, bibl.); W. W. Skeat, *Principles of English Etymology*, vol. ii.; J. Vising, *Anglo-Norman Language and Literature* (1923); E. Zachrisson, *A Contribution to the Study of Anglo-Norman Influence on English Place Names* (Lund, 1909, bibl.).

Dialects, 1889), Early English Text Society. W. Horn, *Historische neuenglische Grammatik* (Strasbourg, 1908, bibl.); O. Jespersen, *A Modern English Grammar on Historical Principles*, pt. 1, Phonology (Heidelberg, 1909); pt. 2, Syntax (1914, bibl.); A. Kihlboom, *Contribution to the Study of Fifteenth Century English* (Uppsala, 1926, bibl.); H. T. Price, *History of Ablaut in Strong Verbs from Caxton to the end of the Elizabethan Period* (Heidelberg, 1910); W. Vietor, *Shakespeare's Pronunciation*, pt. 1 Phonology and Rhyme Index (Marburg, 1906); pt. 2 Shakespeare Reader (1907); H. C. Wyld (1) *A History of Modern Colloquial English* (3rd impression, 1925, bibl.); (2) *Studies in English Rhymes from Surrey to Pope* (1923); (3) chaps. v. to ix. in *Short History of English, cit.* I. 2 above; R. E. Zachrisson, (i.) *Pronunciation of Modern English Vowels*, 1400–1700 (Göteborg, 1913, bibl.); (ii.) *The English Pronunciation at Shakespeare's Time, as taught by Wm. Bullokar* (Uppsala, 1927); (iii.) *Romans, Kelts and Saxons in Ancient Britain* (Uppsala, 1927).

(V.) *Readers and collections of extracts from Old and Middle English Texts.* Most of the following books contain grammatical introductions, and notes and glossaries. 1. *Old English.* W. Sedgefield, *An Anglo-Saxon Book of Verse and Prose* (1928); H. Sweet, *An Anglo-Saxon Reader in Prose and Verse* (9th ed., revised by C. T. Onions, Oxford, 1922); A. J. Wyatt, *An Anglo-Saxon Reader* (Cambridge, 1919). 2. *Middle English.* A. S. Cook, *A Literary Middle English Reader* (New York and London, 1915); Carleton Brown, *Religious Lyrics of the Fourteenth Century* (Oxford, 1924); Joseph Hall, *Selections from Early Middle English*, 1130–1250, pt. 1 texts; pt. 2 notes (Oxford, 1920); R. Morris and W. W. Skeat, *Specimens of Early English*, pt. 1 1150–1300; pt. 2 1298–1393 (Oxford, 1898); Kenneth Sisam, *Fourteenth Century Verse and Prose*, with a Glossary by J. R. R. Tolkien (Oxford, 1922). (H. C. WY.)

American Dialects.—Dialects of American English are not so important or so marked as those of the mother country. The settlement of much of the United States is so new, and its inhabitants and educators so migratory, that local peculiarities have had, as a rule, little time in which to develop. The leading types of regional dialects are those of New England, the South, the Central West and the Far West. But between the speech of Boston, which had for a time a certain prestige partly because the early dictionaries were made there, and the speech of New York, New Orleans, Chicago and San Francisco, there are, despite the distances involved, no very great differences. Denial has been made, indeed, of the existence of American dialects.

There are, however, in outlying regions and in settlements of foreigners, local varieties of speech that are genuinely dialectal. James Russell Lowell summarized many peculiarities of Yankee

linguistics in his *Biglow Papers* (1846, 1866). The vernacular of the Maine coast or of the Cape Cod region exhibits local peculiarities. The language of the Tennessee and Carolina mountain region found literary preservation in the stories of Charles Egbert Craddock (Mary N. Murfree, 1850–1922) and others. The Ozark mountain district has distinctive idioms, vocabulary and pronunciation, revealing many archaic features. Cape Hatteras island has preserved many colonial or Elizabethan turns of expression, now fast fading. Throughout the United States, ranging from the Adirondack country to the flats of Georgia or the Sandhill region of Nebraska, are communities having curious local expressions or characteristics. The "worst English in the world" is said to be that spoken by the Gullah negroes of the Georgia and Carolina coasts and sea islands. It differs from and has more archaic features than the familiar negro dialect of the works of J. C. Harris, T. N. Page and their successors. Gullah dialect was lifted into literary notice by the "Black Border" stories of A. E. Gonzales (1857–1926). Harris had written a few stories in the Gullah dialect.

The dialects spoken by foreign populations have received attention from scholars, but more should be given them. To be taken into account are the French-Creole of Louisiana, French-Canadian, Spanish-Mexican of the Southwest, Italian-English dialects, German, Yiddish, Swedish, Norwegian, and Danish-American, Jersey and Pennsylvania Dutch, Slavic-English and other hybrid tongues. The Chinook or Trade Jargon of the Pacific North-west, once widely used by Indian tribes and by the white men with whom they traded, has bequeathed a few words to the English vocabulary, but it now has no utilitarian purpose and is fast dying out.

Some of the interesting features of American dialect speech are the wealth of ancient or historical words, now extinct in the literary language, that linger in remote regions; localisms of vocabulary; pronominal, verbal and other grammatical peculiarities; colourful exclamations and interjections in great numbers; varied and numerous indefinite terms used to avoid finding a specific one; terms of disparagement and of encomium; ablaut or rhyming compounds; saws; proverbs; striking similes or metaphors. There are popular names, needing special compilation by folklorists, for birds, insects and plants. A study of dialect has social as well as linguistic significance, since the customs, superstitions and daily interests of a community are reflected in its speech.

The dialects or special jargons of separate classes or professions, as apart from regional dialects, may be illustrated by the vocabularies of hoboes, crooks, vagabonds, drug addicts, the vocabularies of oil-well workers, loggers, miners, sailors, vaudeville artists, actors, circus employees, moving-picture people. The special jargons developed by educators, sociologists, psychologists and other professional groups of various types are also sometimes termed dialects.

An American Dialect Society was formed in 1899, and it has collected a large amount of material. In 1927 it began the preparation of an American dialect dictionary, to be made in cooperation with the Historical Dictionary of American English, in progress at the University of Chicago. (L. P.)

ENGLISH LAW. In the language of English jurisprudence "legal memory" is said to extend as far as, but no further than, the coronation of Richard I. (Sept. 3, 1189). This is a technical doctrine concerning prescriptive rights, but is capable of expressing an important truth. For the last seven centuries, little more or less, English law has had not only an extremely continuous, but a matchlessly well-attested history, and, moreover, has been the subject matter of rational exposition. Already in 1194 the daily doings of a tribunal which was controlling and moulding the whole system were being punctually recorded in letters yet legible, and from that time onwards it is rather the enormous bulk than any dearth of available materials that prevents us from tracing the transformation of every old doctrine and the emergence and expansion of every new idea. If we are content to look no further than the text-books—the books written by lawyers for lawyers—we may read our way backwards to Blackstone (d. 1780), Hale (d. 1676), Coke (d. 1634), Fitzherbert (d. 1538), Littleton (d. 1481), Bracton (d. 1268), Glanvill (d. 1190), until we are in the reign of Henry of Anjou, and yet shall perceive that we are always reading of one and the same body of law, though the little body has become great, and the ideas that were few and indefinite have become many and explicit.

Beyond these seven lucid centuries lies a darker period. Nearly six centuries will still divide us from the dooms of Aethelbert (*c.* 600), and nearly seven from the *Lex Salica* (*c.* 500). We may regard the Norman conquest of England as marking the confluence of two streams of law. The one we may call French or Frankish. If we follow it upwards we pass through the capitularies of Carlovingian emperors and Merovingian kings until we see Chlodwig and his triumphant Franks invading Gaul, submitting their Sicambrian necks to the yoke of the imperial religion, and putting their traditional usages into written Latin. The other rivulet we may call Anglo-Saxon. Pursuing it through the code of Canute (d. 1035) and the ordinances of Alfred (*c.* 900) and his successors, we see Ine publishing laws in the newly converted Wessex (*c.* 690), and, almost a century earlier, Aethelbert doing the same in the newly converted Kent (*c.* 600). This he did, says Beda, in accordance with Roman precedents. Perhaps from the Roman missionaries he had heard tidings of what the Roman emperor had lately been doing far off in New Rome. We may at any rate notice with interest that in order of time Justinian's law-books fall between the *Lex Salica* and the earliest Kentish dooms; also that the great pope who sent Augustine to England is one of the very few men who between Justinian's day and the 11th century lived in the Occident and yet can be proved to have known the Digest. In the Occident the time for the Germanic "folk-laws" (*Leges Barbarorum*) had come, and a Canon law, ambitious of independence, was being constructed, when in the Orient the lord of church and State was "enucleating" all that was to live of the classical jurisprudence of pagan Rome. It was but a brief interval between Gothic and Lombardic domination that enabled him to give law to Italy: Gaul and Britain were beyond his reach.

The Anglo-Saxon laws that have come down to us (and we have no reason to fear the loss of much beyond some dooms of the Mercian Offa) are best studied as members of a large Teutonic family. Those that proceed from the Kent and Wessex of the 7th century are closely related to the Continental folk-laws. Their next of kin seem to be the *Lex Saxonum* and the laws of the Lombards. Then, though the 8th and 9th centuries are unproductive, we have from Alfred (*c.* 900) and his successors a series of edicts which strongly resemble the Frankish capitularies—so strongly that we should see a clear case of imitation, were it not that in Frankland the age of legislation had come to its disastrous end long before Alfred was king. This, it may be noted, gives to English legal history a singular continuity from Alfred's day to our own. The king of the English was expected to publish laws at a time when hardly anyone else was attempting any such feat, and the English dooms of Canute the Dane are probably the most comprehensive statutes that were issued in the Europe of the 11th century. No genuine laws of the sainted Edward have descended to us, and during his reign England seems but too likely to follow the bad example of Frankland, and become a loose congeries of lordships. From this fate it was saved by the Norman duke, who, like Canute before him, subdued a land in which kings were still expected to publish laws.

In the study of early Germanic law—a study which now for some considerable time has been scientifically prosecuted in Germany—the Anglo-Saxon dooms have received their due share of attention. A high degree of racial purity may be claimed on their behalf. Celtic elements have been sought for in them, but have never been detected. At certain points, notably in the regulation of the blood-feud and the construction of a tariff of atonements, the law of one rude folk will always be somewhat like the law of another; but the existing remains of old Welsh and old Irish law stand far remoter from the dooms of Aethelbert and Ine than stand the edicts of Rothari and Liutprand, kings of the Lombards. Indeed, it is very dubious whether distinctively Celtic customs play any considerable part in the evolu-

tion of that system of rules of Anglian, Scandinavian and Frankish origin which becomes the law of Scotland. Within England itself, though for a while there was fighting enough between the various Germanic folks, the tribal differences were not so deep as to prevent the formation of a common language and a common law. Even the strong Scandinavian strain seems to have rapidly blended with the Anglian. It amplified the language and the law, but did not permanently divide the country. If, for example, we can to-day distinguish between *law* and *right,* we are debtors to the Danes; but very soon *law* is not distinctive of eastern or *right* of western England. In the first half of the 12th century a would-be expounder of the law of England had still to say that the country was divided between the Wessex law, the Mercian law and the Danes' law, but he had also to point out that the law of the king's own court stood apart from and above all partial systems. The local customs were those of shires and hundreds, and shaded off into each other. We may speak of more Danish and less Danish counties; it was a matter of degree; for rivers were narrow and hills were low. England was meant by nature to be the land of one law.

Then as to Roman law. In England and elsewhere Germanic law developed in an atmosphere that was charged with traditions of the old world, and many of these traditions had become implicit in the Christian religion. It might be argued that all that we call progress is due to the influence exercised by Roman civilization; that, were it not for this, Germanic law would never have been set in writing; and that theoretically unchangeable custom would never have been supplemented or superseded by express legislation. All this and much more of the same sort might be said; but the survival in Britain, or the reintroduction into England, of anything that we should dare to call Roman jurisprudence would be a different matter. Eyes, carefully trained, have minutely scrutinized the Anglo-Saxon legal texts without finding the least trace of a Roman rule outside the ecclesiastical sphere. Even within that sphere modern research is showing that the church-property-law of the middle ages, the law of the ecclesiastical "benefice," is permeated by Germanic ideas. This is true of Gaul and Italy, and yet truer of an England in which Christianity was for a while extinguished. Moreover, the laws that were written in England were, from the first, written in the English tongue; and this gives them a unique value in the eyes of students of Germanic folk-law, for even the very ancient and barbarous *Lex Salica* is a Latin document, though many old Frankish words are enshrined in it. Also we notice—and this is of grave importance—that in England there are no vestiges of any "Romani" who are being suffered to live under their own law by their Teutonic rulers. On the Continent we may see Gundobad, the Burgundian, publishing one law-book for the Burgundians and another for the Romani who own his sway. A book of laws, excerpted chiefly from the Theodosian code, was issued by Alaric the Visigoth for his Roman subjects before the days of Justinian, and this book (the so-called *Breviarium Alarici* or *Lex Romana Visigothorum*) became for a long while the chief representative of Roman law in Gaul. The Frankish king in his expansive realm ruled over many men whose law was to be found not in the *Lex Salica* or *Lex Ribuaria,* but in what was called the *Lex Romana.* "A system of personal law" prevailed: the *homo Romanus* handed on his Roman law to his children, while Frankish or Lombardic, Swabian or Saxon law would run in the blood of the *homo barbarus.* Of all this we hear nothing in England. Then on the mainland of Europe Roman and barbarian law could not remain in juxtaposition without affecting each other. On the one hand we see distinctively Roman rules making their way into the law of the victorious tribes, and on the other hand we see a decay and debasement of jurisprudence which ends in the formation of what modern historians have called a Roman "vulgar-law" (*Vulgarrecht*). For a short age which centres round the year 800 it seemed possible that Frankish kings, who were becoming Roman emperors, would be able to rule by their capitularies nearly the whole of the Christian Occident. The dream vanished before fratricidal wars, heathen invaders, centrifugal feudalism and a centripetal church which found its law in the newly concocted forgeries of the Pseudo-Isidore (*c.* 850). The "personal laws" began to transmute themselves into local customs, and the Roman vulgar-law began to look like the local custom of those districts where the Romani were the preponderating element in the population. Meanwhile, the Norse pirates subdued a large tract of what was to be northern France—a land where Romani were few. Their restless and boundless vigour these Normans retained; but they showed a wonderful power of appropriating whatever of alien civilization came in their way. In their language, religion and law, they had become French many years before they subdued England. It is a plausible opinion that among them there lived some sound traditions of the Frankish monarchy's best days, and that Norman dukes, rather than German emperors or kings of the French, are the truest spiritual heirs of Charles the Great.

The Norman Age.—In our own day German historians are wont to speak of English law as a "daughter" of French or Frankish law. This tendency derived its main impulse from H. Brunner's proof that the germ of trial by jury, which cannot be found in the Anglo-Saxon laws, can be found in the prerogative procedure of the Frankish kings. We must here remember that during a long age English lawyers wrote in French and even thought in French, and that to this day most of the technical terms of the law, more especially of the private law, are of French origin. Also it must be allowed that when English law has taken shape in the 13th century it is very like one of the *coutumes* of northern France. Even when linguistic difficulties have been surmounted, the Saxon Mirror of Eike von Repgow will seem far less familiar to an Englishman than the so-called Establishments of St. Louis. This was the outcome of a slow process which fills more than a century (1066–1189), and was in a great measure due to the reforming energy of Henry II., the French prince who, in addition to England, ruled a good half of France. William the Conqueror seems to have intended to govern Englishmen by English law. After the tyranny of Rufus, Henry I. promised a restoration of King Edward's law: that is, the law of the Confessor's time (*Legem Eadwardi regis vobis reddo*). Various attempts were then made, mostly, so it would seem, by men of French birth, to state in a modern and practicable form the *laga Eadwardi* which was thus restored. The result of their labours is an intricate group of legal tracts which has been explored of late years by Dr. Liebermann. The best of these has long been known as the *Leges Henrici Primi,* and aspires to be a comprehensive law-book. Its author, though he had some foreign sources at his command, such as the *Lex Ribuaria* and an epitome of the Breviary of Alaric, took the main part of his matter from the code of Canute and the older English dooms. Neither the Conqueror nor either of his sons had issued many ordinances: the invading Normans had little, if any, written law to bring with them, and had invaded a country where kings had been lawgivers. Moreover, there was much in the English system that the Conqueror was keenly interested in retaining—especially an elaborate method of taxing the land and its holders. The greatest product of Norman government, the grandest feat of government that the world had seen for a long time past, the compilation of *Domesday Book,* was a conservative effort, an attempt to fix upon every landholder, French or English, the amount of geld that was due from his predecessor in title. Himself the rebellious vassal of the French king, the duke of the Normans, who had become king of the English, knew much of disruptive feudalism, and had no mind to see England that other France which it had threatened to become in the days of his pious but incompetent cousin. The sheriffs, though called *vice-comites,* were to be the king's officers; the shire-moots might be called county courts, but were not to be the courts of counts. Much that was sound and royal in English public law was to be preserved if William could preserve it.

Royal Justice.—The gulf that divides the so-called *Leges Henrici* (*c.* 1115) from the text-book ascribed to Ranulf Glanvill (*c.* 1188) seems at first sight very wide. The one represents a not easily imaginable chaos and clash of old rules and new; it represents also a stage in the development of feudalism which

in other countries is represented chiefly by a significant silence. The other is an orderly, rational book, which through all the subsequent centuries will be readily understood by English lawyers. Making no attempt to tell us what goes on in the local courts, its author, who may be Henry II.'s chief justiciar, Ranulf Glanvill, or may be Glanvill's nephew, Hubert Walter, fixes our attention on a novel element which is beginning to subdue all else to its powerful operation. He speaks to us of the justice that is done by the king's own court. Henry II. had opened the doors of his French-speaking court to the mass of his subjects. Judges chosen for their ability were to sit there, term after term; judges were to travel in circuits through the land, and in many cases the procedure by way of "an inquest of the country," which the Norman kings had used for the ascertainment of their fiscal rights, was to be at the disposal of ordinary litigants. All this had been done in a piecemeal, experimental fashion by ordinances that were known as "assizes." There had not been, and was not to be, any enunciation of a general principle inviting all who were wronged to bring in their own words their complaints to the king's audience. The general prevalence of feudal justice, and of the world-old methods of supernatural probation (ordeals, battle, oaths sworn with oath-helpers), was to be theoretically respected; but in exceptional cases, which would soon begin to devour the rule, a royal remedy was to be open to any one who could frame his case within the compass of some carefully-worded and prescript formula. With allusion to a remote stage in the history of Roman law, a stage of which Henry's advisers can have known little or nothing, we may say that a "formulary system" is established which will preside over English law until modern times. Certain actions, each with a name of its own, are open to litigants. Each has its own formula set forth in its original (or, as we might say, originating) writ; each has its own procedure and its appropriate mode of trial. The litigant chooses his writ, his action, and must stand or fall by his choice. Thus a book about royal justice tends to become, and Glanvill's book already is, a commentary on original writs.

The precipitation of English law in so coherent a form as that which it has assumed in Glanvill's book is not to be explained without reference to the revival of Roman jurisprudence in Italy. Out of a school of Lombard lawyers at Pavia had come Lanfranc the Conqueror's adviser, and the Lombardists had already been studying Justinian's Institutes. Then at length the Digest came by its rights. About the year 1100 Irnerius was teaching at Bologna, and from all parts of the West men were eagerly flocking to hear the new gospel of civilization. About the year 1149 Vacarius was teaching Roman law in England. The rest of a long life he spent here, and faculties of Roman and Canon law took shape in the nascent University of Oxford. Whatever might be the fate of Roman law in England, there could be no doubt that the Canon law, which was crystallizing in the *Decretum Gratiani* (*c.* 1139) and in the decretals of Alexander III., would be the law of the English ecclesiastical tribunals. The great quarrel between Henry II. and Thomas of Canterbury brought this system into collision with the temporal law of England, and the king's ministers must have seen that they had much to learn from the methodic enemy. Some of them were able men who became the justices of Henry's court, and bishops to boot. The luminous *Dialogue of the Exchequer* (*c.* 1179), which expounds the English fiscal system, came from the treasurer, Richard Fitz Nigel, who became bishop of London; and the treatise on the laws of England came perhaps from Glanvill, perhaps from Hubert Walter, who was to be both primate and chief justiciar. There was healthy emulation of the work that was being done by Italian jurists, but no meek acceptance of foreign results.

Bracton.—A great constructive era had opened, and its outcome was a large and noble book. The author was Henry of Bratton (his name has been corrupted into Bracton), who died in 1268 after having been for many years one of Henry III.'s justices. The model for its form was the treatise of Azo of Bologna ("master of all the masters of the laws," an Englishman called him), and thence were taken many of the generalities of jurisprudence: maxims that might be regarded as of universal and natural validity. But the true core of the work was the practice of an English court which had yearly been extending its operations in many directions. For half a century past diligent record had been kept on parchment of all that this court had done, and from its rolls Bracton cited numerous decisions. He cited them as precedents, paying special heed to the judgments of two judges who were already dead, Martin Pateshull and William Raleigh. For this purpose he compiled a large Note Book, which was discovered by Prof. Vinogradoff in the British Museum in 1884. Thus at a very early time English "common law" shows a tendency to become what it afterwards definitely became, namely, "case law." The term "common law" was being taken over from the canonists by English lawyers, who used it to distinguish the general law of the land from local customs, royal prerogatives, and in short from all that was exceptional or special. Since statutes and ordinances were still rarities, all expressly enacted laws were also excluded from the English lawyers' notion of "the common law." The Great Charter (1215) had taken the form of a grant of "liberties and privileges," comparable to the grants that the king made to individual men and favoured towns. None the less, it was in that age no small body of enacted law, and, owing to its importance and solemnity, it was in after ages regarded as the first article of a statute book. There it was followed by the "provisions" issued at Merton in 1236 and by those issued at Marlborough after the end of the Barons' war. But during Henry III.'s long reign the swift development of English law was due chiefly to new "original writs" and new "forms of action" devised by the chancery and sanctioned by the court. Bracton knew many writs that were unknown to Glanvill, and men were already perceiving that limits must be set to the inventive power of the chancery unless the king was to be an uncontrollable law-maker. Thus the common law was losing the power of rapid growth when Bracton summed the attained results in a book, the success of which is attested by a crowd of manuscript copies. Bracton had introduced just enough of Roman law and Bolognese method to save the law of England from the fate that awaited German law in Germany. His book was printed in 1569, and Coke owed much to Bracton.

Reign of Edward I.—The comparison that is suggested when Edward I. is called the English Justinian cannot be pressed very far. Nevertheless, as is well known, it is in his reign (1272–1307) that English institutions finally take the forms they are to keep through coming centuries. We already see the parliament of the three estates, the convocations of the clergy, the king's council, the chancery or secretarial department, the exchequer or financial department, the king's bench, the common bench, the commissioners of assize and gaol delivery, the small group of professionally learned judges, and a small group of professionally learned lawyers, whose skill is at the service of those who will employ them. Moreover, the statutes that were passed in the first 18 years of the reign, though their bulk seems slight to us nowadays, bore so fundamental a character that in subsequent ages they appeared as the substructure of huge masses of superincumbent law. Coke commented upon them sentence by sentence, and even now the merest smatterer in English law must profess some knowledge of *Quia emptores* and *De donis conditionalibus*. If some American States have, while others have not, accepted these statutes, that is a difference which is not unimportant to citizens of the United States in the 20th century. Then from the early years of Edward's reign come the first "law reports" that have descended to us: the oldest of them have not yet been printed; the oldest that has been printed belongs to 1292. These are the precursors of the long series of Year Books (Edw. II.–Hen. VIII.) which runs through the residue of the middle ages. Lawyers, we perceive, are already making and preserving notes of the discussions that take place in court; French notes that will be more useful to them than the formal Latin records inscribed upon the plea rolls. From these reports we learn that there are already, as we should say, a few "leading counsel," some of whom will be retained in almost every important cause. Papal decretals had been endeavouring to withdraw the clergy from secular employment. The clerical element had been strong

among the judges of Henry III.'s reign: Bracton was an archdeacon, Pateshull a dean, Raleigh died a bishop. Their places begin to be filled by men who are not in orders, but who have pleaded the king's causes for him—his serjeants or servants at law—and beside them there are young men who are "apprentices at law," and are learning to plead. Also we begin to see men who, as "attorneys at law," are making it their business to appear on behalf of litigants. The history of the legal profession and its monopoly of legal aid is intricate, and at some points still obscure; but the influence of the canonical system is evident: the English attorney corresponds to the canonical proctor, and the English barrister to the canonical advocate. The main outlines were being drawn in Edward I.'s day; the legal profession became organic, and professional opinion became one of the main forces that moulded the law.

The study of English law fell apart from all other studies, and the impulse that had flowed from Italian jurisprudence was ebbing. We have two comprehensive text-books from Edward's reign: the one known to us as *Fleta,* the other as *Britton;* both of them, however, quarry their materials from Bracton's treatise. Also we have two little books on procedure which are attributed to Chief Justice Hengham, and a few other small tracts of an intensely practical kind. Under the cover of fables about King Alfred, the author of the *Mirror of Justices* made a bitter attack upon King Edward's judges, some of whom had fallen into deep disgrace. English legal history has hardly yet been purged of the leaven of falsehood that was introduced by this fantastic and unscrupulous pamphleteer. His enigmatical book ends that literate age which begins with Glanvill's treatise and the treasurer's dialogue. Between Edward I.'s day and Edward IV.'s hardly anything that deserves the name of book was written by an English lawyer.

The 14th and 15th Centuries.—During that time the body of statute law was growing, but not very rapidly. Acts of parliament intervened at a sufficient number of important points to generate and maintain a persuasion that no limit, or no ascertainable limit, can be set to the legislative power of king and parliament. Very few are the signs that the judges ever permitted the validity of a statute to be drawn into debate. Thus the way was being prepared for the definite assertion of parliamentary "omnicompetence" which we obtain from the Elizabethan statesman, Sir Thomas Smith, and for those theories of sovereignty which we couple with the names of Hobbes and Austin. Nevertheless, English law was being developed rather by debates in court than by open legislation. The most distinctively English of English institutions in the later middle ages are the Year Books and the Inns of Court. Year by year, term by term, lawyers were reporting cases in order that they and their fellows might know how cases had been decided. The allegation of specific precedents was indeed much rarer than it afterwards became, and no calculus of authority so definite as that which now obtains had been established in Coke's day, far less in Littleton's. Still it was by a perusal of reported cases that a man would learn the law of England. A skeleton for the law was provided, not by the Roman rubrics (such as public and private, real and personal, possessory and proprietary, contract and delict), but by the cycle of original writs that were inscribed in the chancery's *Registrum Brevium.* A new form of action could not be introduced without the authority of parliament, and the growth of the law took the shape of an explication of the true intent of ancient formulas. Times of inventive liberality alternated with times of cautious and captious conservatism. Coke could look back to Edward III.'s day as to a golden age of good pleading. The otherwise miserable time which saw the Wars of the Roses produced some famous lawyers, and some bold doctrines which broke new ground. It produced also Sir Thomas Littleton's (d. 1481) treatise on Tenures, which (though it be not, as Coke thought it, the most perfect work that ever was written in any human science) is an excellent statement of law in exquisitely simple language. Meanwhile English law was being scholastically taught. (*See* LEGAL EDUCATION.)

Chancery.—A danger threatened: the danger that a prematurely osseous system of common law would be overwhelmed by summary justice and royal equity. Even when courts for all ordinary causes had been established, a reserve of residuary justice remained with the king. Whatever lawyers and even parliaments might say, it was seen to be desirable that the king in council should with little regard for form punish offenders who could break through the meshes of a tardy procedure and should redress wrongs which corrupt and timid juries would leave unrighted. Papal edicts against heretics had made familiar to all men the notion that a judge should at times proceed *summarie et de plano et sine strepitu et figura justitiae.* And so extraordinary justice of a penal kind was done by the king's council upon misdemeanants, and extraordinary justice of a civil kind was ministered by the king's chancellor (who was the specially learned member of the council) to those who "for the love of God and in the way of charity," craved his powerful assistance. It is now well established that the chancellors started upon this course, not with any desire to introduce rules of "equity" which should supplement, or perhaps supplant, the rules of law, but for the purpose of driving the law through those accidental impediments which sometimes unfortunately beset its due course. The wrongs that the chancellor redressed were often wrongs of the simplest and most brutal kind: assaults, batteries and forcible dispossessions. However, he was warned off this field of activity by parliament; the danger to law, to lawyers, to trial by jury, was evident. But just when this was happening, a new field was being opened for him by the growing practice of conveying land to trustees. The English trust of land had ancient Germanic roots, and of late we have been learning how in far-off centuries our Lombard cousins were in effect giving themselves a power of testation by putting their lands in trust. In England, when the forms of action were crystallizing, this practice had not been common enough to obtain the protection of a writ; but many causes conspired to make it common in the 14th century; and so, with the general approval of lawyers and laity, the chancellors began to enforce by summary process against the trustee the duty that lay upon his conscience. In the next century it was clear that England had come by a new civil tribunal. Negatively, its competence was defined by the rule that when the common law offered a remedy, the chancellor was not to intervene. Positively, his power was conceived as that of doing what "good conscience" required, more especially in cases of "fraud, accident or breach of confidence." His procedure was the summary, the heresy-suppressing (not the ordinary and solemn) procedure of an ecclesiastical court; but there are few signs that he borrowed any substantive rules from legist or decretist, and many proofs that within the new field of trust he pursued the ideas of the common law. It was long, however, before lawyers made a habit of reporting his decisions. He was not supposed to be tightly bound by precedent. Adaptability was of the essence of the justice that he did.

The Tudor Age.—A time of strain and trial came with the Tudor kings. It was questionable whether the strong "governance" for which the weary nation yearned could work within the limits of a parliamentary system, or would be compatible with the preservation of the common law. We see new courts appropriating large fields of justice and proceeding *summarie et de plano;* the star chamber, the chancery, the courts of requests, of wards, of augmentations, the councils of the North and Wales; a little later we see the high commission. We see also that judicial torture which Fortescue had called the road to hell. The stream of law reports became intermittent under Henry VIII.; few judges of his or his son's reign left names that are to be remembered. In an age of humanism, alphabetically arranged "abridgments" of mediaeval cases were the best work of English lawyers: one comes to us from Anthony Fitzherbert (d. 1538), and another from Robert Broke (d. 1558). This was the time when Roman law swept like a flood over Germany. The modern historian of Germany will speak of "the Reception" (that is, the reception of Roman law), as no less important than the Renaissance and Reformation with which it is intimately connected. Very probably he will bestow hard words on a movement which disintegrated the nation and consolidated the tyranny of the princelings.

Now a project that Roman law should be "received" in England occurred to Reginald Pole (d. 1558), a humanist, and at one time a reformer, who with good fortune might have been either king of England or pope of Rome. English law, said the future cardinal and archbishop, was barbarous; Roman law was the very voice of nature pleading for "civility" and good princely governance. Pole's words were brought to the ears of his majestic cousin, and, had the course of events been somewhat other than it was, King Henry might well have decreed a reception. The rôle of English Justinian would have perfectly suited him, and there are distinct traces of the civilian's Byzantinism in the doings of the Church of England's supreme head. The academic study of the Canon law was prohibited; regius professorships of the civil law were founded; civilians were to sit as judges in the ecclesiastical courts. A little later, the protector Somerset was deeply interested in the establishment of a great school for civilians at Cambridge. Scottish law was the own sister of English law, and yet in Scotland we may see a reception of Roman jurisprudence which might have been more whole-hearted than it was, but for the drift of two British and Protestant kingdoms towards union. As it fell out, however, Henry could get what he wanted in Church and State without any decisive supersession of English by foreign law. The omnicompetence of an Act of parliament stands out the more clearly if it settles the succession to the throne, annuls royal marriages, forgives royal debts, defines religious creeds, attaints guilty or innocent nobles, or prospectively lends the force of statute to the king's proclamations. The courts of common law were suffered to work in obscurity, for jurors feared fines, and matter of State was reserved for council or Star Chamber. The Inns of Court were spared; their moots and readings did no perceptible harm, if little perceptible good.

Coke and Selden.—Yet it is no reception of alien jurisprudence that must be chronicled, but a marvellous resuscitation of English mediaeval law. We may see it already in the Commentaries of Edward Plowden (d. 1585) who reported cases at length and lovingly. Bracton's great book was put in print, and was a key to much that had been forgotten or misunderstood. Under Parker's patronage, even the Anglo-Saxon dooms were brought to light; they seemed to tell of a Church of England that had not yet been enslaved by Rome. The new national pride that animated Elizabethan England issued in boasts touching the antiquity, humanity, enlightenment of English law. Resuming the strain of Fortescue, Sir Thomas Smith, himself a civilian, wrote concerning the Commonwealth of England a book that claimed the attention of foreigners for her law and her polity. There was dignified rebuke for the French jurist who had dared to speak lightly of Littleton. And then the common law took flesh in the person of Edward Coke (1552–1634). With an enthusiastic love of English tradition, for the sake of which many offences may be forgiven him, he ranged over nearly the whole field of law, commenting, reporting, arguing, deciding—disorderly, pedantic, masterful, an incarnate national dogmatism tenacious of continuous life. Imbued with this new spirit, the lawyers fought the battle of the Constitution against James and Charles, and historical research appeared as the guardian of national liberties. That the Stuarts united against themselves three such men as Edward Coke, John Selden and William Prynne, is the measure of their folly and their failure. Words that, rightly or wrongly, were ascribed to Bracton rang in Charles's ears when he was sent to the scaffold. For the modern student of mediaeval law many of the reported cases of the Stuart time are storehouses of valuable material, since the lawyers of the 17th century were mighty hunters after records. Prynne (d. 1669), the fanatical Puritan, published ancient documents with fervid zeal, and made possible a history of parliament. Selden (d. 1654) was in all Europe among the very first to write legal history as it should be written. His book about tithes is to this day a model and a masterpiece. When this accomplished scholar had declared that he had laboured to make himself worthy to be called a common lawyer, it could no longer be said that the common lawyers were *indoctissimum genus doctissimorum hominum*. Even pliant judges, whose tenure of office depended on the king's will, were compelled to cite and discuss old precedents before they could give judgment for their master; and even at their worst moments they would not openly break with mediaeval tradition, or declare in favour of that "modern police-State" which has too often become the ideal of foreign publicists trained in Byzantine law.

The 18th Century.—The current of legal doctrine was by this time so strong and voluminous that such events as the Civil War, the Restoration and the Revolution hardly deflected the course of the stream. In retrospect, Charles II. reigns so soon as life has left his father's body, and James II. ends a lawless career by a considerate and convenient abdication. The statute book of the restored king was enriched by leaves excerpted from the acts of a lord protector; and Matthew Hale (d. 1676), who was, perhaps, the last of the great record-searching judges, sketched a map of English law which Blackstone was to colour. Then a time of self-complacency came for the law, which knew itself to be the perfection of wisdom, and any proposal for drastic legislation would have worn the garb discredited by the tyranny of the Puritan Caesar. The need for the yearly renewal of the Mutiny Act secured an annual session of parliament. The mass of the statute law made in the 18th century is enormous; but, even when we have excluded from view such acts as are technically called "private," the residuary matter bears a wonderfully empirical, partial and minutely particularizing character. In this "age of reason," as we are wont to think it, the British parliament seems rarely to rise to the dignity of a general proposition, and in our own day the legal practitioner is likely to know less about the statutes of the 18th century than he knows about the statutes of Edward I., Henry VIII. and Elizabeth. Parliament, it should be remembered, was endeavouring directly to govern the nation. There was little that resembled the permanent civil service of to-day. The choice lay between direct parliamentary government and royal "prerogative"; and lengthy statutes did much of that work of detail which would now be done by virtue of the powers that are delegated to ministers and governmental boards. Moreover, extreme and verbose particularity was required in statutes, for judges were loath to admit that the common law was capable of amendment. A vague doctrine, inherited from Coke, taught that statutes might be so unreasonable as to be null, and any political theory that seemed to derive from Hobbes would have been regarded with not unjust suspicion. But the doctrine in question never took tangible shape, and enough could be done to protect the common law by a niggardly exposition of every legislating word. It is to be remembered that some main features of English public law were attracting the admiration of enlightened Europe. When Voltaire and Montesquieu applauded, the English lawyer had cause for complacency.

The common law was by no means stagnant. Many rules which come to the front in the 18th century are hardly to be traced farther. Especially is this the case in the province of mercantile law, where the earl of Mansfield's (d. 1793) long presidency over the king's bench marked an epoch. It is too often forgotten that, until Elizabeth's reign, England was a thoroughly rustic kingdom, and that trade with England was mainly in the hands of foreigners. Also in mediaeval fairs, the assembled merchants declared their own "law merchant," which was considered to have a supernational validity. In the reports of the common law courts it is late in the day before we read of some mercantile usages which can be traced far back in the statutes of Italian cities. Even on the basis of the excessively elaborated land law—a basis which Coke's Commentary on Littleton seemed to have settled for ever—a lofty and ingenious superstructure could be reared. One after another delicate devices were invented for the accommodation of new wants within the law; but only by the assurance that the old law could not be frankly abolished can we be induced to admire the subtlety that was thus displayed. As to procedure, it had become a maze of evasive fictions, to which only a few learned men held the historical clue. By fiction the courts had stolen business from each other, and by fiction a few comparatively speedy forms of action were set to tasks for which they were not originally framed. Two fictitious persons, John Doe and Richard Roe, reigned supreme. On the other hand, that healthy and vigorous institution,

the Commission of the Peace, with a long history behind it, was giving an important share in the administration of justice to numerous country gentlemen who were thus compelled to learn some law. A like beneficial work was being done among jurors, who, having ceased to be regarded as witnesses, had become "judges of fact." No one doubted that trial by jury was the "palladium" of English liberties, and popularity awaited those who would exalt the office of the jurors and narrowly limit the powers of the judge.

Equity.—But during this age the chief addition to English jurisprudence was made by the crystallization of the chancellor's equity. In the 17th century the chancery had a narrow escape from sharing the fate that befell its twin sister the Star Chamber. Its younger sister the court of requests perished under the persistent attacks of the common lawyers. Having outlived troubles, the chancery took to orderly habits, and administered under the name of "equity" a growing group of rules, which in fact were supplemental law. Stages in this process are marked by the chancellorships of Nottingham (1673–75) and Hardwicke (1737–56). Slowly a continuous series of Equity Reports began to flow, and still more slowly an "equity bar" began to form itself. The principal outlines of equity were drawn by men who were steeped in the common law. By way of ornament a Roman maxim might be borrowed from a French or Dutch expositor, or a phrase which smacked of that "nature-rightly" school which was dominating continental Europe; but the influence exercised by Roman law upon English equity has been the subject of gross exaggeration. Parliament and the old courts being what they were, perhaps it was only in a new court that the requisite new law could be evolved. The result was not altogether satisfactory. Freed from contact with the plain man in the jury-box, the chancellors were tempted to forget how plain and rough good law should be, and to screw up the legal standard of reasonable conduct to a height hardly attainable except by those whose purses could command the constant advice of a family solicitor. A court which started with the idea of doing summary justice for the poor became a court which did a highly refined, but tardy justice, suitable only to the rich. (*See* EQUITY.)

Blackstone.—About the middle of the century William Blackstone, then a disappointed barrister, began to give lectures on English law at Oxford (1758), and soon afterwards he began to publish (1765) his *Commentaries*. Accurate enough in its history and doctrine to be an invaluable guide to professional students and a useful aid to practitioners, his book set before the unprofessional public an artistic picture of the laws of England such as had never been drawn of any similar system. No nation but the English had so eminently readable a law-book, and it must be doubtful whether any other lawyer ever did more important work than was done by the first professor of English law. Over and over again the *Commentaries* were edited, sometimes by distinguished men, and it is hardly too much to say that for nearly a century the English lawyer's main ideas of the organization and articulation of the body of English law were controlled by Blackstone. This was far from all. The Tory lawyer little thought that he was giving law to colonies that were on the eve of a great and successful rebellion. Yet so it was. In America, where books were few and lawyers had a mighty task to perform, Blackstone's facile presentment of the law of the mother country was of inestimable value. It has been said that among American lawyers the *Commentaries* "stood for the law of England," and this at a time when the American daughter of English law was rapidly growing in stature, and was preparing herself for her destined march from the Atlantic to the Pacific ocean. Excising only what seemed to savour of oligarchy, those who had defied King George retained with marvellous tenacity the law of their forefathers. Profound discussions of English mediaeval law have been heard in American courts; admirable researches into the recesses of the Year-Books have been made in American law schools; the names of the great American judges are familiar in an England which knows little indeed of foreign jurists; and the debt due for the loan of Blackstone's *Commentaries* is being fast repaid. Lectures on the common law delivered by Mr. Justice Holmes of the Supreme Court of the United States may even have begun to turn the scale against the old country. No chapter in Blackstone's book nowadays seems more antiquated than that which describes the modest territorial limits of that English law which was to spread throughout Australia and New Zealand and to follow the dominant race in India.

Bentham.—Long wars, vast economic changes and the conservatism generated by the French Revolution piled up a monstrous arrear of work for the English legislature. Meanwhile, Jeremy Bentham (d. 1832) had laboured for the overthrow of much that Blackstone had lauded. Bentham's largest projects of destruction and reconstruction took but little effect. Profoundly convinced of the fungibility and pliability of mankind, he was but too ready to draw a code for England or Spain or Russia at the shortest notice; and, scornful as he was of the past and its historic deposit, a code drawn by Bentham would have been a sorry failure. On the other hand, as a critic and derider of the system which Blackstone had complacently expounded he did excellent service. Reform, and radical reform, was indeed sadly needed throughout a system which was encumbered by noxious rubbish, the useless leavings of the middle ages: trial by battle and compurgation, deodands and benefit of clergy, John Doe and Richard Roe. It is perhaps the main fault of "judge-made law" (to use Bentham's phrase) that its destructive work can never be cleanly done. Of all vitality, and therefore of all patent harmfulness, the old rule can be deprived, but the moribund husk must remain in the system doing latent mischief. English law was full of decaying husks when Bentham attacked it, and his persistent demand for reasons could not be answered. At length a general interest in "law reform" was excited; Romilly and Brougham were inspired by Bentham, and the great changes in constitutional law which cluster round the Reform Act of 1832 were accompanied by many measures which purged the private, procedural and criminal law of much, though hardly enough, of the mediaeval dross. Some credit for rousing an interest in law, in definitions of legal terms, and in schemes of codification, is due to John Austin (d. 1859) who was regarded as the jurist of the reforming and utilitarian group. But, though he was at times an acute dissector of confused thought, he was too ignorant of the English, the Roman and every other system of law to make any considerable addition to the sum of knowledge; and when Savigny, the herald of evolution, was already in the field, the day for a "Nature-Right"—and Austin's projected "general jurisprudence" would have been a Nature-Right—was past beyond recall. The obsolescence of the map of law which Blackstone had inherited from Hale, and in which many outlines were drawn by mediaeval formulas, left intelligent English lawyers without a guide, and they were willing to listen for a while to what in their insularity they thought to be the voice of cosmopolitan science. Little came of it all. The revived study of Germanic law in Germany, which was just beginning in Austin's day, seems to be showing that the scheme of Roman jurisprudence is not the scheme into which English law will run without distortion.

ENGLISH LITERATURE. The following discussion of the evolution of English literature is planned to give a comprehensive view, the details as to particular authors and their work being reserved for separate articles. As the precise delimitation of what may narrowly be called "English" literature, *i.e.*, in the English language, is perhaps impossible, the reader is referred to supplementary articles on the literature of Scotland, Ireland, Wales, Canada and the United States, and to such general accounts of particular forms as NOVEL; ROMANCE; VERSE, etc.

I. EARLIEST TIMES TO CHAUCER

Though there is no evidence either that the heathen English had adopted the Roman alphabet, or that they had learned to employ their native monumental script (the runes) on materials suitable for continuous writing, it is certain that in the pre-literary period at least one species of poetic art had attained a high degree of development, and that an extensive body of poetry was handed down. This unwritten poetry was the work of minstrels who found their audiences in the halls of kings and nobles. Its themes were the exploits of heroes of Germanic Europe, with which its listeners claimed kinship. Its metre was the alliterative long line, the lax rhythm of which shows that it was intended, not to be sung to regular melodies, but to be recited. Of its beauty and power we may judge from the best passages in *Beowulf* (*q.v.*); for there can be little doubt that this poem gained nothing and lost much in the process of literary redaction.

The conversion of the people to Christianity necessarily involved the decline of the minstrelsy that celebrated the glories of heathen times. Yet the descendants of Woden, even when they were devout Christians, would not easily lose all interest in the achievements of their kindred of former days. Chaucer's knowledge of "the song of Wade" is one proof among others that even so late as the 14th century the deeds of pagan heroes had not ceased to be recited in minstrel verse. The paucity of the extant remains of Old English heroic poetry is no argument to the contrary. The wonder is that any of it has survived at all. The clergy, to whom we owe the writing and the preservation of the Old English mss., would only in rare instances be keenly interested in secular poetry. We possess, in fact, portions of four narrative poems, treating of heroic legend—*Beowulf, Widsith, Finnesburh,* and *Waldere.* The second of these has no poetical merit, but great archaeological interest. It is an enumeration of the famous kings known to German tradition, put into the mouth of a minstrel, Widsith (the "far-travelled"), who claims to have been at many of their courts and to have been rewarded by them for his song. The extant fragment of *Finnesburh* is a battle piece, belonging to a story of which another part is introduced episodically in *Beowulf*. *Waldere,* of which we have two fragments, is concerned with Frankish and Burgundian traditions based on events of the 5th century; the hero is the "Waltharius" of Ekkehart's Latin epic. The English poem may possibly be rather a literary composition than a genuine example of minstrel poetry, but the portions that have survived are hardly inferior to the best passages of *Beowulf.*

It may be assumed that the minstrels who entertained the English kings and nobles with the recital of these heroic traditions would also celebrate the martial deeds of their patrons and ancestors. There may have existed an abundance of poetry commemorative of events in the conquest of Britain and the struggle with the Danes. Two examples only have survived, both belonging to the 10th century: *the Battle of Brunanburh,* and the *Battle of Maldon,* a work of greater merit but only a fragment.

The rapidity and thoroughness of the adoption of Christian civilization had an immediate effect. Augustine had landed in 597, and 40 years later was born an Englishman, Aldhelm, who in the judgment of contemporary Europe was the most accomplished scholar and the finest Latin writer of his time. In the next generation England produced in Bede (Baeda) a man who in solidity and variety of knowledge, and in literary power, had for centuries no rival. Aldhelm and Bede are known to us only from their Latin writings, though the former is recorded to have written vernacular poetry. The extant Old English literature is almost entirely Christian, for the poems that belong to an earlier period have been expurgated and given a Christian tone. English heathenism perished without leaving a record.

English Religious Poetry.—The Old English religious poetry was written, probably without exception, in the cloister, and by men who were familiar with the Bible and with Latin devotional literature. With the exception of the *Dream of the Rood,* it gives little evidence of poetic genius. Its material and thought are mainly derived from Latin sources; its expression is imitated from the native heroic poetry. Considering that a great deal of Latin verse was written by Englishmen in the 7th and succeeding centuries, and that in one or two poems the line is actually composed of an English and a Latin hemistich rhyming together, it seems strange that the Latin influence on Old English versification should have been so small. The alliterative long line is throughout the only metre employed, and although the laws of alliteration and rhythm were less rigorously obeyed in the later than in the earlier poetry, there is no trace of approximation to the structure of Latin verse. It is true that, owing to imitation of the Latin hymns of the church, rhyme came gradually to be more and more frequently used as an ornament of Old English verse; but it remained an ornament only, and never became an essential feature. It was not only in metrical respects but in imagery and diction that the Old English religious poetry remained faithful to its native models. Nearly all the religious poetry of any value seems to have been written in Northumbria during the 8th century. The vigorous poem of *Judith,* however, is certainly much later; and the *Exodus,* though early, seems to be of southern origin. For a detailed account of the Old English sacred poetry, the reader is referred to the articles on CAEDMON and CYNEWULF. The Riddles of the Exeter Book (*q.v.*) resemble the religious poetry in being the work of scholars, but they bear a deeper impress of the native English character.

The most original portion of the Old English literary poetry is the group of dramatic monologues—*The Banished Wife's Complaint, The Husband's Message, The Wanderer, The Seafarer, Deor* and *Wulf and Eadwacer.* The date of these is uncertain, though it cannot be later than the 10th century. That they are all of one period is unlikely, but they are all marked by the same peculiar pathos. It is not improbable that most of these poems relate to incidents of heroic legend, but this can be definitely affirmed only in the case of two short pieces, *Deor* and *Wulf and Eadwacer,* which have something of a lyric character, and are the only examples in Old English of strophic structure and the use of the refrain. *Wulf and Eadwacer* exhibits a further development in the same direction, the monotony of the long line metre being varied by the admission of short lines formed by the suppression of the second hemistich.

The Beginnings of Prose.—English prose may be said to have had its effective beginning in the reign of Alfred. It is true that vernacular prose of some kind was written much earlier. The English laws of Aethelberht of Kent, though it is perhaps unlikely that they were written down, as is commonly supposed, in the lifetime of Augustine (died A.D. 604), or even in that of the king (d. 616), were well known to Bede; and even in the 12th-century transcript their crude and elliptical style gives evidence of high antiquity. The early part of the Anglo-Saxon Chronicle (*q.v.*) is probably founded partly on prose annals of pre-Alfredian date. But although the amount of English prose written between the beginning of the 7th and the middle of the 9th century may have been considerable, Latin continued to be regarded as the appropriate vehicle for works of any literary pretension.

Of the works translated by Alfred and the scholars whom he employed, *St. Gregory's Pastoral Care* and his *Dialogues* are addressed to the priesthood; the other translations are all (not excepting the secular *History of Orosius*) essentially religious in purpose and spirit. In the preface to the *Pastoral Care,* in the accounts of Northern lands and peoples inserted in the *Orosius,* and in the free rendering of the *Consolation* of Boethius and of the *Soliloquies* of Augustine, Alfred appears as an original writer. Other fruits of his activity are his Laws and the beginnings of the Anglo-Saxon Chronicle. The Old English prose after Alfred is entirely of clerical authorship. Apart from the Chronicle, the bulk of this literature consists of translations from Latin and of homilies and saints' lives, the substance of which is derived from sources mostly accessible to us in their original form; it has therefore for us little importance except from the philological point of view. This remark may be applied, in the main, even to the writings of Aelfric, notwithstanding the interest which attaches to his achievement in the development of the capacities of the language for literary expression. The translation of the gospels, though executed in Aelfric's time (*c.* 1000), is by other

hands. The sermons of his younger contemporary, Archbishop Wulfstan, are marked by eloquence, and contain passages of historical value.

From the early years of the 11th century we possess an encyclopaedic manual of the science of the time—chronology, astronomy, arithmetic, metre, rhetoric and ethics—by the monk Byrhtferth, a pupil of Abbo of Fleury. The numerous works on medicine, the properties of herbs, and the like, are in the main selections from Latin treatises. Two famous works of fiction, the romance of *Apollonius of Tyre* and the *Letter of Alexander,* which in their Latin form had much influence on the later literature of Europe, were Englished in the 11th century. To the same period belongs the curious tract on *The Wonders of the East.*

French Influence.—The crowding of the monasteries by foreigners, after the Norman Conquest, arrested the development of the vernacular literature. It was not long before the boys in the monastic schools ceased to learn to read and write their native tongue, and learned instead to read and write French. The effects of this change are visible in the rapid alteration of the literary language. The artificial tradition of grammatical correctness lost its hold; the archaic vocabulary fell into disuse; and those who wrote English at all wrote as they spoke, using more and more an extemporized phonetic spelling based largely on French analogies. The 12th century is a brilliant period in the history of Anglo-Latin literature, and many works of merit were written in French (*see* ANGLO-NORMAN LITERATURE); but vernacular literature is scanty and of little originality. The *Peterborough Chronicle,* it is true, was continued till 1154, and its later parts contain admirable writing. But it is substantially correct to say that from this point until the age of Chaucer vernacular prose served no other purpose than that of popular religious edification. At the beginning of the 13th century the *Ancren Riwle* (*q.v.*), a book of counsel for nuns, shows literary genius, but the author's culture was French rather than English. In the early 14th century the writings of Richard Rolle and his school attained great popularity and exercised great influence on later religious thought, and in the development of prose style. The interest of *The Ayenbite of Inwyt* (*see* MICHEL OF NORTHGATE, DAN), an unintelligent translation (finished in 1340) from Frère Lorens's *Somme des vices et des vertus,* is exclusively philological.

This break in the continuity of literary tradition was no less complete in poetry. The verse from the latter part of the 12th century was uninfluenced by the work of Old English poets, whose diction had become unintelligible. There is no ground, however, to suppose that the succession of popular singers and reciters was interrupted. In the north-west the old recitative metre seems to have survived in oral tradition, with little more alteration than was rendered necessary by the changes in the language, until the middle of the 14th century, when it was again adopted by literary versifiers. The influence of native popular poetic tradition is clearly discernible in the earliest Middle English poems; but the authors of these poems were familiar with Latin, and probably spoke French as easily as their mother tongue. The artless verses of the hermit Godric, who died in 1170, exhibit in their metre the combined influence of native rhythm and of that of Latin hymnology. The *Proverbs of Alfred,* written about 1200, is (like the later *Proverbs of Hendyng*) a gnomic poem of the old Germanic type, and its rhythm is mainly of native origin. On the other hand, the meditation known as the *Moral Ode,* somewhat earlier in date, is in a metre derived from contemporary Latin verse. In the *Ormulum* (*see* ORM) this metre known as the septenarius appears without rhyme, and with a syllabic regularity previously without example in English verse. In the poetry of the 13th century the influence of French models is conspicuous. The many devotional lyrics, such as the *Luve Ron* of Thomas of Hales, show this influence both in their metrical form and in their mystical tenderness and fervour. The *Story of Genesis and Exodus,* of small poetic merit, derives its metre chiefly from French. In the sprightly dialogue of the *Owl and Nightingale,* about 1230, we have a "contention" of the type familiar in French and Provençal literature. The "Gallic" humour may be seen in various other writings of this period, notably in the *Land of Cockaigne,* a satire on monastic self-indulgence, and in the fabliau of *Dame Siriz,* a story of Eastern origin, told with almost Chaucerian skill. Predominantly French in metrical structure are the love poems collected in ms. Harl. 2253, written about 1320 in Herefordshire, some of which find a place in modern anthologies. It is noteworthy that they are accompanied by French lyrics very similar in style. The same ms. contains, besides some religious poetry, a number of political songs of the time of Edward II. Later, the victories of Edward III. down to the taking of Guisnes in 1352 were celebrated by the Yorkshireman Laurence Minot in alliterative verse with strophic arrangement and rhyme.

Metrical Chronicles.—At the beginning of the 13th century a new species of composition, the metrical chronicle, appears. The work of Layamon, a history (partly legendary) of Britain from the time of the mythical Brutus till after the mission of Augustine, is a free rendering of the Norman-French *Brut* of Wace, with additions from traditional sources. Echoes of its diction appear in the chronicle ascribed to Robert of Gloucester, written about 1300. This work, founded in its earlier part on the Latin historians of the 12th century, is an independent historical source for events of the writer's time. The succession of versified histories was continued by Thomas Bek of Castleford and by Robert Mannyng of Brunne. Mannyng's chronicle, finished in 1338, is a translation, in its earlier part from Wace's *Brut,* and in its later part from an Anglo-French chronicle written by Peter Langtoft.

Not far from the year 1300 (for the most part probably earlier rather than later) a vast mass of hagiological and homiletic verse was produced. To Gloucester belongs a series of Lives of Saints, metrically and linguistically resembling Robert of Gloucester's Chronicle. A similar collection was written in the north of England, as well as a large body of homilies, abounding in *exempla* or illustrative stories. The great rhyming chronicle of Scripture history entitled *Cursor Mundi* (*q.v.*) was written in the north about this time. The remaining homiletic verse of this period is too abundant to be referred to in detail; it will be enough to mention the sermons of William of Shoreham, written in strophic form. To the next generation belongs the *Pricke of Conscience* by Richard Rolle, the influence of which was not less powerful than that of the author's prose writings.

Romances, Native and Imported.—Romantic poetry did not assume a vernacular form till about 1250. In the next 100 years its development was rapid. Of the mass of metrical romances produced during this period no detailed account need here be attempted (*see* ROMANCE; ARTHURIAN LEGEND). Native English traditions form the basis of *King Horn, Guy of Warwick, Bevis of Hampton* and *Havelok,* though the stories were first put into literary form by Anglo-Norman poets. The popularity of these tales (with which may be classed the wildly fictitious *Coeur de Lion*) was soon rivalled by that of importations from France. The English rendering of *Floris and Blanchefleur* (a love-romance of Greek origin) is found in the same ms. that contains the earliest copy of *King Horn.* Before the end of the century, the French "matter of Britain" was represented by the Southern *Arthur and Merlin* and the Northern *Tristram* and *Yvaine and Gawin,* and the "matter of France" by *Roland and Vernagu* and *Otuel;* the *Alexander* was also translated, but in this instance the immediate original was Anglo-French. The Auchinleck ms., written about 1330, contains no fewer than 14 poetical romances; and there were many others in circulation. About the middle of the 14th century, the Old English alliterative long line, which for centuries had been used only in unwritten minstrel poetry, reappears. In one of the earliest poems in this revived measure, *Wynnere and Wastour* (1352); the author complains that original minstrel poetry no longer finds a welcome in the halls of great nobles, who prefer to listen to those who recite verses not of their own making. About the same date the metre began to be employed by men of letters for the translation of romance—*William of Palerne* and *Joseph of Arimathea* from the French, *Alexander* from Latin prose. The later development of alliterative poetry belongs to the age of Chaucer.

The extent and character of the literature produced during the first half of the 14th century indicate that the literary use of the native tongue was no longer a condescension to the needs of the common people. The rapid disuse of French as the medium of intercourse and the consequent substitution of English for French for school instruction, created a demand for vernacular reading. Though the literature which arose in answer to this demand consisted mainly of translations or adaptations of foreign works, it prepared the way for verse in which the genuine thought and feeling of the nation were to find expression.

II. CHAUCER TO THE RENAISSANCE

The age of Chaucer is of peculiar interest to the student of literature, not only because of its brilliance and productiveness but also because of its apparent promise for the future. In this, as in other aspects, Chaucer (*c.* 1340–1400) is its most notable literary figure. Beginning as a student and imitator of the best French poetry of his day, he was for a time, like most of his French contemporaries, little more than a skilful maker of elegant verses. Even at this time, to be sure, he was not without close and loving observation of the living creatures of the real world, and his verses often bring us flowers dewy and fragrant and fresh of colour as they grew in the fields and gardens about London, and birds that had learned their music in the woods; but his poetry was still not easily distinguishable from that of the "courtly makers" of France. While he was still striving to master the technique of this pretty art of trifling, he became acquainted with the new poetry of Italy. It is true that much of this new poetry moved, like that of France, among the artificialities of an unreal world of romance, but it was of wider range, of fuller tone, of far greater emotional intensity, and, at its best, was the fabric, not of elegant ingenuity, but of creative human passion,—in Dante, indeed, a wonderful visionary structure in which love and hate, and pity and terror, and the forms and countenances of men were more vivid and real than in the world of real men and real passions. Less powerful and intense than the work of Dante, but more suggestive of new methods of description, narration and characterization were the choral poems of Boccaccio, whose *La Teseide* and *Il Filostrato* not only furnished to Chaucer the materials for a new type of romance, but effected an entire transformation of his aims and artistic technique.

The Progress of Chaucer.—This transformation was effected not so much through the mere superiority of the Italian models to the French as through the stimulus which the differences between the two gave to his reflections upon the processes and technique of composition, for Chaucer was not a careless, happy-go-lucky poet of divine endowment, but a conscious, reflective artist, seeking not merely for fine words and fine sentiments, but for the proper arrangement of events, the significant exponent of character, the right tone, and even the appropriate background and atmosphere—as may be seen, for example, in the transfigurations he wrought in the *Pardoner's Tale*. It is therefore in the latest and most original of the *Canterbury Tales* that his art is most admirable, most distinguished by technical excellences. In these we find so many admirable qualities that we almost forget that he had any defects. His diction is a model of picturesqueness, of simplicity, of dignity and of perfect adaptation to his theme: his versification is not only correct but musical and varied, and shows a progressive tendency towards freer and more complex melodies; his best tales are not mere repetitions of the ancient stories they retell, but new creations, transformed by his own imaginative realization of them, full of figures having the dimensions and the vivacity of real life, acting on adequate motives, and moving in an atmosphere and against a background appropriate to their characters and their actions. In the tales of the Pardoner, the Franklin, the Summoner, the Squire, he is no less notable as a consummate artist than as a poet.

Chaucer, however, was not the only writer of his day remarkable for mastery of technique. Gower, indeed, though a man of much learning and intelligence, was neither a poet of the first rank nor an artist. Despite the admirable qualities of clearness, order and occasional picturesqueness which distinguish his work, he lacked the ability which great poets have of making their words mean more than they say, and of stirring the emotions even beyond the bounds of this enhanced meaning; and there is not, perhaps, in all his voluminous work in English, French and Latin, any indication that he regarded composition as an art requiring consideration or any care beyond that of conforming to the chosen rhythm and finding suitable rhymes.

Other Poets of Genius.—There were others more richly endowed as poets and more finely developed as artists. There was the beginner of the *Piers Plowman* cycle, the author of the Prologue and first eight passus of the A-text, a man of clear and profound observation, a poet whose imagination brought before him with distinctness and reality visual images of the motley individuals and masses of men of whom he wrote, an artist who knew how to organize and direct the figures of his dream-world, the movement of his ever-unfolding vision. There was the remarkable successor of this man, the author of the B-text, an almost prophetic figure, a great poetic idealist, and, helpless though he often was in the direction of his thought, an absolute master of images and words that seize upon the heart and haunt the memory. Besides these, an unknown writer in the west midlands had, in *Gawayne and the Grene Knight*, transformed the mediaeval romance into a thing of speed and colour, of vitality and mystery, no less remarkable for its fluent definiteness of form than for the delights of hall-feast and hunt, the graceful comedy of temptation, and the lonely ride of the doomed Gawayne through the silence of the forest and the deep snow. In the same region, by its author's power of visual imagination, the Biblical paraphrase, so often a mere humdrum narrative, had been transformed, in *Patience*, into a narrative so detailed and vivid that the reader is almost ready to believe that the author himself, rather than Jonah, went down into the sea in the belly of the great fish. And there also, by some strange chance, blossomed, with perhaps only a local and temporary fragrance until its rediscovery in the 19th century, that delicate flower of mystical aspiration, *Pearl*, a wonder of elaborate art as well as of touching sentiment.

All these writings are great, not only relatively, but absolutely. There is not one of them which would not, if written in our own time, immediately mark its author as a man of very unusual ability. But the point of special concern to us at the present moment is not so much that they show remarkable poetic power, as that they possess technical merits of a very high order. And we are accustomed to believe that, although genius is a purely personal and incommunicable element, technical gains are a common possession; that after Marlowe had developed the technique of blank verse, this technique was available for all; that after Pope had mastered the heroic couplet and Gray the ode, and Poe the short story, all men could write couplets and odes and short stories of technical correctness; that, as Tennyson puts it,

"All can grow the flower now,
For all have got the seed."

But this was singularly untrue of the technical gains made by Chaucer and his great contemporaries. *Pearl* and *Patience* were apparently unknown to the 15th century, but *Gawayne* and *Piers Plowman* and Chaucer's works were known and were influential in one way or another throughout the century. *Gawayne* called into existence a large number of romances dealing with the same hero or with somewhat similar situations, some of them written in verse suggested by the remarkable verse of their model, but the resemblance, even in versification, is only superficial. *Piers Plowman* gave rise to satirical allegories written in the alliterative long line and furnished the figures and the machinery for many satires in other metres, but the technical excellence of the first

Piers Plowman poem was soon buried for centuries under the tremendous social significance of itself and its successors. And Chaucer, in spite of the fact that he was praised and imitated by many writers and definitely claimed as master by more than one, not only transmitted to them scarcely any of the technical conquests he had made, but seems also to have been almost without success in creating any change in the taste of the public that read his poems so eagerly, any demand for better literature than had been written by his predecessors.

Lydgate, Hoccleve and Hawes.—Wide and lasting Chaucer's influence undoubtedly was. Not only was all the poetry of writers who pretended to cultivation and refinement, throughout the century, in England and Scotland, either directly or indirectly imitative of his work, but even the humblest productions of unpretentious writers show at times traces of his influence. Scotland was fortunate in having writers of greater ability than England had (*see* SCOTLAND: *Literature*). In England the three chief followers of Chaucer known to us by name are Lydgate, Hoccleve (*see* OCCLEVE) and Hawes. Because of their praise of Chaucer and their supposed personal relations to him, Lydgate and Hoccleve are almost inseparable in modern discussions, but 15th century readers and writers appear not to have associated them very closely. Hoccleve was not as prolific as Lydgate, but it is difficult to understand why his work, which compares favourably in quality with Lydgate's, attracted so much less attention. The title of his greatest poem, *De regimine principum,* may have repelled readers who were not princely born, though they would have found the work full of the moral and prudential maxims and illustrative anecdotes so dear to them; but his attack upon Sir John Oldcastle as a heretic ought to have been decidedly to the taste of the orthodox upper classes, while his lamentations over his misspent youth, his tales and some of his minor poems might have interested any one. Of a less vigorous spirit than Lydgate, he was, in his mild way, more humorous and more original. Also despite his sense of personal loss in Chaucer's death and his care to transmit to posterity the likeness of his beloved master, he seems to have been less slavish than Lydgate in imitating him. His memory is full of Chaucer's phrases, he writes in verse-forms hallowed by the master's use, and he tries to give to his lines the movement of Chaucer's decasyllables, but he is comparatively free from the influence of those early allegorical works of the master which produced the dreary imitations of the 15th century.

Lydgate's productivity was enormous—how great no man can say, for, as was the case with Chaucer also, his fame caused many masterless poems to be ascribed to him, but, after making all necessary deductions, the amount of verse that has come down to us from him is astonishing. Here it may suffice to say that his translations are predominantly epic (140,000 lines), and his original compositions predominantly allegorical love poems or didactic poems. If there is anything duller than a dull epic it is a dull allegory, and Lydgate has achieved both. This is not to deny the existence of good passages in his epics and ingenuity in his allegories, but there is no pervading, persistent life in either. His epics, like almost all the narrative verse of the time, whether epic, legend, versified chronicle or metrical romance, seem designed merely to satisfy the desire of 15th century readers for information, the craving for facts—true or fictitious—the same craving that made possible the poems on alchemy, on hunting, on manners and morals, on the duties of parish priests, on the seven liberal arts. His allegories, like most allegories of the age, are ingenious rearrangements of old figures and old machinery; they are full of what had once been imagination but had become merely memory assisted by cleverness. The great fault of all his work, as of nearly all the literature of the age, is that it is merely a more or less skilful manipulation of what the author had somewhere read or heard, and not a faithful transcript of the author's own peculiar sense or conception of what he had seen or heard or read. Style, to be sure, was a thing that Lydgate and his fellows tried to supply, and some of them supplied it abundantly according to their lights. But style meant to them external decoration, classical allusions, personifications, an inverted or even dislocated order of words, and "ornate diction."

Stephen Hawes, with his allegorical treatise on the seven liberal sciences, came later than these men, only to write worse. He was a disciple of Lydgate rather than of Chaucer, and is not only lacking in the vigour and sensitiveness which Lydgate sometimes displays, but exaggerates the defects of his master. If it be a merit to have conceived the pursuit of knowledge under the form of the efforts of a knight to win the hand of his lady, it is almost the sole merit to which Hawes can lay claim. Two or three good situations, an episode of low comedy, and the epitaph of the Knight with its famous final couplet, exhaust the list of his credits. The efforts that have been made to trace through Hawes the line of Spenser's spiritual ancestry seem not well advised.

The Failure of Chaucer's Imitators.—It is obvious that the fundamental lack of all these men was imaginative power, poetic ability. But even recognizing that the followers of Chaucer were not men of genius, it seems strange that their imitation of Chaucer was what it was. They not only entirely failed to see what his merits as an artist were and how greatly superior his mature work is to his earlier in point of technique; they even preferred the earlier and imitated it almost exclusively. Furthermore, his mastery of verse seemed to them to consist solely in writing verses of approximately four or five stresses and arranging them in couplets or in stanzas of seven or eight lines. Their preference for the early allegorical work can be explained by their lack of taste and critical discernment and by the great vogue of allegorical writing in England and France. Men who are just beginning to think about the distinction between literature and ordinary writing usually feel that it consists in making literary expression differ as widely as possible from simple direct speech. For this reason some sort of artificial diction is developed and some artificial word order devised. Allegory is used as an elegant method of avoiding unpoetical plainness, and as an easy means of substituting logic for imagination. The failure to reproduce in some degree at least the melody and smoothness of Chaucer's decasyllabic verse, and the particular form which that failure took in Lydgate, are to be explained by the fact that Lydgate and his fellows never knew how Chaucer's verse sounded when properly read. We know that a misunderstanding of Chaucer's verse existed from the 16th century to the time of Thomas Tyrwhitt; it seems clear that it began even earlier, in Chaucer's own lifetime.

There are several poems of the 15th century which were long ascribed to Chaucer. Among them are:—the *Complaint of the Black Knight,* or *Complaint of a Lover's Life,* now known to be Lydgate's; the *Mother of God,* now ascribed to Hoccleve; the *Cuckoo and the Nightingale,* by Clanvowe; *La Belle Dame sans merci,* a translation from the French of Alain Chartier by Richard Ros; *Chaucer's Dream, or the Isle of Ladies;* the *Assembly of Ladies;* the *Flower and the Leaf;* and the *Court of Love.* The two poems of Lydgate and Hoccleve are as good as Chaucer's poorest work. The *Assembly of Ladies* and the *Flower and the Leaf* are perhaps better than the *Book of the Duchess,* but not so good as the *Parliament of Fowls.* The *Flower and the Leaf,* it will be remembered, was very dear to John Keats, who, like all his contemporaries, regarded it as Chaucer's. An additional interest attaches to both it and the *Assembly of Ladies,* from the fact that the author may have been a woman. These poems, like the *Court of Love,* are thoroughly conventional in material, all the figures and poetical machinery may be found in dozens of other poems in England and France, as Prof. Neilson has shown for the *Court of Love* and Marsh for the *Flower and the Leaf;* but there are a freshness of spirit and a love of beauty in them that are not common; the conventional birds and flowers are there, but they seem, like those of Chaucer's *Legend,* to have some touch of life, and the conventional companies of ladies and gentlemen ride and talk and walk with natural grace and ease. The *Court of Love* is usually ascribed to a very late date, as late even as the middle of the 16th century. If this is correct, it is a notable instance of the persistence of a Chaucerian influence.

Whatever may be true of the authorship of the *Assembly of Ladies* and the *Flower and the Leaf,* there were women writers in England in the middle ages. Juliana of Norwich wrote her *Revelations of Divine Love* before 1400. The much discussed

Dame Juliana Berners, the supposed compiler of the treatise on hunting in the *Book of St. Albans,* may be mythical, though there is no reason why a woman should not have written such a book; and a shadowy figure that disappears entirely in the sunlight is the supposed authoress of the *Nut Brown Maid,* for if language is capable of definite meaning, the last stanza declares unequivocally that the poem is the work of a man. But there is a poem warning young women against entering a nunnery which may be by a woman, and there is an interesting entry among the records of New Romney for 1463–64, "Paid to Agnes Forde for the play of the Interlude of our Lord's Passion, 6s. 8d.," which is apparently the earliest mention of a woman dramatist in England. Finally, Margaret, countess of Richmond, the mother of Henry VII., not only aided scholars and encouraged writers, but herself translated the (spurious) fourth book of St. Thomas à Kempis's *Imitatio Christi.* Another Margaret, the duchess of Burgundy, it will be remembered, encouraged Caxton in his translation and printing. Women seem, indeed, to have been especially lovers of books and patrons of writers, and Skelton, if we may believe his *Garland of Laurel,* was surrounded by a bevy of ladies comparable to a modern literary club.

Songs, Carols and Ballads.—The most original and powerful poetry of the 15th century was composed in popular forms for the ear of the common people and was apparently written without conscious artistic purpose. Three classes of productions deserve special attention—songs and carols, popular ballads and certain dramatic compositions. The songs and carols belong to a species which may have existed in England before the Norman Conquest, but which certainly was greatly modified by the musical and lyric forms of France. The best of them are the direct and simple if not entirely artless expressions of personal emotion, and even when they contain, as they sometimes do, the description of a person, a situation, or an event, they deal with these things so subjectively, confine themselves so closely to the rendering of the emotional effect upon the singer, that they lose none of their directness or simplicity. Some of them deal with secular subjects, some with religious, and some are curious and delightful blendings of religious worship and aspiration with earthly tenderness for the embodiments of helpless infancy and protecting motherhood which gave Christianity so much of its power over the affections and imagination of the middle ages. Even those which begin as mere expressions of joy in the Yuletide eating and drinking and merriment catch at moments hints of higher joys, of finer emotions, and lift singer and hearer above the noise and stir of earth.

The lyrics which describe a situation form a logical, if not a real transition to those which narrate an episode or an event. The most famous of the latter, the *Nut Brown Maid,* has often been called a ballad, and "lyrical ballad" it is in the sense established by Coleridge and Wordsworth, but its affinities are rather with the song or carol than with the folk-ballad, and, like Henryson's charming *Robin and Malkin,* it is certainly the work of a man of culture and of conscious artistic purpose and methods. Unaccompanied, as it is, by any other work of the same author, this poem, with its remarkable technical merits, is an even more astonishing literary phenomenon than the famous single sonnet of Blanco White.

The folk-ballad, like the song or carol, belongs in some form to immemorial antiquity. It can hardly be doubted that in some of the folk-ballads of the 15th century are preserved not only traditions of dateless antiquity, but formal elements and technical processes that actually are derived from communal song and dance. By the 15th century, however, communal habits and processes of composition had ceased, and the traditional elements, formulae and technique had become merely conventional aids and guides for the individual singer. Ancient as they were, conventional as, in a sense, they also were, they exercised none of the deadening, benumbing influence of ordinary conventions. At their best moments the best ballads have an almost incomparable power, and to a people sick, as we are, of the ordinary, the usual, the very trivialities and impertinences of the ballads only help to define and emphasize these best moments. In histories of English literature the ballads have been so commonly discussed in connection with their rediscovery in the 18th century, that we are apt to forget that some of the very best were demonstrably composed in the 15th and that many others of uncertain date probably belong to the same time.

Along with the genuine ballads dealing with a recent event or a traditional theme there were ballads in which earlier romances are retold in ballad style. This was doubtless inevitable in view of the increasing epic tendency of the ballad and the interest still felt in metrical romances, but it should not mislead us into regarding the genuine folk-ballad as an out-growth of the metrical romance.

Besides the ordinary epic or narrative ballad, the 15th century produced ballads in dramatic form, or, perhaps it were better to say, dramatized some of its epic ballads. How commonly this was done we do not know, but the scanty records of the period indicate that it was a widespread custom, though only three plays of this character (all concerning Robin Hood) have come down to us. These plays had, however, no further independent development, but merely furnished elements of incident and atmosphere to later plays of a more highly organized type. With these ballad plays may also be mentioned the Christmas plays (usually of St. George) and the sword-dance plays, which also flourished in the 15th century, but survive for us only as obscure elements in the masques and plays of Ben Jonson and in such modern rustic performances as Thomas Hardy has so charmingly described in *The Return of the Native.* For the contribution made by the 15th century to dramatic literature, the reader may be referred to the article Drama.

The Lack of Good Prose.—Not much good prose was written in the 15th century. It is doubtful if any one thought of prose as a possible medium of artistic expression. Chaucer apparently did not, in spite of the comparative excellence of his Preface to the *Astrolabe* and his occasional noteworthy successes with the difficulties of the philosophy of Boethius; Wycliffe is usually clumsy; and the translators of Mandeville, though they often give us passages of great charm, obviously were plain men who merely translated as best they could. There was, however, a comparatively large amount of prose written in the 15th century, mainly for religious or educational purposes, dealing with the same sorts of subjects that were dealt with in verse, and in some cases not distinguishable from the verse by any feature but the absence of rhyme. The vast body of this we must neglect; only five writers need be named: John Capgrave, Reginald Pecock, Sir John Fortescue, Caxton and Malory. Capgrave, the compiler of the first chronicle in English prose since the Conquest, wrote by preference in Latin; his English is a condescension to those who could not read Latin and has the qualities which belong to the talk of an earnest and sincere man of commonplace ability. Pecock and Fortescue are more important. Pecock (*c.* 1395–*c.* 1460) was a man of singularly acute and logical mind. He prided himself upon his dialectic skill and his faculty for discovering arguments that had been overlooked by others. His writings, therefore—or at least the *Repressor*—are excellent in general structure and arrangement, his ideas are presented clearly and simply, with few digressions or excrescences, and his sentences, though sometimes too long, are more like modern prose than any others before the age of Elizabeth. His style is lightened by frequent figures of speech, mostly illustrative, and really illustrative, of his ideas, while his intellectual ingenuity cannot fail to interest even those whom his prejudices and preconceptions repel. Fortescue, like Capgrave, wrote by preference in Latin, and, like Pecock, was philosophical and controversial. But his principal English work, the *Difference between an Absolute and a Limited Monarchy,* differs from Pecock's in being rather a pleading than a logical argument, and the geniality and glowing patriotism of its author give it a far greater human interest.

Caxton and Malory.—No new era in literary composition was marked by the activity of William Caxton as translator and publisher, though the printing-press has, of course, changed fundamentally the problem of the dissemination and preservation of culture, and thereby ultimately affected literary production

profoundly. But neither Caxton nor the writers whose works he printed produced anything new in form or spirit. His publications range over the whole field of 15th century literature, and no doubt he tried, as his quaint prefaces indicate, to direct the public taste to what was best among the works of the past, as when he printed and reprinted the *Canterbury Tales*, but among all his numerous publications not one is the herald of a new era. The only book of permanent interest as literature which he introduced to the world was the *Morte d'Arthur* of Sir Thomas Malory, and this is a compilation from older romances (*see* ARTHURIAN LEGEND). It is, to be sure, the one book of permanent literary significance produced in England in the 15th century; it glows with the warmth and beauty of the old knight's conception of chivalry and his love for the great deeds and great men of the visionary past, and it continually allures the reader by its fresh and vivid diction and by a syntax which, though sometimes faulty, has almost always a certain naïve charm.

Whatever may have been the effect of the wars and the growth of industrial life in England in withdrawing men of the best abilities from the pursuit of literature, neither these causes nor any other interfered with the activity of writers of lesser powers. The amount of writing is really astonishing, as is also its range. More than 300 separate works (exclusive of the large number still ascribed to Lydgate and of the 70 printed by Caxton) have been made accessible by the Early English Text Society and other public or private presses, and it seems probable that an equal number remains as yet unpublished. No list of these writings can be given here, but it may not be unprofitable to indicate the range of interests by noting the classes of writing represented. The classification is necessarily rough, as some writings belong to more than one type. We may note, first, love poems, allegorical and unallegorical, narrative, didactic, lyrical and quasi-lyrical; poems autobiographical and exculpatory; poems of eulogy and appeal for aid; tales of entertainment or instruction, in prose and in verse; histories ancient and modern, and brief accounts of recent historical events, in prose and in verse; prose romances and metrical romances; legends and lives of saints, in prose and in verse; poems and prose works of religious meditation, devotion and controversy; treatises of religious instruction, in prose and in verse; ethical and philosophical treatises, and ethical and prudential treatises; treatises of government, of political economy, of foreign travel, of hygiene, of surgery, of alchemy, of heraldry, of hunting and hawking and fishing, of farming, of good manners, and of cooking and carving. Prosaic and intended merely to serve practical uses as many of these were, verse is the medium of expression as often as prose. Besides this large amount and variety of English compositions, it must be remembered that much was also written in Latin, and that Latin and French works of this and other centuries were read by the educated classes.

Although the intellectual and spiritual movement which we call the Italian Renaissance was not unknown in England in the 14th and 15th centuries, it is not strange that it exercised no perceptible influence upon English literature, except in the case of Chaucer. Chaucer was the only English man of letters before the 16th century who knew Italian literature. The Italians who visited England and the Englishmen who visited Italy were interested, not in literature, but in scholarship. Such studies as were pursued by Free, Grey, Flemming, Tilly, Gunthorpe and others who went to Italy, made them better grammarians and rhetoricians, and no doubt gave them a freer, wider outlook, but upon their return to England they became immediately absorbed in administrative cares, which left them little leisure for literary composition, even if they had had any inclination to write. They prepared the way, however, for the leaders of the great intellectual awakening which began in England with Linacre, Colet, More and their fellows, and which finally culminated in the age of Spenser, Bacon, Shakespeare, Jonson, Gilbert, Harvey and Harriott.

When the middle ages ceased in England it is impossible to say definitely. Long after the new learning and culture of the Renaissance had been introduced there, long after classical and Italian models were eagerly chosen and followed, the epic and lyric models of the middle ages were admired and imitated, and the ancient forms of the drama lived side by side with the new until the time of Shakespeare himself. John Skelton, although according to Erasmus "unum Britannicarum literarum lumen ac decus," and although possessing great originality and vigour both in diction and in versification when attacking his enemies or indulging in playful rhyming, was not only a great admirer of Lydgate, but equalled even the worst of his predecessors in aureate pedantries of diction, in complicated impossibilities of syntax, and in meaningless inversions of word-order whenever he wished to write elegant and dignified literature. And not a little of the absurd diction of the middle of the 16th century is merely a continuation of the bad ideals and practices of the refined writers of the 15th.

In fine, the 15th century has, apart from its vigorous, though sometimes coarse, popular productions, little that can interest the lover of literature. Although, however, in the quality of its literary output it is decidedly inferior to the 14th century, the amount and the wide range of its productions indicate the gradual extension of the habit of reading to classes of society that were previously unlettered; and this was of great importance for the future of English literature, just as the innumerable dramatic performances throughout England were important in developing audiences for Marlowe and Shakespeare and Beaumont and Fletcher.

For bibliography *see* vol. ii. of the *Cambridge History of Literature* (1909); and Brandl's *Geschichte der mittelenglischen Literatur* (reprinted from Paul's *Grundriss der germanischen Philologie*). Interesting general discussions may be found in the larger histories of English Literature, such as Ten Brink's, Jusserand's, and (a little more antiquated) Courthope's and Morley's. (J. M. MA.)

III. ELIZABETHAN TIMES

General Influences, and Prologue to 1579.—The history of letters in England from More's *Utopia* (1516), the first Platonic vision, to Milton's *Samson Agonistes* (1671), the latest classic tragedy, is one and continuous. That is the period of the English Renaissance, in the wider sense, and it covers all and more of the literature loosely called "Elizabethan." With all its complexity and subdivisions, it has as real a unity as the age of Pericles, or that of Petrarch and Boccaccio, or the period in Germany that includes both Lessing and Heine. It is peculiar in length of span, in variety of power, and in wealth of production, though its master-works on the greater scale are relatively few. It is distinct, while never quite cut off, from the middle age preceding, and also from the classical or "Augustan" age that followed. The coming of Dryden denoted a new phase; but it was still a phase of the Renaissance; and the break that declared itself about 1660 counts as nothing beside the break with the middle ages; for this implied the whole change in art, thought and temper, which recreated the European mind. It is true that many filaments unite Renaissance and middle ages, not only in the religious and purely intellectual region, but in that of art. The matter of Geoffrey of Monmouth, the tales of Arthur and of Troilus, the old fairy folklore of the South, the topic of the *Falls of Princes,* lived on; and so did the characteristic mediaeval form, allegory and many of the old metres of the 14th century. But then these things were transformed, often out of knowledge. Shakespeare's use of the histories of Macbeth, Lear and Troilus, and Spenser's of the allegoric romance, are examples. And when the gifts of the middle ages are not transformed, as in the *Mirror for Magistrates,* they strike us as survivals from a lost world.

So vital a change took long in the working. The English Renaissance of letters only came into full flower during the last 20 years of the 16th century, later than in any Southern land; but it was all the richer for delay, and would have missed many a life-giving element could it have been driven forward sooner. If the actual process of genius is beyond analysis, we can still notice the subjects which genius receives, or chooses, to work upon, and also the vesture which it chooses for them; and we can watch some of the forces that long retard but in the end fertilize these workings of genius.

What, then, in England, were these forces? Two of them lie outside letters, namely, the political settlement, culminating in the

later reign of Elizabeth, and the religious settlement, whereby the Anglican Church grew out of the English Reformation. A third force lay within the sphere of the Renaissance itself, in the narrower meaning of the term. It was culture—the prefatory work of culture and education, which at once prepared and put off the flowering of pure genius. "Elizabethan" literature took its complexion from the circumstance that all these three forces were in operation at once. The Church began to be fully articulate, just when the national feeling was at its highest, and the tides of classical and immigrant culture were strongest. Spenser's *Faerie Queene*, Hooker's *Ecclesiastical Polity* and Shakespeare's *Henry V.* came in the same decade (1590–1600). But these three forces, political, religious and educational, were of very different duration and value. The enthusiasm of 1590–1600 was already dying down in the years 1600–10, when the great tragedies were written; and soon a wholly new set of political forces began to tell on art. The religious inspiration was mainly confined to certain important channels; and literature as a whole, from first to last, was far more secular than religious. But Renaissance culture, in its ramifications and consequences, tells all the time and over the whole field, from 1500 to 1660. It is this culture which really binds together the long and varied chronicle. Before passing to narrative, a short review of each of these elements is required.

Politics and Religion.—Down to 1579 the Tudor rule was hardly a direct inspiration to authors. The reign of Henry VII. was first duly told by Bacon, and that of Henry VIII. staged by Shakespeare and Fletcher, in the time of James I. Sir Thomas More found in Roper, and Wolsey in Cavendish, sound biographers, who are nearly the earliest in the language. The later years of Henry VIII. were full of episodes too tragically picturesque for safe handling in the lifetime of his children. The next two reigns were engrossed with the religious war; and the first 20 years of Elizabeth, if they laid the bases of an age of peace, well-being, and national self-confidence that was to prove a teeming soil for letters, were themselves poor in themes for patriotic art. The abortive treason of the northern earls was echoed only in a ringing ballad. But the voyagers, freebooters, and explorers reported their experiences as a duty, not for fame; and these, though not till the golden age, were edited by Hakluyt, and fledged the poetic fancies that took wing from the "Indian Peru" to the "still-vext Bermoothes." Yet, in default of any true historian, the queen's wise delays and diplomacies that upheld the English power, and her refusal to launch on a Protestant or a national war until occasion compelled and the country was ready, were subjects as uninspiring to poets as the burning questions of the royal marriage or the royal title. But by 1580 the nation was filled with the sense of Elizabeth's success and greatness and of its own prosperity. No shorter struggle and no less achievement could have nursed the insolent, jubilant patriotism of the years that followed; a feeling that for good reasons was peculiar to England among the nations, and created the peculiar forms of the chronicle play and poem. These were borrowed neither from antiquity nor from abroad, and were never afterwards revived. The same exultation found its way into the current forms of ode and pastoral, of masque and allegory, and into many a dedication and interlude of prose. It was so strong as to outlive the age that gave it warrant. The passion for England, the passion of England for herself, animates the bulk of Drayton's *Poly-Olbion*, which was finished so late as 1622. But the public issues were then changing, the temper was darker; and the civil struggle was to speak less in poetry than in the prose of political theory and ecclesiastical argument, until its after-explosion came in the verse of Milton.

The English Reformation, so long political rather than doctrinal or imaginative, cost much writing on all sides; but no book like Calvin's *Institution* is its trophy, at once defining the religious change for millions of later men and marking a term of departure in the national prose. Still, the debating weapons, the axes and billhooks, of vernacular English were sharpened—somewhat jaggedly—in the pamphlet battles that dwarfed the original energies of Sir Thomas More and evoked those of Tyndale and his friends. The powers of the same style were proved for descriptive economy by Starkey's Dialogue between Pole and Lupset, and for religious appeal by the blunt sound rhetoric and forthright jests in the sermons of Latimer (d. 1555). Foxe's reports of the martyrs are the type of early Protestant English (1563); but the reforming divines seldom became real men of letters even when their Puritanism, or discontent with the final Anglican settlement and its temper, began to announce itself. Their spirit, however, comes out in many a corner of poetry, in Gascoigne's *Steel Glass* as in Spenser's *Shepherd's Calendar;* and the English Reformation lived partly on its pre-natal memories of Langland as well as of Wycliffe. The fruit of the struggle, though retarded, was ample. Carrying on the work of Fisher and Cranmer, the new Church became the nursing mother of English prose, and trained it more than any single influence—trained it so well, for the purposes of sacred learning, translation and oratory, and also as a medium of poetic feeling, that in these activities England came to rival France. How late any religious writer of true rank arose may be seen by the lapse of over half a century between Henry VIII.'s Act of Supremacy and Hooker's treatise. But after Hooker the chain of eloquent divines was unbroken for 100 years.

Renaissance Culture had many stages and was fed from many streams. At the outset of the century, in the wake of Erasmus, under the teaching of Colet and his friends, there spread a sounder knowledge of the Greek and Latin tongues, of the classic texts, and so of the ancient life and mind. This period of humanism in the stricter sense was far less brilliant than in Italy and France. No very great scholar or savant arose in Britain for a long time; but neo-Latin literature, the satellite of scholarship, shone brightly in George Buchanan. But scholarship was created and secured; and in at least one, rather solitary, work of power, the *Utopia* (which remained in Latin till 1551), the fundamental process was begun which appropriates the Greek mind, not only for purposes of schooling, but as a source of new and independent thinking. In and after the middle of the century the classics were again put forward by Cheke, by Wilson in his *Art of Rhetoric* (1553), and by Ascham in his letters and in his *Schoolmaster* (1570), as the true staple of humane education, and the pattern for a simple yet lettered English. The literature of translations from the classics, in prose and verse, increased; and these works, at first plain, business-like, and uninspired, slowly rose in style and power, and at last, like the translations from modern tongues, were written by a series of masters of English, who thus introduced Plutarch and Tacitus to poets and historians. This labour of mediation was encouraged by the rapid expansion and reform of the two universities, of which almost every great master except Shakespeare was a member; and even Shakespeare had ample Latin for his purpose.

The direct impact of the classics on "Elizabethan" literature, whether through such translations or the originals, would take long to describe. But their indirect impact is far stronger, though in result the two are hard to discern. This is another point that distinguishes the English Renaissance from the Italian or the French, and makes it more complex. The knowledge of the thought, art and enthusiasms of Rome and Athens constantly came round through Italy or France, tinted and charged in the passage with something characteristic of those countries. The early playwrights read Seneca in Latin and English, but also the foreign Senecan tragedies. Spenser, when starting on his pastorals, studied the Sicilians, but also Sannazaro and Marot. Shakespeare saw heroic antiquity through Plutarch, but also, surely, through Montaigne's reading of antiquity. Few of the poets can have distinguished the original fountain of Plato from the canalized supply of the Italian Neoplatonists. The influence, however, of Cicero on the Anglican pulpit was immediate as well as constant; and so was that of the conciser Roman masters, Sallust and Tacitus, on Ben Jonson and on Bacon. Such scattered examples only intimate the existence of two great chapters of English literary history—the effects of the classics and the effects of Italy. The bibliography of 16th century translations from the Italian in the fields of political and moral speculation, poetry, fiction and the drama, is so large as itself to tell part of the story. The genius of Italy served the genius of England in three distinctive ways. It inspired the recovery, with new modulations, of a lost music and a

lost prosody. It modelled many of the chief poetic forms, which soon were developed out of recognition; such were tragedy, allegory, song, pastoral and sonnet. Thirdly, it disclosed some of the master-thoughts upon government and conduct formed both by the old and the new Mediterranean world. Machiavelli, the student of ancient Rome and modern Italy, riveted the creed of Bacon. It might be said that never has any modern people so influenced another in an equal space of time—and letters, here as ever, are only the voice, the symbol, of a whole life and culture—if we forgot the sway of French in the later 17th and 18th centuries. And the power of French was alive also in the 16th. The track of Marot, of Ronsard and the Pleiad and Desportes, of Rabelais and Calvin and Montaigne, is found in England. Journeymen like Boisteau and Belleforest handed on immortal tales. The influence is noteworthy of Spanish mannerists, above all of Guevara upon sententious prose, and of the novelists and humorists, headed by Cervantes, upon the drama. German legend is found not only in Marlowe's *Faustus*, but in the byways of play and story. It will be long before the rich and coloured tangle of these threads has been completely unravelled with due tact and science. The presence of one strand may here be mentioned, which appears in unexpected spots.

As in Greece, and as in the day of Coleridge and Shelley, the fabric of poetry and prose is shot through with philosophical ideas; a further distinction from other literatures like the Spanish of the golden age or the French of 1830. But these were not so much the ideas of the new physical science and of Bacon as of the ethical and metaphysical ferment. The wave of free talk in the circles of Marlowe, Greville and Raleigh ripples through their writings. Though the direct influence of Giordano Bruno on English writers is probably limited to a reminiscence in the *Faerie Queene* (Book vii.), he was well acquainted with Sidney and Greville, argued for the Copernican theory at Greville's house, lectured on the soul at Oxford, and published his epoch-marking Italian dialogues during his two years' stay (1583–85) in London. The debates in the earlier schools of Italy on the nature and tenure of the soul are heard in the *Nosce Teipsum* (1599) of Sir John Davies; a stoicism, "of the schools" as well as "of the blood," animates Cassius and also the French heroes of Chapman; and if the earlier drama is sown with Seneca's old maxims on sin and destiny, the later drama, at least in Shakespeare, is penetrated with the freer reading of life and conduct suggested by Montaigne. Platonism—with its *vox angelica* sometimes a little hoarse—is present from the youthful *Hymns* of Spenser to the last followers of Donne; sometimes drawn from Plato, it is oftener the Christianized doctrine codified by Ficino or Pico. It must be noted that this play of philosophic thought only becomes marked after 1580, when the preparatory tunings of English literature are over.

The period down to 1580 in the departments of prose, verse and drama was a time which left few memorials of form.

Prose to 1580.—Early modern English prose, as a medium of art, was of slow growth. For long there was alternate strife and union (ending in marriage) between the Latin, or more rhetorical, and the ancestral elements of the language, and this was true both of diction and of construction. We need to begin with the talk of actual life, as we find it in the hands of the more naïf writers, in its idiom and gusto and unshapen power, to see how style gradually declared itself. In State letters and reports, in the recorded words of Elizabeth and Mary of Scotland and public men, in travels and memoirs, in Latimer, in the rude early versions of Cicero and Boëthius, in the more unstudied speech of Ascham or Leland, the material lies. At the other extreme there are the English liturgy (1549, 1552, 1559, with the final fusion of Anglican and Puritan eloquence), and the sermons of Fisher and Cranmer,—nearly the first examples of a sinuous, musical and Ciceronian cadence. A noble pattern for saga-narrative and lyrical prose was achieved in the successive versions (1526–40–68) of the Hebrew and Greek Scriptures, where a native simple diction of short and melodious clauses are prescribed by the matter itself. Prose, in fact, down to Shakespeare's time, was largely the work of the churchmen and translators, aided by the chroniclers. About the mid-century the stories, as well as the books of conduct and maxim, drawn from Italy and France, begin to thicken. Perverted symmetry of style is found in euphuistic hacks like Pettie. Painter's *Palace of Pleasure* (1566) provided the plots of Bandello and others for the dramatists. Hoby's version (1561) of Castiglione's *Courtier*, with its command of elate and subtle English, is the most notable imported book between Berners's *Froissart* (1523–25) and North's *Plutarch* (1579). Ascham's *Schoolmaster* is the most typical English book of Renaissance culture, in its narrower sense, since *Utopia*. Holinshed's *Chronicle* (1577–87) and the work of Halle, if pre-critical, were all the fitter to minister to Shakespeare.

Verse to 1580.—The lyric impulse was fledged anew at the court of Henry VIII. The short lines and harping burdens of Sir Thomas Wyatt's songs show the revival, not only of a love-poetry more plangent than anything in English since Chaucer, but also of the long-deadened sense of metre. In Wyatt's sonnets, octaves, terzines and other Italian measures, we can watch the painful triumphant struggles of this noble old master out of the slough of formlessness in which verse had been left stranded. Wyatt's primary deed was his gradual rediscovery of the iambic decasyllabic line duly accented—the line that had been first discovered by Chaucer for England; and next came its building into sonnet and stanza. Wyatt (d. 1542) ended with perfect formal accuracy; he has the honours of victory; and Henry Howard, earl of Surrey (d. 1547), a young-hearted and more gracious but a lighter poet, carried on his labour, and caught some of Chaucer's as well as the Italian tunes. The blank verse of his two translated *Aeneids*, like all that written previous to Peele, gave little inkling of the latencies of the measure which was to become the cardinal one of English poetry. It was already the vogue in Italy for translations from the classics; and we may think of Surrey importing it like an uncut jewel and barely conscious of its value. His original poems, like those of Wyatt, waited for print till the eve of Elizabeth's reign, when they appeared, with those of followers like Grimald, in Tottel's *Miscellany* (1557), the first of many such garlands, and the outward proof of the poetical revival dating 20 years earlier. But this was a false dawn. Only one poem of authentic power, Sackville's *Induction* (1563) to that dreary patriotic venture, *A Mirror for Magistrates*, was published for 20 years. In spirit mediaeval, this picture of the gates of hell and of the kings in Bale achieves a new melody and a new intensity, and makes the coming of Spenser far less incredible. But poetry was long starved by the very ideal that nursed it—that of the all-sided, all-accomplished "courtier" or cavalier, to whom verse-making was but one of all the accomplishments that he must perfect, like fencing, or courting, or equestrian skill. Wyatt and Surrey, Sackville and Sidney (and we may add Hamlet, a true Elizabethan) are of this type. One of the first competent professional writers was George Gascoigne, whose remarks on metric, and whose blank verse satire, *The Steel Glass* (1576), save the years between Sackville and Spenser. Otherwise the gap is filled by painful rhymesters with rare flashes, such as Googe, Churchyard and Turberville.

Drama to 1580.—The English Renaissance drama, both comic and tragic, illustrates on the largest scale the characteristic power of the antique at this period—at first to reproduce itself in imitation, and then to generate something utterly different from itself, something that throws the antique to the winds. Out of the Morality, a sermon upon the certainty of death or the temptations of the soul, acted by personified qualities and supernatural creatures, had grown up, in the reign of Henry VII., the Interlude, a dialogue spoken by representative types or trades, who faintly recalled those in Chaucer's *Prologue*. These forms, which may be termed mediaeval, continued long and blended; sometimes heated, as in *Respublica*, with doctrine, and usually lightened by the comic play of a "Vice" or incarnation of sinister roguery. John Heywood was the chief maker of the pure interludes, and Bishop Bale of the Protestant medleys; his *King Johan*, a reformer's partisan tract in verse, contains the germs of the chronicle play. In the drama down to 1580 the native talent is sparse enough, but the historical interest is high. Out of a seeming welter of forms, the structure, the metres and the species that Kyd and Marlowe

found slowly emerged. Comedy was first delivered from the interlude, and fashioned in essence as we know it, by the schoolmasters. Drawing on Plautus, they constructed duly-knitted plots, divided into acts and scenes and full of homely native fun, for their pupils to present. In *Thersites* (written 1537), the oldest of these pieces, and in Udall's *Ralph Roister Doister* (1552 at latest), the best known of them, the characters are lively, and indeed are almost individuals. In others, like *Misogonus* (written 1560), the abstract element and improving purpose remain, and the source is partly neo-Latin comedy, native or foreign. Romance crept in: serious comedy, with its brilliant future, the comedy of high sentiment and averted dangers mingled still with farce, was shadowed forth in *Damon and Pithias* and in the curious play *Common Conditions;* while the domestic comedy of intrigue dawned in Gascoigne's *Supposes,* adapted from Ariosto. Thus were displaced the ranker rustic fun of *Gammer Gurton's Needle* (written *c.* 1559) and other labours of "rhyming motherwits." But there was no style, no talk, no satisfactory metre. The verse of comedy waited for Greene, and its prose for Lyly. Structure, without style, was also the main achievement of the early tragedies. The Latin plays of Buchanan, sometimes biblical in topic, rest, as to their form, upon Euripides. But early English tragedy was shapen after the Senecan plays of Italy and after Seneca himself, all of whose dramas were translated by 1581. *Gorboduc, or Ferrex and Porrex,* acted about 1561, and written by Sackville and Norton, and Hughes' *Misfortunes of Arthur* (acted 1588), are not so much plays as wraiths of plays, with their chain of slaughters and revenges, their two-dimensional personages, and their lifeless maxims which fail to sweeten the bloodshot atmosphere. The Senecan form was not barren in itself, as its sequel in France was to show: it was only barren for England. After Marlowe it was driven to the study, and was still written (possibly under the impulse of Mary countess of Pembroke) by Daniel and Greville, with much reminiscence of the French Senecans. But it left its trail on the real drama. It set the pattern of a high tragical action, often motived by revenge, swayed by large ideas of fate and retribution, and told in blank metre; and it bequeathed, besides many moral sentences, such minor points of mechanism as the Ghost, the Chorus and the inserted play. There were many hybrid forms like *Gismond of Salern,* based on foreign story, alloyed with the mere personifications of the Morality, and yet contriving, as in the case of *Promos and Cassandra* (the foundation of *Measure for Measure*), to interest Shakespeare. Thus the drama by 1580 had some of its carpentry, though not yet a true style or versification. These were only to be won by escape from the classic tutelage. The ruder chronicle play also began, and the reigns of John and Henry V. amongst others were put upon the stage.

Verse from Spenser to Donne.—Sir Philip Sidney almost shares with Edmund Spenser the honours of announcing the new verse, for part of his *Astrophel and Stella* was written, if not known in unpublished form, about 1580–81, and contains ten times the passion and poetry of *The Shepherd's Calendar* (1579). This work, of which only a few passages have the seal of Spenser's coming power, was justly acclaimed for its novelty of experiment in many styles, pastoral, satiric and triumphal, and in many measures: though it was criticized for its "rustic" and archaic diction—a "no language" that was to have more influence upon poetry than any of the real dialects of England. Spenser's desire to write high tragedy, avowed in his *October,* was not to be granted; his nine comedies are lost; and he became the chief non-dramatic poet of his time in England. Both the plaintive pessimism of Petrarch and du Bellay, with their favourite method of emblem, and the Platonic theory of the spiritual love and its heavenly begetting sank into him; and the *Hymns To Love* and *To Beauty* are possibly his earliest verses of sustained perfection and exaltation. These two strains of feeling Spenser never lost and never harmonized; the first of them recurs in his *Complaints* of 1591, above all in *The Ruins of Time,* the second in his *Amoretti* (1595) and *Colin Clout* and *Epithalamion,* which are autobiographical. These and a hundred other threads are woven into *The Faerie Queene,* an unfinished allegorical epic in honour of moral goodness, of which three books came out in 1590 and three more in 1596, while the fragment *Of Constancy* (so-called) is first found in the posthumous folio of 1609. This poem is the fullest reflex, outside the drama, of the soul and aspirations of the time. For its scenery and mechanism the *Orlando Furioso* of Ariosto furnishes the framework. In both poems tales of knightly adventure intertwine unconfused; in both the slaying of monsters, the capture of strong places, and the release of the innocent, hindered by wizard and sorcerer, or aided by magic sword and horn and mirror, constitute the quest; and in both warriors, ladies, dwarfs, dragons and figures from old mythology jostle dreamily together. To all this pomp Spenser strove to give a moral and often also a political meaning. Ariosto was not a *vates sacer;* and so Spenser took Tasso's theme of the holy war waged for the Sepulchre, and expanded it into a war between good and evil, as he saw them in the world; between chastity and lust, loyalty and detraction, England and Spain, England and Rome, Elizabeth and usurpers, Irish governor and Irish rebel, right and wrong. The title-virtues of his six extant books he affects to take from Aristotle; but Holiness, Temperance, Chastity, Justice, Friendship and Courtesy form a medley of mediaeval, puritanical and Greek ideals.

Spenser's moral sentiments, often ethereally noble, might well be contrasted, and that not always to their credit, with those more secular and naturalistic ones that rule in Shakespeare or in Bernardino Telesio and Giordano Bruno. But *The Faerie Queene* lives by its poetry; and its poetry lives independently of its creed. The idealized figures of Elizabeth, who is the Faerie Queene, and of the "magnificent" Prince Arthur, fail to bind the adventures together, and after two books the poem breaks down in structure. And indeed all through it relies on episode and pageant, on its prevailing and insuppressible loveliness of scene and tint, of phrasing and of melody, beside which the inner meaning is often an interruption. Spenser is not to be tired; in and out of his tapestry, with its "glooming light much like a shade," pace his figures on horseback, or in durance, with their clear and pictorial allegoric trappings; and they go either singly, or in his favourite masques or pageants, suggested by emblematical painting or civic procession. He is often duly praised for his lingering and liquid melodies and his gracious images, or blamed for their languor; but his ground-tone is a sombre melancholy—unlike that of Jaques—and his deepest quality as a writer is perhaps his angry power. Few of his 40,000 and more lines are unpoetical; in certainty of style, amongst English poets who have written profusely, he has no equals but Chaucer, Milton and Shelley. His "artificial" diction, drawn from middle English, from dialect or from false analogy, has always the intention and nearly always the effect of beauty; we soon feel that its absence would be unnatural, and it has taken its rank among the habitual and exquisite implements of English poetry. This equality of noble form is Spenser's strength, as dilution and diffusion of phrase, and a certain monotonous slowness of *tempo,* are beyond doubt his weaknesses. His chief technical invention, the nine-line stanza (*ababbcbcc*) was developed not from the Italian octave (*abababcc*), but by adding an alexandrine to the eight-line stave (*ababbcbc*) of Chaucer's *Monk's Tale.* It is naturally articulated twice—at the fifth line, where the turn of repeated rhyme inevitably charms, and at the ninth, which runs now to a crashing climax, now to a pensive and sighing close. In rhyming, Spenser, if not always accurate, is one of the most natural and resourceful of poets. His power over the heroic couplet or quatrain is shown in his fable, *Mother Hubbard's Tale,* and in his curious verse memoir, *Colin Clout;* both of which are medleys of satire and flattery. With formal tasks so various and so hard, it is wonderful how effortless the style of Spenser remains. His *Muiopotmos* is the lightest-handed of mock-heroics. No writer of his day except Marlowe was so faithful to the law of beauty.

Spenserians.—The mantle of Spenser fell, somewhat in shreds, upon poets of many schools until the Restoration. As though in thanks to his master Tasso, he lent to Edward Fairfax, the best translator of the *Jerusalem Delivered* (*Godfrey of Bulloigne,* 1600), some of his own ease and intricate melody. Harington,

the witty translator of Ariosto (1591) and spoilt child of the court, owed less to Spenser. The allegorical colouring was nobly caught, if sometimes barbarized, in the *Christ's Victory and Triumph* of the younger Giles Fletcher (1610), and Spenser's emblematic style was strained, even cracked, by Phineas Fletcher in *The Purple Island* (1633), an aspiring fable, gorgeous in places, of the human body and faculties. Both of these brethren clipped and marred the stanza, but they form a link between Spenser and their student Milton. The allegoric form, long-winded and broken-backed, survived late in Henry More's and Joseph Beaumont's verse disquisitions on the soul. Spenser's pastoral and allusive manner was followed by Drayton in his *Shepherd's Garland* (1593), and differently by William Browne in *Britannia's Pastorals* (1613–16), and by William Basse; while his more honeyed descriptions took on a mawkish taste in *Britain's Ida* (now known to be by Phineas Fletcher) and similar poems. His golden Platonic style was buoyantly echoed in *Orchestra* (1596), Sir John Davies' poem on the dancing spheres. He is continually traceable in 17th century verse, blending with the alien currents of Ben Jonson and of Donne. He was edited and imitated in the age of Thomson, in the age of William Morris, and constantly between.

The typical Elizabethan poet is Michael Drayton; who followed Spenser in pastoral, Daniel, Sidney, Spenser and Shakespeare in sonnet, Daniel again in chronicle and legend, and Marlowe in mythological story, and who yet remained himself. His *Endimion and Phoebe* in passages stands near *Hero and Leander;* his *England's Heroical Epistles* (1597) are in ringing rhetorical couplets; his *Odes* (1606), like the *Ballad of Agincourt* and the *Virginian Voyage,* forestall and equal Cowper's or Campbell's; his *Nymphidia* (1627) was the most popular of burlesque fairy poems; and his pastorals are full of graces and felicities. The work of Drayton that is least read and most often mentioned is his *Poly-Olbion* (1612–22), a vast and pious effort, now and then nobly repaid, to versify the scenery, legend, customs and particularities of every English county. The more recluse and pensive habit of Samuel Daniel chills his long chronicle poems; but with Chapman he is the clearest voice of Stoicism in Elizabethan letters; and his harmonious nature is perfectly expressed in a style of happy, even excellence, free alike from "fine madness" and from strain. Sonnet and epistle are his favoured forms, and in his *Musophilus* (1599) as well as in his admirable prose *Defence of Rhyme* (1602), he truly prophesies the hopes and glories of that *illustre vulgare,* the literary speech of England. All this patriotic and historic verse, like the earlier and ruder *Albion's England* (1586) of William Warner, or Fitzgeoffrey's poem upon Drake, or the outbursts of Spenser, was written during or inspired by the last 20 years of the queen's reign; and the same is true of Shakespeare's and most of the other history plays, which duly eclipsed the formal, rusty-gray chronicle poem of the type of the *Mirror for Magistrates,* though editions (1559–1610) of the latter were long repeated. Patriotic verse outside the theatre, however full of zeal, started at a disadvantage compared with love-sonnet, song, or mythic narrative, because it had no models before it in other lands, and remained therefore the more shapeless.

Sonnets.—The English love-sonnet, brought in by Wyatt and rifest between 1590 and 1600, was revived as a purely studious imitation by Watson in his *Hekatompathia* (1582), a string of translations in one of the exceptional measures that were freely entitled "sonnets." But from the first, in the hands of Sidney, whose *Astrophel and Stella* (1591) was written, as remarked above, about 1581, the sonnet was ever ready to pulse into feeling, and to flash into unborrowed beauty, embodying sometimes dramatic fancy and often living experience. These three fibres of imitation, imagination and confession are intertwisted beyond severance in many of the cycles, and now one, now another is uppermost. Incaution might read a personal diary into Thomas Lodge's *Phillis* (1593), which is often a translation from Ronsard. Literal judges have announced that Shakespeare's *Sonnets* are but his mode of taking exercise. But there is poetry in "God's plenty" almost everywhere; and few of the series fail of lovely lines or phrasing or even of perfect sonnets. This holds of Henry Constable's *Diana* (1592), of the *Parthenophil and Parthenophe* of Barnabe Barnes (1593), inebriate with poetry, and of the stray minor groups, *Alcilia, Licia, Caelia;* while the *Caelica* of Fulke Greville, Lord Brooke, in irregular form, is full of metaphysical passion struggling to be delivered. *Astrophel and Stella,* Drayton's *Idea* (1594–1619), Spenser's *Amoretti* and Shakespeare's *Sonnets* (printed 1609) are addressed to definite and probably to known persons, and are charged with true poetic rage, ecstatic or plaintive, desperate or solemn, if they are also intermingled with the mere word-play that mocks or beguiles the ebb of feeling, or with the purely plastic work that is done for solace. In most of these series, as in Daniel's paler but exquisitely-wrought *Delia* (1591–92), the form is that of the three separate quatrains with the closing couplet for emotional and melodic climax; a scheme slowly but defiantly evolved, through traceable gradations, from that stricter one of Italy, which Drummond and Milton revived, and where the crisis properly coincides with the change from octave to sestet.

The amorous mythologic tale in verse derives immediately from contemporary Italy, but in the beginning from Ovid, whose *Metamorphoses,* familiar in Golding's old version (1555–57), furnished descriptions, decorations and many tales, while his *Heroides,* of which Turberville's translation went through five editions between 1567 and 1600, provided a model for the self-anatomy of tragic or plaintive sentiment. Within ten years, between 1588 and 1598, during the early sonnet-vogue, appeared Lodge's *Scillaes Metamorphosis,* Shakespeare's *Venus and Adonis* and *Rape of Lucrece,* Marlowe's *Hero and Leander* and Drayton's *Endimion and Phoebe.* Shakespeare owed something to Lodge, and Drayton to Marlowe. All these poets describe a love-situation at length, and save in one instance they describe it from without. The exception is Marlowe, who achieves a more than Sicilian perfection; he says everything, and is equal to everything that he has to say. In *Venus and Adonis* the poet is enamoured less of love than of the tones and poses of lovers and of the beauty and gallant motion of animals, while in *The Rape of Lucrece* he is intent on the gradations of lust, shame and indignation, in which he has a spectator's interest. Virtuosity, or the delight of the executant in his own brilliant cunning, is the mark of most of these pieces.

Lyric.—If we go to the lyrics, the versified mythic tales and the sonnets of Elizabethan times for the kind of feeling that Molière's *Alceste* loved and that Burns and Shelley poured into song, we shall often come away disappointed, and think the old poetry heartless. But it is not heartless, any more than it is always impassioned or personal; it is decorative. The feeling is often that of the craftsman; it is not of the singer who spends his vital essence in song and commands an answering thrill so long as his native language is alive or understood. The arts that deal with ivories or enamelling or silver suggest themselves while we watch the delighted tinting and chasing, the sense for gesture and grouping (in *Venus and Adonis*), or the delicate beating out of rhyme in a madrigal, or the designing of a single motive, or two contrasted motives, within the panel of the sonnet. And soon it is evident how passion and emotion readily become plastic matter too, whether they be drawn from books or observation or self-scrutiny. This is above all the case in the sonnet; but it is found in the lyric as well. The result is a wonderful fertility of lyrical pattern, a wonderfully diffused power of lyrical execution, never to recur at any later time of English literature. Wyatt had to recover the very form of such verse from oblivion, and this he did in the school of translation and adaptation. Not only the decasyllabic, but the lyric, in short lines had almost died out of memory, and Wyatt brought it back. From his day to Spenser's there is not much lyric that is noteworthy, though in Gascoigne and others the impulse is seen. The introduction of Italian music, with its favourite metrical schemes, such as the madrigal, powerfully schooled and coloured lyric: in especial, the caressing double ending, regular in Italian but heavier in English, became common. The Italian poems were often translated in their own measure, line by line, and the musical setting retained. Their tunes, or other tunes, were then coupled with new and original poems; and both

appeared together in the song-books of Dowland the lutanist, of Jones and Byrd (1588), and in chief (1601–19) of Thomas Campion. The words of Campion's songs are not only supremely musical in the wider sense, but are chosen for their singing quality. Misled awhile by the heresy that rhyme was wrong, he was yet a master of lovely rhyming, as well as of a lyrical style of great range, gaily or gravely happy. But, as with most of his fellows, singing is rather his calling than his consolation. The lyrics that are sprinkled in plays and romances are the finest of this period, and perhaps, in their kind, of any period. Shakespeare is the greatest in this province also; but the power of infallible and unforgettable song is often granted to slighter, gentler playwrights like Greene and Dekker, while it is denied to men of weightier build and sterner purpose like Chapman and Jonson. The songs of Jonson are indeed at their best of absolute and antique finish; but the irrevocable dew of night or dawn seldom lies upon them as it lies on the songs of Webster or of Fletcher. The best lyrics in the plays are dramatic; they must be read in their own setting. While the action stops, they seize and dally with the dominant emotion of the scene, and yet relieve it. The songs of Lodge and Breton, of Drayton and Daniel, of Oxford and Raleigh, and the fervid brief flights of the Jesuit Southwell, show the omnipresence of the vital gift, whether among professional writers of the journalistic type, or among poets whose gift was not primarily song, or among men of action and quality or men of religion, who only wrote when they were stirred. Lullaby and valentine and compliment, and love-plaint ranging from gallantry to desperation, are all there; and the Fortunate Hour, which visits commonly only a few men in a generation, and those but now and then in their lives, is never far off. But the master of melody, Spenser, left no songs, apart from his two insuperable wedding odes. And religious lyric is rarer before the reign of James. Much of the best lyric is saved for us by the various Miscellanies, *A Handful of Pleasant Delights* (1584), the *Phoenix Nest* (1593) and Davison's *Poetical Rhapsody* (1602); while other such collections, like *England's Helicon* (1600), were chiefly garlands of verse that was already in print.

There is plenty of satiric anger and raillery in the spirit of the time, but the most genuine part of it is drawn off into drama. Except for stray passages in Spenser, Drayton and others, formal satire, though profuse, was a literary unreal thing, a pose in the manner of Persius or Juvenal, and tiresome in expression. In this kind only Donne triumphed. The attempts of Lodge and Hall and Marston and John Davies of Hereford and Guilpin and Wither are for the most part simply wearisome in different ways, and satire waited for Dryden and his age. The attempt, however, persisted throughout. Wyatt was the first and last who succeeded in the genial, natural Horatian style.

Verse from Donne to Milton.—As the age of Elizabeth receded, some changes came slowly over non-dramatic verse. In Jonson as in John Donne (1573–1631), one of the greater poets of England, and in many writers after Donne, may be traced a kind of Counter-Renaissance, or revulsion against the natural man and his claims to pleasure—a revulsion from which regret for pleasure lost is seldom far. Poetry becomes more ascetic and mystical, and this feeling takes shelter alike in the Anglican and in the Roman faith. George Herbert (*The Temple*, 1633), the most popular, quaint and pious of the school, but the least poetical; Crashaw, with his one ecstatic vision (*The Flaming Heart*) and occasional golden stanzas; Henry Vaughan, who wrote from 1646 to 1678, with his mystical landscape and magical cadences; and Thomas Traherne, his fellow-dreamer, are the best known of the religious fantastics. But, earlier than most of these are Lord Herbert of Cherbury, and Habington with his *Castara* (1634), who show the same temper, if a fitful power and felicity. Such writers form the devouter section of the famous "metaphysical" or "fantastic" school, which includes, besides Donne its founder, pure amorists like Carew (whose touch on certain rhythms has no fellow), young academic followers like Cartwright and Cleveland (in whom survives the vein of satire that also marks the school), and Abraham Cowley, who wrote from 1633 to 1678, and was perhaps the most acceptable living poet about the middle of the century. In his *Life of Cowley* Johnson tramples on the "metaphysical" poets and their vices, and he is generally right in detail. The shock of cold quaintness, which every one of them continually administers, is fatal. Johnson only erred in ignoring all their virtues and all their historical importance.

In Donne poetry became deeply intellectualized, and in temper disquisitive and introspective. The poet's emotion is played with in a cat-and-mouse fashion, and he torments it subtly. Donne's passion is so real, if so unheard-of, and his brain so finely-dividing, that he can make almost any image, even the remotest, even the commonest, poetical. His satires, his *Valentine*, his *Litany*, and his lyric or odic pieces in general, have an insolent and sudden daring which is warranted by deep-seated power and is only equalled by a few of those tragedians who are his nearest of kin. The recurring contrast of "wit" or intelligence, and "will" or desire, their struggle, their mutual illumination, their fusion as into some third and undiscovered element of human nature, are but one idiosyncrasy of Donne's intricate soul, whose progress, so far as his often dateless poems permit of its discovery, seems to have been from a paganism that is unashamed but crossed with gusts of compunction, to a mystical and otherworldly temper alloyed with covetous regrets. The *Anatomy of the World* and other ambitious pieces have the same quality amid their outrageous strangeness. In Donne and his successors the merely ingenious and ransacking intellect often came to overbalance truth and passion; and hence arose conceits and abstract verbiage, and the difficulty of finding a perfect poem, however brief, despite the omnipresence of the poetic gift. The "fantastic" school, if it contains some of the rarest sallies and passages in English, is one of the least satisfactory. Its faults only exaggerate those of Sidney, Greville and Shakespeare, who often misuse homely or technical metaphor; and English verse shared, by coincidence not by borrowing, and with variations of its own, in the general strain and torture of style that was besetting so many poets of the Latin countries. Yet these poets well earn the name of metaphysical not for their philosophic phrasing, but for the shuttle-flight of their fancy to and fro between the things of earth and the realities of spirit that lie beyond the screen of the flesh.

Between Spenser and Milton many measures of lyrical and other poetry were modified. Donne's frequent use of roughly-accentual, almost tuneless lines is unexplained and was not often followed. Rhythm in general came to be studied more for its own sake, and the study was rewarded. The lovely cordial music of Carew's amorous iambics, or of Wither's trochees, or of Crashaw's odes, or of Marvell's octosyllables, has never been regained. The formal ode set in, sometimes regularly "Pindaric" in strophe-grouping, sometimes irregularly "Pindaric" as in Cowley's experiments. Above all, the heroic couplet, of the isolated, balanced, rhetorical order, such as Spenser, Drayton, Fairfax and Sylvester, the translator (1590–1606) of Du Bartas, had often used, began to be a regular instrument of verse, and that for special purposes which soon became lastingly associated with it. The flatteries of Edmund Waller and the Ovidian translations of Sandys dispute the priority for smoothness and finish, though the fame was Waller's for two generations; but Denham's over-estimated *Cooper's Hill* (1642), Cowley's *Davideis* (1656), and even Ogilby's *Aeneid* made the path plainer for Dryden, the first sovereign of the rhetorical couplet which throve as blank verse declined. Sonnet and madrigal were the favoured measures of William Drummond of Hawthornden, a real and exquisite poet of the studio, who shows the general drift of verse towards sequestered and religious feeling. Drummond's *Poems* of 1616 and *Flowers of Zion* (1623) are full of Petrarch and Plato as well as of Christian resignation, and he kept alive the artistry of phrasing and versification in a time of indiscipline and conflicting forms. William Browne has been named as a Spenserian, but his *Britannia's Pastorals* (1613–16), with their slowly-rippling and overflowing couplets which influenced Keats, were a medley of a novel kind. George Wither may equally rank among the lighter followers of Spenser, the easy masters of lyrical narrative, and the devotional poets. But his *Shepherd's Hunting* and other pieces in

his volume of 1622 contain lovely landscapes, partly English and partly artificial, and stand far above his pious works, and still further above the dreary satires which he lived to continue after the Restoration.

Of poets yet unmentioned, Robert Herrick is the chief, with his 2,000 lyrics and epigrams, gathered in *Hesperides and Noble Numbers* (1648). His power of song and sureness of cadence are not excelled within his range of topic, which includes flowers and maidens—whom he treats as creatures of the same race—and the swift decay of both their beauties, and secular regret over this decay and his own mortality and the transience of amorous pleasure, and the virtues of his friends, and country sports and lore, and religious compunction for his own paganism. The *Hesperides* are pure Renaissance work, in natural sympathy with the Roman elegiac writings and with the Pseudo-Anacreon. Cowley is best where he is nearest Herrick, and his posy of short lyrics outlives his "epic and Pindaric art." There are many writers who last by virtue of one or two poems; Suckling by his adept playfulness, Lovelace and Montrose by a few gallant stanzas, and many a nameless poet by many a consummate cadence. It is the age of sudden flights and brief perfections. All the farther out of reach, yet never wholly despaired of or unattempted in England, was the "long poem," heroical and noble, the "phantom epic," that shadow of the ancient masterpieces, which had striven to life in Italy and France. Davenant's *Gondibert* (1651), Cowley's *Davideis* and Chamberlayne's *Pharonnida* (1659) attest the effort which Milton in 1658 resumed with triumph. These works have between them all the vices possible to epic verse, dulness and flatness, faintness and quaintness and incoherence. But there is some poetry in each of them, and in *Pharonnida* there is far more than enough poetry to save it.

Milton.—Few writers have found a flawless style of their own so early in life as John Milton (1608–74). His youthful pieces show some signs of Spenser and the Caroline fantastics; but soon his vast poetical reading ran clear and lay at the service of his talent. His vision and phrasing of natural things were already original in the *Nativity Ode,* written when he was 20; and, there also, his versification was that of a master, of a renovator. There is the pensive, figured beauty of *L'Allegro* and *Il Penseroso,* two contrasted emblematic panels, the high innocent Platonism and golden blank verse of the *Comus* (1634); the birth of long-sleeping power in the *Lycidas* (1637), with its unapproached contrivance both in evolution and detail, where the precious essences of earlier myth and pastoral seem to be distilled for an offering in honour of the tombless friend; we remark the promise, the sureness of it all amid the current schools. The historian finds in these poems, with their echoes of Plato and Sannazzaro, of Geoffrey of Monmouth and St. John, the richest and most perfect instance of the studious, decorative Renaissance style, and is not surprised to find Milton's scholars a century later in the age of Gray. The critic, while feeling that the strictly lyrical, spontaneous element is absent, is all the more baffled by the skill and enduring charm. The sonnets were written before or during Milton's long immersion (1637–58) in prose and warfare, and show the same gifts. They are not cast in the traditional form of love-cycle, but are occasional poems; in metre they revert, not always strictly but once or twice in full perfection, to the Italian scheme; and they recall not Petrarch but the spiritual elegies or patriot exaltations of Dante or Guidiccioni.

Milton also had a mediaeval side to his brain, as the *History of Britain* shows. The heroic theme, which he had resolved from his youth up to celebrate, at last, after many hesitations, proved to be the fall of man. This, for one of his creed and for the audience he desired, was the greatest theme of all. Its scene was the Ptolemaic universe with the Christian heaven and hell inserted. The time, indicated by retrospect and prophecy, was the whole of that portion of eternity, from the creation of Christ to the doomsday, of which the history was sacredly revealed. The subject and the general span of the action went back to the popular mystery play; and Milton at first planned out *Paradise Lost* as such a play, with certain elements of classic tragedy embodied. But according to the current theory the epic, not the drama, was the noblest form of verse; and, feeling where his power lay, he adopted the epic. The subject, therefore, was partly mediaeval, partly Protestant—for Milton was a true Protestant in having a variant of doctrine shared by no other mortal. But the ordering and presentment, with their overture, their interpolated episodes or narratives, their journeys between Olympus, earth and hell, invocations, set similes, battles and divine thunderbolts, are those of the classical epic. Had Milton shared the free thought as well as the scholarship of the Renaissance, the poem could never have existed. With all his range of soul and skill, he had a narrower speculative brain than any poet of equal gift; and this was well for his great and peculiar task. But whatever Milton may fail to be, his heroic writing is the permanent and absolute expression of something that in the English stock is inveterate—the Promethean self-possession of the mind in defeat, its right to solitude there, its claim to judge and deny the victor. This is the spirit of his devils, beside whom his divinities, his unfallen angels (Abdiel excepted), and even his human couple with their radiance and beauty of line, all seem shadowy. The discord between Milton's doctrine and his sympathies in *Paradise Lost* (1667) has never escaped notice. The discord between his doctrine and his culture comes out in *Paradise Regained* (1671), when he has at once to reprobate and glorify Athens, the "mother of arts." In this afterthought to the earlier epic the action is slight, the Enemy has lost spirit, and the Christ is something of a pedagogue. But there is a new charm in its even, grey desert tint, sprinkled with illuminations of gold and luxury. In *Samson Agonistes* (1671) the ethical treatment as well as the machinery is Sophoclean, and the theology not wholly Christian. But the fault of Samson is forgotten in his suffering, which is Milton's own; and thus a cross-current of sympathy is set up, which may not be much in keeping with the story, but revives the somewhat exhausted interest and heightens a few passages into a bare and inaccessible grandeur.

The essential solitude of Milton's energies is best seen in his later style and versification. When he resumed poetry about 1658, he had nothing around him to help him as an artist in heroic language. The most recent memories of the drama were also the worst; the forms of Cowley and Davenant, the would-be epic poets, were impossible. Spenser's manner was too even and fluid as a rule for such a purpose, and his power was of an alien kind. Thus Milton went back, doubtless full of Greek and Latin memories, to Marlowe, Shakespeare and others among the greater dramatists (including John Ford); and their tragic diction and measure are the half-hidden bases of his own. The product, however, is unlike anything except the imitations of itself. The incongruous elements of the *Paradise Lost* and its divided sympathies are cemented, at least superficially, by its style, perhaps the surest for dignity, character and beauty that any Germanic language has yet developed. If dull and pedantic over certain stretches, it is usually infallible. It is many styles in one, and Time has laid no hand on it. In these three later poems its variety can be seen. It is perfect in personal invocation and appeal; in the complex but unfigured rhetoric of the speeches; in narrative of all kinds; for the inlaying work of simile or scenery or pageant, where the quick, pure impressions of Milton's youth and prime—possibly kept fresher by his blindness—are felt through the sometimes conventional setting; and for soliloquy and choric speech of a might unapproachable since Dante. To these calls his blank verse responds at every point. It is the seal of Milton's artistry, as of his self-confidence, for it greatly extends, for the epical purpose, all the known powers and liberties of the metre; and yet, as has often been shown, it does so not spasmodically but within fixed technical laws or rather habits. Latterly, the underlying metrical *ictus* is at times hard to detect. But Milton remains by far the surest and greatest instrumentalist, outside the drama, on the English unrhymed line. He would, however, have scorned to be judged on his form alone. His soul and temper are not merely unique in force. Their historic and representative character ensure attention, so long as the oppositions of soul and temper in the England of Milton's time remain, as they still are, the deepest in the national life. He

is sometimes said to harmonize the Renaissance and the Puritan spirit; but he does not do this, for nothing can do it. The Puritan spirit is the deep thing in Milton; all his culture only gives immortal form to its expression. The critics have instinctively felt that this is true; and that is why their political and religious prepossessions have nearly always coloured, and perhaps must colour, every judgment passed upon him. Not otherwise can he be taken seriously, until historians are without public passions and convictions, or the strife between the hierarch and the Protestant is quenched in English civilization.

Drama, 1580–1642.—We must now go back to the drama, which lies behind Milton, and is the most individual product of all English literature. The nascent drama of genius can be found in the "University wits," who flourished between 1580 and 1595, and the chief of whom are Lyly, Peele, Greene, Kyd and Marlowe. John Lyly is the first practitioner in prose of shapely comic plot and pointed talk—the artificial but actual talk of courtly masquers who rally one another with a bright and barren finish that is second nature. *Campaspe, Sapho and Phao, Midas,* and Lyly's other comedies, mostly written from 1580 to 1591, are frail vessels, often filled with compliment, mythological allegory, or topical satire, and enamelled with pastoral interlude and flower-like song. The work of Thomas Kyd, especially *The Spanish Tragedy* (written *c.* 1585), was the most violent effort to put new wine into the old Senecan bottles, and he probably wrote the lost pre-Shakespearian *Hamlet.* He transmitted to the later drama that subject of pious but ruinous revenge, which is used by Chapman, Marston, Webster and many others; and his chief play was translated and long acted in Germany. Kyd's want of modulation is complete, but he commands a substantial skill of dramatic mechanism, and he has more than the feeling for power, just as Peele and Greene have more than the feeling for luxury or grace. To the expression of luxury Peele's often stately blank verse is well fitted, and it is by far the most correct and musical before Marlowe's, as his *Arraignment of Paris* (1584) and his *David and Bethsabe* attest. Greene did something to create the blank verse of gentle comedy, and to introduce the tone of idyll and chivalry, in his *Friar Bacon and Friar Bungay* (1594). Otherwise these writers, with Nashe and Lodge, fall into the wake of Marlowe.

Tamburlaine, in two parts (part 1, *c.* 1587), *The Life and Death of Doctor Faustus, The Jew of Malta, Edward II.* (the first chronicle play of genius), and the incomplete poem *Hero and Leander* are Christopher Marlowe's title-deeds (1564–93). He established tragedy, and inspired its master, and created for it an adequate diction and versification. His command of vibrant and heroic recitative should not obscure his power, in his greater passages (describing the descent of Helen, the passing of Mortimer and the union of Hero and Leander), to attain a kind of Greek transparency and perfection. The thirst for ideal beauty, for endless empire and for prohibited knowledge, no poet has better expressed, and in this respect Giordano Bruno is nearest him in his own time. This thirst is his own; his great cartoon-figures, gigantic rather than heroic, proclaim it for him: their type recurs through the drama, from Richard III. to Dryden's orotund heroes; but in *Faustus* and in *Edward II.* they become real, almost human beings. His constructive gift is less developed in proportion, though Goethe praised the planning-out of *Faustus.* The glory and influence of Marlowe on the side of form rest largely on his meteoric blank lines, which are varied not a little, and nobly harmonized into periods, and resonant with names to the point of splendid extravagance; and their sound is heard in Milton, whom he taught how to express the grief and despair of demons dissatisfied with their kingdom. Shakespeare did not excel Marlowe in Marlowe's own excellences, though he humanized Marlowe's Jew, launched his own blank verse on the tide of Marlowe's oratory and modulated, in *Richard II.,* his master's type of chronicle tragedy.

Shakespeare.—As the middle ages receded, the known life of man upon this earth became of sovereign interest, and of this interest the drama is the freest artistic expression. If Marlowe is the voice of the impulse to explore, the plays of Shakespeare are the amplest freight brought home by any voyager. Shakespeare is not only the greatest but the earliest English dramatist who took humanity for his province. But this he did not do from the beginning. He was at first subdued to what he worked in; and though the dry pedantic tragedy was shattered and could not touch him, the gore and rant, the impure though genuine force of Kyd do not seem at first to have repelled him, if, as is likely, he had a hand in *Titus Andronicus.* He probably served with Marlowe and others of the school at various stages in the composition of the three chronicle dramas finally entitled *Henry VI.* But besides the high-superlative style that is common to them all, there runs through them the rhymed rhetoric with which Shakespeare dallied for some time, as well as the softer flute-notes and deeper undersong that foretell his later blank verse. In *Richard III.,* though it is built on the scheme and charged with the style of Marlowe, Shakespeare first showed the intensity of his original power. But after a few years he swept out of Marlowe's orbit into his own vaster and unreturning curve. In *King John* the lyrical, epical, satirical and pathetic chords are all present, if they are scarcely harmonized. Meantime, Lyly and Greene having displaced the uncouther comedy, Shakespeare learned all they had to teach, and shaped the comedy of poetic, chivalrous fancy and good-tempered high spirits, which showed him the way of escape from his own rhetoric, and enabled him to perfect his youthful, noble and gentle blank verse. This attained its utmost fineness in *Richard II.,* and its full cordiality and beauty in the other plays that consummate this period—*A Midsummer Night's Dream, The Merchant of Venice,* and one romantic tragedy, *Romeo and Juliet.* Behind them lay the earlier and fainter romances, with their chivalry and gaiety, *The Comedy of Errors, Love's Labour's Lost* and *The Two Gentleman of Verona.* Throughout these years blank verse contended with rhyme, which Shakespeare after a while abandoned save for special purposes, as though he had exhausted its honey. The Italian Renaissance is felt in the scenery and setting of these plays. The *novella* furnishes the story, which passes in a city of the Southern type, with its absolute ruler, its fantastic by-laws on which the plot nominally turns, and its mixture of real life and marvel. The personages, at first fainter of feature and symmetrically paired, soon assume sharper outline: Richard II. and Shylock, Portia and Juliet, and Juliet's Nurse and Bottom are created. The *novella* has left the earth and taken wings: the spirit is now that of youth and Fancy (or love brooding among the shallows) with interludes of "fierce vexation," or of tragedy, or of kindly farce. And there is a visionary element, felt in the musings of Theseus upon the nature of poetry, of the dream-faculty itself; an element which is new, like the use made of fairy folklore, in the poetry of England.

Tragedy is absent in the succeeding histories (1597–99), and the comedies of wit and romance (1599–1600), in which Shakespeare perfected his style for stately, pensive or boisterous themes. Falstaff, the most popular as he is the wittiest of all imaginable comic persons, dominates, as to their prose or lower world, the two parts of *Henry IV.,* and its interlude or offshoot, *The Merry Wives of Windsor.* The play that celebrates Henry V. is less a drama than a pageant, diversified with mighty orations and cheerful humours, and filled with the love of Shakespeare for England. Here the most indigenous form of art invented by the English Renaissance reaches its climax. The Histories are peopled chiefly by men and warriors, of whom Hotspur, "dying in his excellence and flower," is perhaps more attractive than Henry of Agincourt. But in the "middle comedies," *As You Like It, Much Ado* and *Twelfth Night,* the warriors are home at court, where women rule the scene and deserve to rule it; for their wit now gives the note; and Shakespeare's prose, the medium of their talk, has a finer grace and humour than ever before, euphuism lying well in subjection behind it.

Mankind and this world have never been so sharply sifted or so sternly consoled, since Lucretius, as in Shakespeare's tragedies. The energy which created them evades, like that of the sun, our estimate. But they were not out of relation to their time, the first few years of the reign of James, with its conspiracies, its Somerset and Overbury horrors, its enigmatic and sombre figures like Raleigh, and its revulsion from Elizabethan buoyancy. In the

same decade were written the chief tragedies of Jonson, Chapman, Dekker, Marston, Tourneur; and *The White Devil,* and *A Yorkshire Tragedy,* and *The Maid's Tragedy,* and *A Woman Killed with Kindness.* But, in spite of Shakespeare's affinities with these authors at many points, *Hamlet, Macbeth, Lear, Othello,* with the three Roman plays (written at intervals and not together), and the two quasi-antique plays *Troilus and Cressida* and *Timon of Athens,* form a body of drama apart from anything else in the world. They reveal a new tragic philosophy, a new poetic style, a new dramatic technique and a new world of characters. In one way above all Shakespeare stands apart; he not only appropriates the ancient pattern of heroism, of right living and right dying, revealed by North's Plutarch; others did this also; but the intellectual movement of the time, though by no means fully reflected, is reflected in his tragedies far more than elsewhere. The new and troublous thoughts on man and conduct that were penetrating the general mind, the freedom and play of vision that Montaigne above all had stimulated, here find their fullest scope; and Florio's translation (1603) of Montaigne's *Essays,* coming out between the first and the second versions of Shakespeare's *Hamlet,* counted probably for more than any other book. The *Sonnets* (published 1609) are also full of far-wandering thoughts on truth and beauty and on good and evil. The story they reveal may be ranked with the situations of the stranger dramas like *Troilus* and *Measure for Measure.* But whether or no it is a true story, and the *Sonnets* in the main a confession, they would be at the very worst a perfect dramatic record of a great poet's suffering and friendship.

Shakespeare's last period, that of his tragi-comedies, begins about 1608 with his contributions to *Pericles, Prince of Tyre.* For unknown reasons he was moved, about the time of his retirement home, to record, as though in justice to the world, the happy turns by which tragic disaster is at times averted. *Pericles, The Winter's Tale, Cymbeline* and *The Tempest* all move, after a series of crimes, calumnies or estrangements, to some final scene of enthralling beauty, where the lost reappear and love is recovered; as though after all the faint and desperate last partings—of Lear and Cordelia, of Hamlet and Horatio—which Shakespeare had imagined, he must make retrieval with the picture of young and happy creatures whose life renews hope even in the experienced. To this end he chose the loose action and free atmosphere of the *roman d'aventure,* which had already been adapted by Beaumont and Fletcher, who may herein have furnished Shakespeare with novel and successful theatrical effects, and who certainly in turn studied his handiwork. In *The Tempest* this tragi-comic scheme is fitted to the tales brought by explorers of far isles, wild men, strange gods and airy music. Even if it be true that in Prospero's words the poet bids farewell to his magic, he took part later nevertheless in the composition of *Henry VIII.;* and not improbably also in *The Two Noble Kinsmen.* His share in two early pieces, *Arden of Feversham* (1592) and *Edward III.,* has been urged but never established, and of many other dramas he was once idly accused.

Shakespeare's throne rests on the foundation of three equal and master faculties. One is that of expression and versification; the next is the invention and presentation of human character in action; the third is the theatrical faculty. The writing of Dante may seem to us more steadily great and perfect, when we remember Shakespeare's conceits, his experiments, his haste and impatience in his long wrestle with tragic language, his not infrequent sheer infelicities. But Dante is always himself, he had not to find words for hundreds of imaginary persons. Balzac, again, may have created and exhibited as many types of mankind, but except in soul he is not a poet. Shakespeare is a supreme if not infallible poet; his verse, often of an antique simplicity or of a rich, harmonious, romantic perfection, is at other times strained and shattered with what it tries to express, and attains beauty only through discord. He is also many persons in one; in his *Sonnets* he is even, it may be thought, himself. But he had furthermore to study a personality not of his own fancying—with something in it of Caliban, of Dogberry and of Cleopatra—that of the audience in a playhouse. He belongs distinctly to the poets like Jonson and Massinger who are true to their art as practical dramatists, not to the poets like Chapman whose works chance to be in the form of plays. Shakespeare's mastery of this art is approved now by every nation. But apart from the skill that makes him eternally actable—the skill of raising, straining and relieving the suspense, and bringing it to such an ending as the theatre will tolerate—he played upon every chord in his own hearers. He frankly enlisted Jew-hatred, Pope-hatred and France-hatred; he flattered the queen, and celebrated the Union, and stormed the house with his *fanfare* over the national soldier, Henry of Agincourt, and glorified England, as in *Cymbeline,* to the last. But in deeper ways he is the chief of playwrights. Unlike another master, Ibsen, he nearly always tells us, without emphasis, by the words and behaviour of his characters, which of them we are to love and hate, and when we are to love and when to hate those whom we can neither love nor hate wholly. Yet he is not to be bribed, and deals to his characters something of the same injustice or rough justice that is found in real life. His loyalty to life, as well as to the stage, puts the crown on his felicity and his fertility, and raises him to his solitude of dramatic greatness.

Jonson.—Shakespeare's method could not be imparted, and despite reverberations in Beaumont, Fletcher, Webster and others he left no school. But his friend Ben Jonson, his nearest equal in vigour of brain, though not in poetical intuition, was the greatest of dramatic influences down to the shutting of the theatres in 1642, and his comedies found fresh disciples even after 1660. He had "the devouring eye and the portraying hand"; he could master and order the contents of a mighty if somewhat burdensome memory into an organic drama, whether the matter lay in Roman historians or before his eyes in the London streets. He had an armoury of doctrine, drawn from the *Poetics* and Horace, which moulded his creative practice. This was also partly founded on a revulsion against the plays around him, with their loose build and moral improbabilities. But in spite of his photographic and constructive power, his vision is too seldom free and genial; it is that of the satirist who thinks that his office is to improve mankind by derisively representing it. And he does this by beginning with the "humour," or abstract idiosyncrasy or quality, and clothing it with accurately minute costume and gesture, so that it may pass for a man; and indeed the result is as real as many a man, and in his best-tempered and youthful comedy *Every Man in his Humour* (acted 1598), it is very like life. In Jonson's monumental pieces, *Volpone or the Fox* (acted 1605) and *The Alchemist* (acted 1610), our laughter is arrested by the lowering and portentous atmosphere, or is loud and hard, startled by the enormous skill and energy displayed. Nor are the joy and relief of poetical comedy given for an instant by *The Silent Woman, Bartholomew Fair* (acted 1614), or *The Staple of News,* still less by topical plays like *Cynthia's Revels,* though their unfailing farce and rampant fun are less charged with contempt. The erudite tragedies, *Sejanus* (acted 1603) and *Catiline,* chiefly live by passages of high forensic power. Jonson's finer elegies, eulogies and lyrics, which are many, and his fragmentary *Sad Shepherd,* show that he also had a free and lovely talent, often smothered by doctrine and temper; and his verse, usually strong but full of knots and snags, becomes flowing and graciously finished. His prose is of the best, especially in his *Discoveries,* a series of ethical essays and critical maxims; its prevalently brief and emphatic rhythms suggesting those of Hobbes, and even, though less easy and civil and various, those of Dryden. The "sons" of Jonson, Randolph and Browne, Shadwell and Wilson, were heirs rather to his riot of "humours," his learned method and satiric aim, than to his larger style, his architectural power or his relieving graces.

Romantic Drama.—As a whole, the romantic drama (so to entitle the remaining bulk of plays down to 1642) is a vast stifled jungle, full of wild life and song, with strange growths and heady perfumes, with glades of sunshine and recesses of poisoned darkness; it is not a cleared forest, where single and splendid trees grow to shapely perfection. It has "poetry enough for anything"; passionate situations, and their eloquence; and a number, doubtless small considering its mass, of living and memorable person-

ages. Moral keeping and constructive mastery are rarer still; and too seldom through a whole drama do we see human life and hear its voices, arranged and orchestrated by the artist. But it can be truly said in defence that while structure without poetry is void (as it tended at times to be in Ben Jonson), poetry without structure is still poetry, and that the romantic drama is like nothing else in this world for variety of accent and unexpectedness of beauty. We must read it through, as Charles Lamb did, to do it justice. The diffusion of its characteristic excellences is surprising. Of its extant plays it is hardly safe to leave one unopened, if we are searchers for whatsoever is lovely or admirable. The reasons for the lack of steadfast power and artistic conscience lay partly in the conditions of the stage. Playwrights usually wrote rapidly for bread, and sold their rights. The performances of each play were few. There was no authors' copyright, and dramas were made to be seen and heard, not to be read. There was no articulate dramatic criticism, except such as we find casually in Shakespeare, and in the practice and theory of Jonson, who was deaf or hostile to some of the chief virtues of the romantic playwrights.

The wealth of dramatic production is so great that only a broad classification is here offered. George Chapman stands apart, nearest to the greatest in high austerity of sentiment and in the gracious gravity of his romantic love-comedies. But the crude melodrama of his tragedies is void of true theatrical skill. His quasi-historical French tragedies on Bussy d'Ambois and Biron and Chabot best show his gift and also his insufferable interrupting quaintness. His versions of Homer (1598–1624), honoured alike by Jonson and by Keats, are the greatest verse translations of the time, and the real work of Chapman's life. Their virtues are only partially Homer's, but the general epic nobility and the majesty of single lines, which in length are the near equivalent of the hexameter, redeem the want of Homer's limpidity and continuity and the translator's imperfect knowledge of Greek. A vein of satiric ruggedness unites Jonson and Chapman with Marston and Hall, the professors of an artificial and disgusting invective; and the same strain spoils Marston's plays, and obscures his genuine command of the language of feverish and bitter sentiment. With these writers satire and contempt of the world lie at the root both of their comedy and tragedy.

It is otherwise with most of the romantic dramatists, who may be broadly grouped as follows. (*a*) Thomas Dekker and Thomas Heywood are writers-of-all-work, the former profuse of tracts and pamphlets, the latter of treatises and compilations. They are both unrhetorical and void of pose, and divide themselves between the artless comedy of bustling, lively, English humours and pathetic, unheroic tragedy. But Dekker has splendid and poetical dreams, in *Old Fortunatus* and *The Honest Whore*, both of luxury and of tenderness; while Heywood, as in his *English Traveller* and *Woman killed with Kindness*, excels in pictures of actual, chivalrous English gentlemen and their generosities. The fertility and volubility of these writers, and their modest carelessness of fame, account for many of their imperfections. With them may be named the large crowd of professional journeymen, who did not want for power, but wrote usually in partnership together, like Munday, Chettle and Drayton, or supplied, like William Rowley, underplots of rough, lively comedy or tragedy. (*b*) Amongst dramatists of primarily tragic and sombre temper, who in their best scenes recall the creator of Angelo, Iago and Timon, must be named Thomas Middleton, John Webster, and Cyril Tourneur. Middleton has great but scattered force, and his verse has the grip and ring of the best period without a sign of the decadence. He is strong in high comedy, like *The Old Law*, that turns on some exquisite point of honour—"the moral sense of our ancestors"; in comedy that is merely graphic and vigorous; and in detached sketches of lowering wickedness and lust, like those in *The Changeling* and *Women beware Women*. He and Webster each created one unforgettable desperado, de Flores in *The Changeling* and Bosola in *The Duchess of Malfi* (whose "pity," when it came, was "nothing akin to him"). In Webster's other principal play, *Vittoria Corombona, or the White Devil*, the title-character is not less magnificent in defiant crime than Goneril or Lady Macbeth. The style of Webster, for all his mechanical horrors, distils the essences of pity and terror, of wrath and scorn, and is profoundly poetical; and his point of view seems to be blank fatalism, without Shakespeare's ever-arching rainbow of moral sympathy. Cyril Tourneur, in *The Revenger's Tragedy*, is even more of a poet than Webster; he can find the phrase for half-insane wrath and nightmare brooding, but his chaos of impieties revolts the artistic judgment. These specialists, when all is said, are great men in their dark province. (*c*) The playwrights who may be broadly called romantic, of whom Beaumont, Fletcher and Massinger are the chief, while they share in the same sombre vein, have a wider range and move more in the daylight. The three just named left a very large body of drama, tragic, comic and tragi-comic, in which their several shares can partly be discerned by metrical or other tests. Beaumont is nearest the prime, with his vein of Cervantesque mockery and his pure, beautifully-broken and cadenced verse, which is seen in his contributions to *Philaster* and *The Maid's Tragedy*. Fletcher brings us closest to the actual gaieties and humours of Jacobean life; he has a profuse comic gift and the rare instinct for natural dialogue. His verse, with its flood of vehement and expansive rhetoric, heard at its best in plays like *Bonduca*, cannot cheat us into the illusion that it is truly dramatic; but it overflows with beauty, like his silvery but monotonous versification with its hendecasyllabics arrested at the end. In Fletcher the decadence of form and feeling palpably begins. His personages often face about at critical instants and bely their natures by sudden revulsions. Wanton and cheap characters invite not only dramatic but personal sympathy, as though the author knew no better. There is too much fine writing about a chastity which is complacent rather than instinctive, and satisfied with its formal resistances and technical escapes; so that we are far from Shakespeare's heroines. These faults are present also in Philip Massinger, who offers in substantial recompense, not like Beaumont and Fletcher treasures of incessant vivacious episode and poetry and lyric interlude, but an often splendid and usually solid constructive skill, and a steady eloquence which is like a high table-land without summits. *A New Way to Pay Old Debts* is the most enduring popular comedy of the time outside Shakespeare's, and one of the best. Massinger's interweaving of impersonal or political conceptions, as in *The Bondman* and *The Roman Actor*, is often a triumph of arrangement; and though he wrote in the reign of Charles, he is saved by many noble qualities from being merely an artist of the decline. (*d*) A mass of plays, of which the authorship is unknown, uncertain or attached to a mere name, baffle classification. There are domestic tragedies, such as *Arden of Feversham;* scions of the vindictive drama, like *The Second Maiden's Tragedy;* historic or half-historic tragedies like *Nero*. There are chronicle histories, of which the last and one of the best is Ford's *Perkin Warbeck*, and melodramas of adventure such as Thomas Heywood poured forth. There are realistic citizen comedies akin to *The Merry Wives*, like Porter's refreshing *Two Angry Women of Abingdon;* there are Jonsonian comedies, vernacular farces, light intrigue-pieces like Field's and many more. Few of these, regarded as wholes, come near to perfection; few fail of some sally or scene that proves once more the unmatched diffusion of the dramatic or poetic instinct. (*e*) Outside the regular drama there are many varieties: academic plays, like *The Return from Parnassus* and *Lingua*, which are still mirthful; many pastoral plays or entertainments in the Italian style, like *The Faithful Shepherdess;* versified character-sketches, of which Day's *Parliament of Bees*, with its Theocritean grace and point, is the happiest; many masques and shows, often lyrically and scenically lovely, of which kind Jonson is the master, and Milton, in his *Comus*, the transfigurer; Senecan dramas made only to be read, like Daniel's and Fulke Greville's; and Latin comedies, like *Ignoramus*. All these species are only now being fully grouped, sifted and edited by scholars, but a number of the 600 or 700 dramas of the time remain unreprinted.

There remain two writers, John Ford and James Shirley, who kept the higher tradition alive till the Puritan ordinance crushed

the theatre in 1642. Ford is another specialist, of grave, sinister and concentrated power (reflected in his verse and diction), to whom no topic, the incest of Annabella in *'Tis Pity She's a Whore,* or the high crazed heroism of Calantha in *The Broken Heart,* is beyond the pale, if only he can dominate it; as indeed he does, without complicity, standing above his subject. Shirley, a fertile writer, has the general characteristic gifts, in a somewhat dilute but noble form, of the more romantic playwrights, and claims honour as the last of them.

Prose from 1579 to 1660.—With all the unevenness of poetry, the sense of style, of a standard, is everywhere; felicity is never far off. Prose also is full of genius, but it is more disfigured than verse by aberration and wasted power. A central, classic, durable, adaptive prose had been attained by Machiavelli, and by Amyot and Calvin, before 1550. In England it was only to become distinct after 1660. Vocabulary, sentence-structure, paragraph, idiom and rhythm were in a state of unchartered freedom, and the history of their crystallization is not yet written. But in more than compensation there is a company of prose masters, from Florio and Hooker to Milton and Clarendon, not one of whom clearly or fully anticipates the modern style, and who claim all the closer study that their special virtues have been for ever lost. They seem farther away from us than the poets around them. The verse of Shakespeare is near to us, for its tradition has persisted; his prose, the most natural and noble of his age, is far away, for its tradition has not persisted. One reason of this difference is that English prose tried to do more work than that of France and Italy; it tried the work of poetry; and it often did that better than it did the normal work of prose. This overflow of the imaginative spirit gave power and elasticity to prose, but made its task of finding equilibrium the harder. Moreover, prose in England was for long a natural growth, never much affected by critical or academic canons as in France; and when it did submit to canons, the result was often merely manner. The tendons and sinews of the language, still in its adolescent power and bewilderment, were long unset; that is, the parts of speech—noun and verb, epithet and adverb—were in freer interchange than at any period afterwards. The build, length and cadence of a complex sentence were habitually elaborate; and yet they were disorganized, so that only the ear of a master could regulate them. The law of taste and measure, perhaps through some national disability, was long unperceived. Prose, in fact, could never be sure of doing the day's work in the right fashion. The cross-currents of pedantry in the midst of simplicity, the distrust of clear plain brevity, which was apt to be affected when it came, the mimicries of foreign fashions, and the quaintness and cumbrousness of so much average writing, make it easier to classify Renaissance prose by its interests than by its styles.

The Novel.—The Elizabethan novel was always unhappily mannered, and is mostly dead. It fed the drama, which devoured it. The tales of Boccaccio, Bandello, Cinthio, Margaret of Navarre, and various other writers were purveyed in the forgotten treasuries of Painter, Pettie, Fenton and Whetstone, and many of these works or their originals filled a shelf in the playwrights' libraries. The first of famous English novels, Lyly's *Euphues* (1578), and its sequel *Euphues and his England,* are documents of form. They are commended by a certain dapper shrewdness of observation and an almost witty priggery, not by any real beauty or deep feeling. Euphuism, of which Lyly was only the patentee, not the inventor, strikes partly back to the Spaniard Guevara, and was a model for some years to many followers like Lodge and Greene. It did not merely provide Falstaff with a pattern for mock-moral diction and vegetable similes. It genuinely helped to organize the English sentence, complex or coordinate, and the talk of Portia and Rosalind shows what could be made of it. By the arch-euphuists, clauses and clusters of clauses were paired for parallel or contrast, with the beat of emphatic alliteration on the corresponding parts of speech in each constituent clause. This was a useful discipline for prose in its period of groping. Sidney's unfinished *Arcadia* (of which the earlier and relatively plainer version has recently been made accessible), despite its painful forced antitheses, is sprinkled with lovely rhythms, with pleasing formal landscapes, and even with impassioned sentiment and situation, through which the writer's eager and fretted spirit shines. Both these stories, like those of Greene and Lodge, show by their somewhat affected, edited delineation of life and their courtly tone that they were meant in chief for the eyes of ladies, who were excluded alike from the stage and from its audience. Nashe's drastic and photographic tale of masculine life, *Jack Wilton, or The Unfortunate Traveller,* stands almost alone, but some of the gap is filled by the contemporary pamphlets, sometimes vivid, often full of fierce or maudlin declamation, of Nashe himself—by far the most powerful of the group—and of Greene, Dekker and Nicholas Breton. There are also Deloney's vivid pictures of bourgeois life. Thus the English novel was a minor passing form; the leisurely and amorous romance went on in the next century, owing largely to French influence and example.

Critics and Translators.—In criticism, England may almost be counted with the minor Latin countries. Sidney, in his *Defence of Poesy* (1595, written about 1580), and Jonson in his *Discoveries,* offer a well-inspired and lofty restatement of the current answers to the current questions, but could give no account of the actual creative writing of the time. To defend the "truth" of poetry—which was identified with all inventive writing and not only with verse—poetry was saddled with the work of science and instruction. To defend its character it was treated as a delightful but deliberate bait to good behaviour, a theory at best only true of allegory and didactic verse. The real relation of tragedy to spiritual things, which is admittedly shown, however hard its definition, in Shakespeare's plays, no critic for centuries tried to fathom. One of the chief quarrels turned on metric. A few lines that Sidney and Campion wrote on what they thought the system of Latin quantity are really musical. This theory, already raised by Ascham, made a stir, at first in the group of Harvey, Sidney, Dyer and Spenser, called the "Areopagus," an informal attempt to copy the Italian academies; and it was revived on the brink of the reign of James. But Daniel's firm and eloquent *Defence of Rhyming* (1602) was not needed to persuade the poets to continue rhyming in syllabic verse. The stricter view of the nature and classification of poetry, and of the dramatic unity of action, is concisely given, partly by Jonson, partly by Bacon in his *Advancement of Learning* and *De Augmentis;* and Jonson, besides passing his famed judgments on Shakespeare and Bacon, enriched our critical vocabulary from the Roman rhetoricians. Scholastic and sensible manuals, like Webbe's *Discourse of Poetry* and the *Art of English Poesy* (1589), whose authorship is uncertain, come in the rear.

The translators count for more than the critics; the line of their great achievements from Berners' *Froissart* (1523–25) to Urquhart's *Rabelais* (1653) is never broken long; and though their lives are often obscure, their number witnesses to that far-spread diffusion of the talent for English prose, which the wealth of English poetry is apt to hide. The typical craftsman in this field, Philemon Holland, translated Livy, Pliny, Suetonius, Plutarch's *Morals* and Camden's *Britannia,* and his fount of English is of the amplest and purest. North, in his translation, made from Amyot's classic French, of Plutarch's *Lives* (1579), disclosed one of the master-works of old example; Florio, in Montaigne's *Essays* (1603), the charter of the new freedom of mental exploration; and Shelton, in *Don Quixote* (1612), the chief tragi-comic creation of Continental prose. These versions, if by no means accurate in the letter, were adequate in point of soul and style to their great originals; and the English dress of Tacitus (1591), Apuleius, Heliodorus, Commines, *Celestina* and many others, is so good and often so sumptuous a fabric, that no single class of prose authors, from the time of More to that of Dryden, excels the prose translators, unless it be the Anglican preachers. Their matter is given to them, and with it a certain standard of form, so that their natural strength and richness of phrase are controlled without being deadened. But the want of such control is seen in the many pamphleteers, who are the journalists of the time, and are often also playwrights or tale-tellers, divines or politicians. The writings, for instance, of the hectic, satiric and graphic Thomas Nashe, run at one extreme into fiction, and at the other into the virulent rag-sheets of the Marprelate controversy, which is of historical and

social but not of artistic note, being only a fragment of that vast mass of disputatious literature, which now seems grotesque, excitable or dull.

Hooker.—Richard Hooker's *Laws of Ecclesiastical Polity* (1594–97), an accepted defence of the Anglican position against Geneva and Rome, is the first theological work of note in the English tongue, and the first of note since Wycliffe written by an Englishman. It is a plea for reason as one of the safe and lawful guides to the faith; but it also speaks with admirable temper and large feeling to the ceremonial and aesthetic sense. The First Book, the scaffolding of the treatise, discusses the nature of law at large; but Hooker hardly has pure speculative power, and the language had not yet learnt to move easily in abstract trains of thought. In its elaboration of clause and period, in its delicate resonant eloquence, Hooker's style is Ciceronian; but his inversions and mazes of subordinate sentence somewhat rack the genius of English. Later divines like Jeremy Taylor had to disintegrate, since they could not wield, this admirable but over-complex eloquence. The sermons (1621–31) of Donne have the mingled strangeness and intimacy of his verse, and their subtle flame, imaginative tenacity, and hold upon the springs of awe make them unique. Though without artificial symmetry, their sentences are intricately harmonized, in strong contrast to such pellet-like clauses as those of the learned Lancelot Andrewes, who was Donne's younger contemporary and the subject of Milton's Latin epitaph.

Bacon.—With Francis Bacon (1561–1626) English philosophy began its unbroken course and took its long-delayed rank in Europe. His prose, of which he is the first high and various master in English, was shaped and coloured by his bent as orator and pleader, by his immixture in affairs, by his speculative brain, and by his use and estimate of Latin. In his conscious craftsmanship, his intellectual confidence and curiosity, his divining faith in the future of science, and his resolve to follow the leadings of nature and experience unswervingly; in his habit of storing and using up his experience, and in his wide worldly insight, crystallized in maxim, he suggests a kind of Goethe, without the poetic hand or the capacity for love and lofty suffering. He saw all nature in a map, and wished to understand and control her by outwitting the "idols," or inherent paralysing frailties of the human judgment. He planned but could not finish a great cycle of books in order to realize this conception. The *De Augmentis Scientiarum* (1623) expanded from the English *Advancement of Knowledge* (1605) draws the map; the *Novum Organum* (1620) sets out the errors of scholasticism and the methods of inductive logic; the *New Atlantis* sketches an ideally equipped and moralized scientific community. Bacon shared with the great minds of his century the notion that Latin would outlast any vernacular tongue, and committed his chief scientific writings to a Latin which is alive and splendid and his own, and which also disciplined and ennobled his English. The *Essays* (1597, 1612, 1625) are his lifelong, gradually accumulated diary of his opinions on human life and business. These famous compositions are often sadly mechanical. They are chippings and basketings of maxims and quotations, and of anecdotes, often classical, put together inductively, or rather by "simple enumeration" of the pros and cons. Still they are the honest notes of a practical observer and statesman, disenchanted—why not?—with mankind, concerned with cause and effect rather than with right and wrong, wanting the finer faith and insight into men and women, but full of reality, touched with melancholy, and redeeming some arid, small and pretentious counsels by many that are large and wise. Though sometimes betraying the workshop, Bacon's style, at its best, is infallibly expressive; like Milton's angels, it is "dilated or condensed" according to its purposes. In youth and age alike, Bacon commanded the most opposite patterns and extremes of prose—the curt maxim, balanced in antithesis or triplet, or standing solitary; the sumptuous, satisfying and brocaded period; the movements of exposition, oratory, pleading and narrative. The *History of Henry VII.* (1622), written after his fall from office, is in form as well as insight and mastery of material the one historical classic in English before Clarendon. Bacon's musical sense for the value and placing of splendid words and proper names resembles Marlowe's. But the master of mid-Renaissance prose is Shakespeare; with him it becomes the voice of finer and more impassioned spirits than Bacon's—the voice of Rosalind and Hamlet. And the eulogist of both men, Ben Jonson, must be named in their company for his senatorial weight and dignity of ethical counsel and critical maxim.

Hobbes and Browne.—As the Stuart rule declined and fell, prose became enriched from five chief sources: from philosophy, whether formal or unmethodical; from theology and preaching and political dispute; from the poetical contemplation of death; from the observation of men and manners; and from antiquarian scholarship and history. As in France, where the first three of these kinds of writings flourished, it was a time rather of individual great writers than of any admitted pattern or common ideal of prose form, although in France this pattern was always more clearly defined. The mental energy, meditative depth, and throbbing brilliant colour of the English drama passed with its decay over into prose. But Latin was still often the supplanter: the treatise of Lord Herbert of Cherbury, *De Veritate*, of note in the early history of Deism, and much of the writing of the ambidextrous Thomas Hobbes, are in Latin. In this way Latin disciplined English once more, though it often tempted men of genius away from English. The *Leviathan* (1651) with its companion books on *Human Nature* and *Liberty*, and Hobbes' explosive dialogue on the civil wars, *Behemoth* (1679), have the bitter concision of Tacitus and the clearness of a half-relief in bronze. Hobbes' speculations on the human animal, the social contract, the absolute power of the sovereign, and the subservience owed to the sovereign by the church or "Kingdom of Darkness," enraged all parties, and left their trace on the thought and controversial literature of the century. With Ben Jonson and the jurist Selden (whose English can be judged from his *Table Talk*), Hobbes anticipates the brief and clear sentence-structure of the next age, though not its social ease and amenity of form. But his grandeur is not that of a poet, and the poetical prose is the most distinctive kind of this period. It is eloquent above all on death and the vanity of human affairs; its solemn tenor prolongs the reflections of Claudio, of Fletcher's Philaster, or of Spenser's Despair. It is exemplified in Bacon's Essay *Of Death*, in the anonymous descant on the same subject once wrongly ascribed to him, in Donne's plea for suicide, in Raleigh's *History of the World*, in Drummond's *Cypress Grove* (1623), in Jeremy Taylor's sermons and *Holy Dying* (1651), and in Sir Thomas Browne's *Urn-Burial* (1658) and *Letter to a Friend*. Its usual vesture is a long purple period, freely Latinized, though Browne equally commands the form of solemn and monumental epigram. He is also free from the dejection that wraps round the other writers on the subject, and a holy quaintness and gusto relieve his ruminations. The *Religio Medici* (1642), quintessentially learned, wise and splendid, is the fullest memorial of his power. Amongst modern prose writers, De Quincey is his only true rival in musical sensibility to words.

Taylor and Burton.—Jeremy Taylor, the last great English casuist and schoolman, and one of the first pleaders for religious tolerance (in his *Liberty of Prophesying*, 1647), is above all a preacher; tender, intricate, copious, inexhaustible in image and picturesque quotation. From the classics, from the East, from the animal world, from the life of men and children, his illustrations flow, without end or measure. He is a master of the lingering cadence, which soars upward and onward on its coupled clauses, as on balanced iridescent wings, and is found long after in his scholar Ruskin. Imaginative force of another kind pervades Robert Burton's *Anatomy of Melancholy* (1621), where the humorous medium refracts and colours every ray of the recluse's far-travelled spirit. The mass of Latin citation, woven, not quilted, into Burton's style, is another proof of the vitality of the cosmopolitan language. Burton and Browne owe much to the pre-critical learning of their time, which yields up such precious savours to their fancy, that we may be thankful for the delay of more precise science and scholarship. Fancy, too, of a suddener and wittier sort, preserves some of the ample labours of Thomas Fuller, which are scattered over the years 1631–62; and the *Lives* and *Compleat Angler* (1653) of Izaak Walton are unspoilt, happy or pious pieces

of idyllic prose. No adequate note on the secular or sacred learning of the time can here be given; on Camden, with his vast erudition, historical, antiquarian and comparatively critical (*Britannia,* in Latin, 1586); or on Ussher, with his patristic and chronological learning, one of the many *savants* of the Anglican church. Other divines of the same camp pleaded, in a plainer style than Taylor, for freedom of personal judgment and against the multiplying of "vitals in religion"; the chief were Chillingworth, one of the ablest of English apologists, in his *Religion of Protestants* (1638), and John Hales of Eton. The Platonists, or rather Plotinists, of Cambridge, who form a curious digression in the history of modern philosophy, produced two writers, John Smith and Henry More, of an exalted and esoteric prose, more directly inspired by Greece than any other of the time; and their champion of erudition, Cudworth, in his *True Intellectual System,* gave some form to their doctrine.

Clarendon and Milton.—Above the vast body of pamphlets and disputatious writing that form the historian's material stands Edward Hyde, earl of Clarendon's *History of the Rebellion,* printed in 1702–04, 30 years after his death. Historical writing hitherto, but for Bacon's *Henry VII.*, had been tentative though profuse. Raleigh's vast disquisition upon all things, *The History of the World* (1614), survives by passages and poetic splendours; gallantly written second-hand works like Knolles's *History of the Turks,* and the rhetorical *History of the Long Parliament* by May, had failed to give England rank with France and Italy. Clarendon's book, one of the greatest memoirs and most vivid of portrait-galleries, spiritually unappreciative of the other side, but full of a subtle discrimination of character and political motive, brings its author into line with Retz and Saint-Simon, the watchers and recorders and sometimes the makers of contemporary history. Clarendon's *Life,* above all the picture of Falkland and his friends, is a personal record of the delightful sort in which England was thus far infertile. He is the last old master of prose, using and sustaining the long, sinuous sentence, unworkable in weaker hands. He is the last, for Milton's polemic prose, hurled from the opposite camp, was written between 1643 and 1660. Whether reviling bishops or royal privilege or indissoluble monogamy, or recalling his own youth and aims; or claiming liberty for print in *Areopagitica* (1644); in his demonic defiances, or angelic calls to arms, or his animal eruptions of spite and hatred, Milton leaves us with a sense of the motive energies that were to be transformed into *Paradise Lost* and *Samson.* His sentences are ungainly and often inharmonious, but often irresistible; he rigidly withstood the tendencies of form, in prose as in verse, that Dryden was to represent, and thus was true to his own literary dynasty.

The Authorized Version.—A special outlying position belongs to the Authorized Version (1611) of the Bible, the late fruit of the long toil that had begun with Tyndale's, and, on the side of style, with the Wycliffite translations. More scholarly than all the preceding versions which it utilized, it won its incomparable form, not so much because of the "grand style that was in the air," which would have been the worst of models, as because the style had been already tested and ennobled by generations of translators. Its effect on poetry and letters was for some time far smaller than its effect on the national life at large, but it was the greatest translation—being of a whole literature, or rather of two literatures—in an age of great translations.

Characters.—Other forms soften the transition to Restoration prose. The vast catalogue of Characters numbers hundreds of titles. Deriving from Theophrastus, who was edited by Casaubon in 1592, they are yet another Renaissance form that England shared with France. But in English hands, failing a La Bruyère —in Hall's, in Overbury's, even in those of the gay and skilful Earle (*Microcosmographie,* 1628)—the Character is a mere list of the attributes and oddities of a type or calling. It is to the Jonsonian drama of humours what the *pensée* or detached remark, practised by Bishop Hall and later by Butler and Halifax, is to the essay. These works tended long to be commonplace or didactic, as the popular *Resolves* of Owen Feltham shows. Cowley was the first essayist to come down from the desk and talk as to his equals in easy phrases of middle length. A time of dissension was not the best for this kind of peaceful, detached writing. The letters of James Howell, the autobiography of Lord Herbert of Cherbury, and the memoirs of Kenelm Digby belong rather to the older and more mannered than to the more modern form, though Howell's English is in the plainer and quicker movement.

IV. RESTORATION PERIOD

French Influence.—The Renaissance of letters in England entered on a fresh and peculiar phase in the third quarter of the century. The balance of intellectual and artistic power in Europe had completely shifted since 1580. Inspiration had died down in Italy, and its older classics were no longer a stimulus. The Spanish drama had flourished, but its influence though real was scattered and indirect. The Germanic countries were slowly emerging into literature; England they scarcely touched. But the literary empire of France began to declare itself both in Northern and Southern lands, and within half a century was assured. Under this empire the English genius partly fell, though it soon asserted its own equality, and by 1720 had so reacted upon France as more than to repay the debt. Thus between 1660 and 1700 is prepared a temporary dual control of European letters. But in Dryden's age France gave England more than she received; she gave more than she had ever given since the age of Chaucer. During Charles II.'s days Racine, Molière, La Fontaine and Bossuet ran the best of their course. Cavalier exiles like Waller, Cowley and Hobbes had come back from the winter of their discontent in Paris, and Saint-Evremond, the typical *bel esprit* and critic, settled long in England. A vast body of translations from the French is recounted, including latterly the works of the Protestant refugees printed in the free Low Countries or in England. Naturally this influence told most strongly on the social forms of verse and prose—upon comedy and satire, upon criticism and maxim and epigram, while it also affected theology and thought. And this meant the Renaissance once more, still unexhausted, only working less immediately and in fresh if narrower channels. Greek literature, Plato and Homer and the dramatists, became dimmer; the secondary forms of Latin poetry came to the fore, especially those of Juvenal and the satirists, and the *pedestris sermo,* epistolary and critical, of Horace. These had some direct influence, as Dryden's translation of them, accompanying his Virgil and Lucretius, may show. But they came commended by Boileau, their chief modernizer, and in their train was the fashion of gallant, epigrammatic and social verse. The tragedy of Corneille and Racine, developed originally from the Senecan drama, contended with the traditions of Shakespeare and Fletcher, and was reinforced by that of the correcter Jonson, in shaping the new theatre of England. The French codifiers, who were often also the distorters, of Aristotle's *Poetics* and Horace's *Ars poetica,* furnished a canonical body of criticism on the epic and the drama, to which Dryden is half a disciple and half a rebel. All this implied at once a loss of the larger and fuller inspirations of poetry, a decadence in its great and primary forms, epic, lyric and tragic, and a disposition, in default of such creative power, to turn and take stock of past production. In England, therefore, it is the age of secondary verse and of nascent, often searching criticism.

Rise of Science.—The same critical spirit was also whetted in the fields of science and speculation, which the war and the Puritan rule had not encouraged. The activities of the newly-founded Royal Society told directly upon literature, and counted powerfully in the organization of a clear, uniform prose—the "close, naked, natural way of speaking," which the historian of the Society, Sprat, cites as part of its programme. And the style of Sprat, as of scientific masters like Newton and Ray the botanist, itself attests the change. A time of profound and peaceful and fruitful scientific labour began; the whole of Newton's *Principia* appeared in 1687; the dream of Bacon came nearer, and England was less isolated from the international work of knowledge. The spirit of method and observation and induction spread over the whole field of thought and was typified in John Locke, whose *Essay concerning Human Understanding* came out in English in 1690, and who applied the same deeply sagacious

and cautious calculus to education and religion and the "conduct of the understanding." But his works, though their often mellow and dignified style has been ignorantly underrated, also show the change in philosophic writing since Hobbes. The old grandeur and pugnacity are gone; the imaginative play of science, or quasi-science, on the literature of reflection is gone; the eccentrics, the fantasts, the dreamers are gone, or only survive in curious transitional writers like Joseph Glanvil (*Scepsis scientifica,* 1665) or Thomas Burnet (*Sacred Theory of the Earth,* 1684). This change was in part a conscious and an angry change, as is clear from the attacks made in Samuel Butler's *Hudibras* (1663–68) upon scholastic verbiage, astrology, fanatical sects and their disputes, upon poetic "heroic" enthusiasm and intellectual whim.

Before the Restoration men of letters, with signal exceptions like Milton and Marvell, had been Cavalier, courtly and Anglican in their sympathies. The Civil War had scattered them away from the capital, which, despite Milton's dream in *Areopagitica* of its humming and surging energies, had ceased to be, what it now again became, the natural haunt and Rialto of authors. The taste of the new king and court served to rally them. Charles II. relished *Hudibras,* used and pensioned Dryden, sat under Barrow and South and heard them with appreciation, countenanced science, visited comedies, and held his own in talk by mother-wit. Letters became the pastime, and therefore one of the more serious pursuits, of men of quality, who soon excelled in song and light scarifying verse and comedy, and took their own tragedies and criticisms gravely. Poetry under such auspices became gallant and social, and also personal and partisan; and satire was soon its most vital form, with the accessories of compliment, rhymed popular argumentation and elegy. The social and conversational instinct was the master-influence in prose. It produced a subtle but fundamental change in the attitude of author to reader. Prose came nearer to living speech, it became more civil and natural and persuasive, and this not least in the pulpit. The sense of ennui, or boredom, which seemed unknown in the earlier part of the century, became strongly developed, and prose was much improved by the fear of provoking it. In all these ways the Restoration accompanied and quickened a speedier and greater change in letters than any political event in English history since the reign of Alfred, when prose itself was created.

Prose and Criticism.—The formal change in prose can thus be assigned to no one writer, for the good reason that it presupposes a change of spoken style lying deeper than any personal influence. If we begin with the writing that is nearest living talk—the letters of Otway or Lady Rachel Russell, or the diary of Pepys (1659–69)—that supreme disclosure of our mother-earth —or the evidence in a State trial, or the dialogue in the more natural comedies; if we then work upwards through some of the plainer kinds of authorship, like the less slangy of L'Estrange's pamphlets, or Burnet's *History of My Own Time,* a solid Whig memoir of historical value, until we reach really admirable or lasting prose like Dryden's *Preface* to his *Fables* (1700), or the maxims of Halifax;—if we do this, we are aware, amid all varieties, survivals and reversions, of a strong and rapid drift towards the style that we call modern. And one sign of this movement is the revulsion against any over-saturating of the working, daily language, and even of the language of appeal and eloquence, with the Latin element. In Barrow and Glanvil, descendants of Taylor and Browne, many Latinized words remain, which were soon expelled from style like foreign bodies from an organism. As in the mid-16th and the mid-18th century, the process is visible by which the Latin vocabulary and Latin complication of sentence first gathers strength, and then, though not without leaving its traces, is forced to ebb. The instinct of the best writers secured this result, and secured it for good and all. In Dryden's diction there is a nearly perfect balance and harmony of learned and native constituents, and a sensitive tact in Gallicizing; in his build of sentence there is the same balance between curtness or bareness and complexity or ungainly lengthiness. For ceremony and compliment he keeps a rolling period, for invective a short sharp stroke without the gloves. And he not only uses in general a sentence of moderate scale, inclining to brevity, but he finds out its harmonies; he is a seeming-careless but an absolute master of rhythm. In delusive ease he is unexcelled; and we only regret that he could not have written prose oftener instead of plays. We should thus, however, have lost their prefaces, in which the bulk and the best of Dryden's criticisms appear. From the *Essay of Dramatic Poesy* (1668) down to the *Preface to Fables* (1700) runs a series of essays: *On the Grounds of Criticism in Tragedy, On Heroic Plays, On Translated Verse, On Satire* and many more; which form the first connected body of criticisms in the language, and are nobly written always. Dryden's prose is literature as it stands, and yet is talk, and yet again is mysteriously better than talk. The critical writings of John Dennis are but a sincere application of the rules and canons that were now becoming conventional; Rymer, though not so despicable as Macaulay said, is still more depressing than Dennis; and for any critic at once so free, so generous and so sure as Dryden we wait in vain for a century.

Three or four names are usually associated with Dryden's in the work of reforming or modifying prose: Sprat, Tillotson, Sir William Temple, and George Savile, marquis of Halifax; but the honours rest with Halifax. Sprat, though clear and easy, has little range; Tillotson, though lucid, orderly, and a very popular preacher, has little distinction; Temple, the elegant essayist, has a kind of barren gloss and fine literary manners, but very little to say. The political tracts, essays and maxims of Halifax are the most typically modern prose between Dryden and Swift, and are nearer than anything else to the best French writing of the same order, in their finality of epigram, their neatness and mannerliness and sharpness. The *Character of a Trimmer* and *Advice to a Daughter* are the best examples.

Religious Literature, Anglican and Puritan, is the chief remaining department to be named. The strong, eloquent and coloured preaching of Isaac Barrow, the mathematician, who died in 1677, is a survival of the larger and older manner of the church. In its balance of logic, learning and emotion, in its command alike of Latin splendour and native force, it deserves a recognition it has lost. Another athlete of the pulpit, Robert South, who is so often praised for his wit that his force is forgotten, continues the lineage, while Tillotson and the elder Sherlock show the tendency to the smoother and more level prose. But the revulsion against strangeness and fancy and magnificence went too far; it made for a temporary bareness and meanness and disharmony, which had to be checked by Addison, Bolingbroke and Berkeley. From what Addison saved our daily written English, may be seen in the vigorous slangy hackwork of Roger L'Estrange, the translator and pamphleteer, in the news-sheets of Dunton, and in the satires of Tom Brown. These writers were debasing the coinage with their street journalism.

Another and far nobler variety of vernacular prose is found in the Puritans. Baxter and Howe, Fox and Bunyan, had the English Bible behind them, which gave them the best of their inspiration, though the first two of them were also erudite men. Richard Baxter, an immensely fertile writer, is best remembered by those of his own fold for his *Saint's Everlasting Rest* (1650) and his autobiography, John Howe for his evangelical apologia *The Living Temple of God* (1675), Fox for his *Journal* and its mixture of quaintness and rapturous mysticism. John Bunyan, the least instructed of them all, is their only born artist. His creed and point of view were those of half the nation—the half that was usually inarticulate in literature, or spoke without style or genius. His reading, consisting not only of the Bible, but of the popular allegories of giants, pilgrims and adventure, was also that of his class. *The Pilgrim's Progress,* of which the first part appeared in 1678, the second in 1684, is the happy flowering sport amidst a growth of barren plants of the same tribe. The *Progess* is a dream, more vivid to its author than most men's waking memories to themselves; the emblem and the thing signified are merged at every point, so that Christian's journey is not so much an allegory with a key as a spiritual vision of this earth and our neighbours. *Grace Abounding,* Bunyan's diary of his own voyage to salvation, *The Holy War,* an overloaded fable of the fall and recovery of mankind, and *The Life and*

Death of Mr. Badman, a novel telling of the triumphal earthly progress of a scoundrelly tradesman, are among Bunyan's other contributions to literature. His union of spiritual intensity, sharp humorous vision, and power of simple speech consummately chosen, mark his work off alike from his own inarticulate public and from all other literary performance of his time.

Transitional Verse.—The transition from the older to the newer poetry was not abrupt. Old themes and tunes were slowly disused, others previously of lesser mark rose into favour, and a few quite fresh ones were introduced. The poems of John Oldham and Andrew Marvell belong to both periods. Both of them begin with fantasy and elegy, and end with satires, which indeed are rather documents than works of art. The monody of Oldham on his friend Morwent is poorly exchanged for the *Satires on the Jesuits* (1681), and the lovely metaphysical verses of Marvell on gardens and orchards and the spiritual love sadly give place to his *Last Instructions to a Painter* (1669). In his *Horatian Ode* Marvell had nobly and impartially applied his earlier style to national affairs; but the time proved too strong for this delightful poet. Another and a stranger satire had soon greeted the Restoration, the *Hudibras* (1663–78) of Samuel Butler, with its companion pieces. The returned wanderers delighted in this horribly agile, boisterous and fierce attack on the popular party and its religions, and its wrangles and its manners. Profoundly eccentric and tiresomely allusive in his form, and working in the short rhyming couplets thenceforth called "Hudibrastics," Butler founded a small and peculiar but long-lived school of satire. The other verse of the time is largely satire of a different tone and metre; but the earlier kind of finished and gallant lyric persisted through the reign of Charles II. The songs of John Wilmot, earl of Rochester, are usually malicious, sometimes passionate; they have a music and a splendid self-abandonment such as we never meet again till Burns. Sedley and Dorset and Aphra Behn and Dryden are the rightful heirs of Carew and Lovelace, those infallible masters of short rhythms; and this secret also was lost for a century afterwards.

Dryden.—In poetry, in prose, and to some extent in drama, John Dryden, the creature of his time, is the master of its expression. He began with panegyric verse, first on Cromwell and then on Charles, which is full of fine things and false writing. The *Annus Mirabilis* (1667) is the chief example, celebrating the Plague, the Fire and the naval victory, in the quatrains for which Davenant's pompous *Gondibert* had shown the way. The *Essay on Dramatic Poesy* (1668), a dialogue on the rivalries of blank verse with rhyme, and of the Elizabethan drama with the French, is perfect modern prose; and to this perfection Dryden attained at a bound, while he attained his poetical style more gradually. He practised his couplet in panegyric, in heroic tragedy, and in dramatic prologue and epilogue for 20 years before it was consummate. Till 1680 he supported himself chiefly by his plays, which have not lived so long as their critical prefaces, already mentioned. His diction and versification came to their full power in his satires, rhymed arguments, dedications and translations. *Absalom and Achitophel* (part 1, 1681; part 2, with Nahum Tate, 1682), as well as *The Medal* and *Mac Flecknoe,* marked a new birth of English satire, placing it at once on a level with that of any ancient or modern country. The mixture of deadly good temper, Olympian unfairness, and rhetorical and metrical skill in each of these poems has never been repeated. The presentment of Achitophel, earl of Shaftesbury, in his relations with Absalom Walters and Charles the minstrel-king of Judah, as well as the portraits of Shimei and Barzillai and Jotham, the eminent Whigs and Tories, and of the poets Og and Doeg, are things whose vividness age has never discoloured. Dryden's Protestant arguings in *Religio Laici* (1682) and his equally sincere Papistical arguings in *The Hind and the Panther* (1687) are just as skilful. His translations of Virgil and parts of Lucretius, of Chaucer and Boccaccio (*Fables*, 1700), set the seal on his command of his favourite couplet for the higher kinds of appeal and oratory. His *Ode* on Anne Killigrew, and his popular but coarser *Alexander's Feast,* have a more lyric harmony; and his songs, inserted in his plays, reflect the change of fashion by their metrical adeptness and often thoroughgoing wantonness. The epithet of "glorious," in its older sense of a certain conscious and warranted pride of place, not in that of boastful or pretentious, suits Dryden well. Not only did he leave a model and a point of departure for Pope, but his influence recurs in Churchill, in Gray, in Johnson and in Crabbe, where he is seen counteracting, with his large, wholesome and sincere bluntness, the acidity of Pope. Dryden was counted near Shakespeare and Milton until the romantic revival renewed the sense of proportion; but the same sense now demands his acknowledgment as the English poet who is nearest to their frontiers of all those who are exiled from their kingdom.

Restoration Drama.—Restoration and Revolution tragedy is nearly all abortive; it is now hard to read it for pleasure. But it has lofty flights, and its historic interest is high. Two of its species, the rhymed heroic play and the rehandling of Shakespeare in blank verse, were also brought to their utmost by Dryden, though in both he had many companions. The heroic tragedies were a hybrid offspring of the heroic romance and French tragedy; and though *The Conquest of Granada* (1669–70) and *Tyrannic Love* would be very open to satire in Dryden's own vein, they are at least generously absurd. Their intention is never ignoble, if often impossible. After a time Dryden went back to Shakespeare, after a fashion already set by Sir William Davenant, the connecting link with the older tragedy and the inaugurator of the new. They "revived" Shakespeare; they vamped him in a style that did not wholly perish till after the time of Garrick. *The Tempest, Troilus and Cressida,* and *Antony and Cleopatra* were thus handled by Dryden; and the last of these, as converted by him into *All for Love* (1678) is loftier and stronger than any of his original plays, its blank verse renewing the ties of Restoration poetry with the great age. The heroic plays, written in one or other metre, lived long, and expired in the burlesques of Fielding and Sheridan. *The Rehearsal* (1671), a gracious piece of fooling partly aimed at Dryden by Buckingham and his friends, did not suffice to kill its victims. Thomas Otway and Nathaniel Lee, both of whom generally used blank verse, are the other tragic writers of note, children indeed of the extreme old age of the drama. Otway's long-acted *Venice Preserved* (1682) has an almost Shakespearian skill in melodrama, a wonderful tide of passionate language, and a blunt and bold delineation of character; but Otway's inferior style and verse could only be admired in an age like his own. Lee is far more of a poet, though less of a dramatist, and he wasted a certain talent in noise and fury.

Restoration comedy at first followed Jonson, whom it was easy to try and imitate; Shadwell and Wilson, whose works are a museum for the social antiquary, photographed the humours of the town. Dryden's many comedies often show his more boisterous and blatant, rarely his finer qualities. Like all playwrights of the time he pillages from the French, and vulgarizes Molière without stint or shame. A truer light comedy began with Sir George Etherege, who mirrored in his fops the gaiety and insolence of the world he knew. The society depicted by William Wycherley, the one comic dramatist of power between Massinger and Congreve, at first seems hardly human; but his energy is skilful and faithful as well as brutal; he excels in the graphic reckless exhibition of outward humours and bustle; he scavenges in the most callous good spirits and with careful cynicism. *The Plain Dealer* (1677), a skilful transplantation, as well as a depravation of Molière's *Le Misanthrope,* is his best piece: he writes in prose, and his prose is excellent, modern and lifelike.

V. THE 18TH CENTURY

In the reign of Anne (1702–14) the social changes which had begun with the Restoration of 1660 made themselves definitely felt. Books began to penetrate among all classes of society. The period is consequently one of differentiation and expansion. As the practice of reading becomes more and more universal, English writers lose much of their old idiosyncrasy, intensity and obscurity. As in politics and religion, so in letters, there is a great development of nationality. Commercial considerations too for the first time become important. Provincial feeling exercises a diminishing sway, and literature becomes increasingly metropolitan or suburban. With the multiplication of moulds, the refinement of prose polish, and the development of breadth, variety and ease, it was natural enough, having regard to the part that the country played in the world's affairs, that English literature should make its début in western Europe. The strong national savour seemed to stimulate the foreign appetite, and as represented by Swift, Pope, Defoe, Young, Goldsmith, Richardson, Sterne and Ossian, if we exclude Byron and Scott, the 18th century may be deemed the cosmopolitan age, *par excellence*, of English Letters.

It is pre-eminently an age of prose, and although verbal expression is seldom represented at its highest power, we shall find nearly every variety of English prose brilliantly illustrated during this period: the aristocratic style of Bolingbroke, Addison and Berkeley; the gentlemanly style of Fielding; the keen and logical controversy of Butler, Middleton, Smith and Bentham; the rhythmic and balanced if occasionally involved style of Johnson and his admirers; the limpid and flowing manner of Hume and Mackintosh; the light, easy and witty flow of Walpole; the divine chit-chat of Cowper; the colour of Gray and Berkeley; the organ roll of Burke; the lucid realism of Swift and Defoe, the sly familiarity of Sterne; the dance music and wax candles of Sheridan; the stateliness of Gibbon; the air and ripple of Goldsmith; the dramatic dialogue of Boswell—these and other characteristics can be illustrated in 18th-century prose as probably nowhere else.

Addison, Swift and Defoe.—At the outset of the new century the two chief architects of public opinion were John Locke and Joseph Addison. When he died at High Laver in Oct. 1704 at the age of 72, Locke had, perhaps, done more than any man of the previous century to prepare the way for the new era. Social duty and social responsibility were his two watchwords. The key to both he discerned in the *Human Understanding*—"no province of knowledge can be regarded as independent of reason." But the great modernist of the time was Joseph Addison (1672–1719). It was he who first left the 17th century, with its formal obsequiousness, definitely behind. He did for English culture what Rambouillet did for that of France, and it is hardly an exaggeration to call the half-century before the great fame of the English novel, the half century of the *Spectator*.

Addison's mind was fertilized by intercourse with the more original genius of Swift and with the more inventive mind of Steele. It was Richard Steele (1672–1729) in the *Tatler* of 1709–10 who first realized that the specific which that urbane age both needed and desired was no longer copious preaching and rigorous declamation, but little doses of good sense, good taste and good-humoured morality, disguised beneath an easy and fashionable style. Nothing could have suited Addison better than the opportunity afforded him of contributing an occasional essay or roundabout paper in praise of virtue or dispraise of stupidity and bad form to his friend's periodical. When the *Spectator* succeeded the *Tatler* in March 1711, Addison took a more active share in shaping the chief characters (with the immortal baronet, Sir Roger, at their head) who were to make up the "Spectator club"; and, better even than before, he saw his way, perhaps, to reinforcing his copious friend with his own more frugal but more refined endowment. Such a privileged talent came into play at precisely the right moment to circulate through the coffee houses and to convey a large measure of French ease and elegance into the texture of English prose. Addison became a personage of the utmost consideration, and the essay as he left it became an almost indispensable accomplishment to the complete gentlemen of that age.

The other side, both in life and politics, was taken by Jonathan Swift (1667–1745), who preferred to represent man on his unsocial side. He sneered at most things, but not at his own order, and he came to defend the church and the country squirearchy against the conventicle and Capel court. To undermine the complacent entrenchments of the Whig capitalists at war with France no sap proved so effectual as his pen. Literary influence was then exercised in politics mainly by pamphlets, and Swift was the greatest of pamphleteers. In the *Journal to Stella* he has left us a portrait of himself in turn currying favour, spoiled, petted and humiliated by the party leaders of the Tories from 1710–13. He had always been bitter in his satire, and when the Hanoverians came in and he was treated as a suspect, he showed the very genius of savagery in his mockery of all mankind (*Gulliver's Travels*, 1726). In wit, logic, energy, pith, sardonic playfulness, resourcefulness and Saxon simplicity, his prose has never been equalled. The choicest English then, it is the choicest English still. Dr. John Arbuthnot (1667–1735) may be described as an understudy of Swift on the whimsical side only, whose malignity, in a nature otherwise most kindly, was circumscribed strictly by the limits of political persiflage. Bernard Mandeville (1670–1733), unorthodox as he was in every respect, discovered a little of Swift's pessimism in his assault (in *The Fable of the Bees* of 1723) on the genteel optimism of the *Characteristics* of Lord Shaftesbury. Neither the matter nor the manner of the brilliant Tory chieftain Henry St. John, Viscount Bolingbroke (1678–1751), appears to us now as being of the highest significance; but, although Bolingbroke's ideas were second-hand, his work has historical importance. His essays on "History" and on "a Patriot King" both disturb a soil well prepared, and set up a reaction against such evil tendencies as a narrowing conception of history and a factious and partisan conception of politics.

The new trade of writing was represented most perfectly by Daniel Defoe (1660–1731). From reporting sensations and chronicling *faits divers*, Defoe worked his way almost insensibly to the Spanish tale of the picaresque pattern. *Robinson Crusoe* was a true story expanded on these lines, and written under stress of circumstance when its author was just upon 60. What Defoe excelled in was plain, straightforward story-telling, in understanding and appraising the curiosity of the ordinary man, and in possessing just the literary stroke that would enable him most effectually to satisfy it. He was the first and cleverest of all descriptive reporters, for he knew better than any successor how and where to throw in those details which give an air of verisimilitude to a narrative—the little naïvetés as of a plain man who is not telling a tale for effect, but striving after his own manner to give the plain unvarnished truth. Defoe contributes story, Addison character, Fielding the life-atmosphere, Richardson and Sterne the sentiment, and we have the 18th-century novel complete.

Poetry.—To the passion and imagination essential to the most inspired kinds of poetry Alexander Pope (1688–1744) can lay small claim, even in his best work like the *Satires* and *Epistles*. Yet in lucid, terse and pungent phrase, and in mastery of his metrical instrument, he has rarely if ever been surpassed. His classical fancy, his elegant turn for periphrasis and his venomous sting alike made him the idol of that urbane age. His style was the apotheosis of wit, point, lucidity and technical correctness. Pope was the first Englishman to make poetry pay (apart from

patronage). He was flattered by imitation to an extent which threatened to throw the school of poetry which he represented into permanent discredit. The second-rate wore his badge. But although the cult of Pope was the established religion of poetic taste from 1714 to 1798, there were always nonconformists. The poetic revolt, indeed, was far more versatile than the religious revival of the century. The *Winter* (1726) of James Thomson may be regarded as inaugurating a new era in English poetry. Lady Winchilsea, John Philips, author of *Cyder*, and John Dyer, whose *Grongar Hill* was published a few months before *Winter*, had pleaded by their work for a truthful and unaffected, and at the same time a romantic treatment of nature in poetry; but the ideal of artificiality and of a frigid poetic diction by which English poetry had been dominated since the days of Waller and Cowley was first effectively challenged by Thomson. At the time when the Popean couplet was at the height of its vogue he deliberately put it aside in favour of blank verse. And he it was who transmitted the sentiment of natural beauty not merely to imitators, but also to Collins, to Gray and to Cowper, and so indirectly to the lyrical bards of 1798. By the same hands and those of Shenstone experiments were being made in the stanza of *The Faerie Queene;* a little later, through Bishop Percy, the cultivation of the old English and Scottish ballad literature became popular. Dissatisfaction with the limitations of "Augustan" poetry was similarly responsible for the revived interest in Shakespeare and Chaucer.

To pretend then that the poetic heart of the 18th century was Popean to the core would be extravagant. There were a number of poets in the second and third quarters of the century who strove to reinstate imagination upon its throne, and to substitute the singing voice for the rhetorical recitative of the heroic couplet. Within two years of the death of Pope, in 1746, William Collins was content to *sing* (not say) what he had in him. A more important if less original figure in that movement was Thomas Gray, a man of the widest curiosities of his time, in whom every attribute of the poet to which scholarship, taste and refinement are contributory may be found to the full, but in whom the strong creative energy is deficient—despite the fact that he wrote a string of "divine truisms" in his *Elegy*, which has given to multitudes more of the exquisite pleasure of poetry than any other single piece in the English language. The imaginative originality of Christopher Smart's *Song to David,* written in Bedlam, has won slower but authoritative recognition. Shenstone and Percy, Capell, the Wartons and eventually Chatterton, continued to mine in the shafts which Gray had been the first to sink.

The Novel.—The development of the individual and of a well-to-do urban middle class, which was rapidly multiplying its area of leisure, brought into existence a curious and self-conscious society, hungry for pleasure and new sensations, anxious to be told about themselves, willing in some cases even to learn civilization from their betters. The disrepute into which the drama had fallen since Jeremy Collier's attack on it directed this society by an almost inevitable course into the flowery paths of fiction. The De Coverley papers in the *Spectator* want nothing but a love-thread to convert them into a serial novel of a high order. The supreme importance of the sentimental interest had already been discovered in France by Madame de la Fayette, the Marquise de Tencin, Marivaux and the Abbé Prevost. Samuel Richardson (1689–1762), therefore, when he produced the first two modern novels of European fame in *Pamela* (1740) and *Clarissa* (1748), inherited far more than he invented. There had been Richardsonians before Richardson. *Pamela* is nevertheless a pioneer work in its adroit use of the epistolary method and in its revelation of the latent romance in the outwardly commonplace life of a maid-servant. In *Clarissa* Richardson rises to a greater height as an anatomist of the female heart and creates in his heroine one of the master-figures of literature. The long drawn out English novel of love analysis and moral sentiment (as opposed to the romance of adventure) has in Richardson its first successful charioteer.

The novel in England gained prodigiously by the shock of opposition between the ideals of Richardson and Henry Fielding (1707–54), his rival and parodist. Fielding is, to be brief, the antithesis of Richardson, and represents the opposite pole of English character. He is the Cavalier, Richardson the Roundhead; he is the gentleman, Richardson the tradesman; he represents church and county, Richardson chapel and borough. There was no poetry in Fielding; but there was practically every other ingredient of a great prose writer—taste, culture, order, vivacity, humour, penetrating irony and vivid, pervading common sense and it is Fielding's masterpiece *Tom Jones* (1749) that we must regard if not as the fundament at least as the head of the corner in English prose fiction. Before *Tom Jones* appeared, the success of the novel had drawn a new competitor into the field in Tobias Smollett, the descendant of a good western lowland family who had knocked about the world and seen more of its hurlyburly than Fielding himself. The genius which struggles through novels such as *Roderick Random* and *Ferdinand Count Fathom* was nearly submerged under the hard conditions of a general writer during the third quarter of the 18th century, and it speaks volumes for Smollett's powers of recuperation that he survived to write two such masterpieces of sardonic and humorous observation as his *Travels* and *Humphry Clinker.*

The fourth master of the English novel was Laurence Sterne. Though they owed a good deal to *Don Quixote* and the French novelists, Fielding and Smollett were essentially observers of life in the quick. Sterne brought a self-conscious style, a bookish apparatus and a deliberate eccentricity into fiction. *Tristram Shandy*, produced successively in nine small volumes between 1760 and 1764, is the pretended history of a personage who is not born (before the fourth volume) and hardly ever appears, carried on in an eccentric rigmarole of old and new, original and borrowed humour, arranged in a style well known to students of the later Valois humorists as *fatrasie.* Sterne invented a kind of tremolo style of his own, with the aid of which, in conjunction with the most unblushingly indecorous innuendoes, and with a conspicuous genius for humorous portraiture, trembling upon the verge of the pathetic, he succeeded in winning a new domain for the art of fiction.

Johnson and Goldsmith.—Apart from the novelists, the middle period of the 18th century is rich in prose writers: these include Dr. Johnson, Oliver Goldsmith, Lord Chesterfield and Horace Walpole. The last three were all influenced by the sovereign lucidity of the best French style of the day. Chesterfield and Walpole were both writers of aristocratic experience and of European knowledge and sentiment. Johnson alone was a distinctively English thinker and stylist. His knowledge of the world, outside England, was derived from books, he was a good deal of a scholar, an earnest moralist, and something of a divine; his style reaches back to Browne, Taylor, Barrow and South, though the later influence of Addison and Bolingbroke is also apparent. Johnson himself was fond of the essay, the satire in verse and the moral tale (*Rasselas*); but he lacked the creative imagination indispensable for such work and excelled chiefly as biographer and critic. In his criticism he upholds authority. We go to his critical works (*Lives of the Poets* and *Essay on Shakespeare*) less for their conclusions than for their shrewd comments on life, and for an application to literary problems of a caustic common sense. Johnson's character and conversation, his knowledge and memory were still more remarkable than his ideas or his writings, admirable though the best of these were; the exceptional traits which met in his person and made that age regard him as a nonpareil have found in James Boswell a delineator unrivalled in patience, dexterity and dramatic insight. The result has been a portrait of a man of letters more alive at the present time than that which any other age or nation has bequeathed to us. In most of his ideas Johnson was a generation behind the typical academic critics of his date, Joseph and Thomas Warton, who championed against his authority what the doctor regarded as the finicking notions of Gray. Both of the Wartons were enthusiastic for Spenser and the older poetry; they were saturated with Milton whom they placed far above the correct Mr. Pope, they wrote sonnets (thereby provoking Johnson's ire) and attempted to revive mediaeval and Celtic lore in every direction. Johnson's one attempt at a novel or tale was *Rasselas,* a long

"Rambler" essay upon the vanity of human hope and ambition, something after the manner of the oriental tales of which Voltaire had caught the idea from Swift and Montesquieu.

The very quality of charm that Johnson lacked was possessed in its fullest perfection by Oliver Goldsmith, whose style is the supreme expression of 18th-century clearness and easy graceful fluency. Much of Goldsmith's material, whether as playwright, story teller or essayist, is commonplace. But, whenever Goldsmith writes about human life, he seems to pay it a compliment; his playful and delicate touch could transform every thought that he handled into something radiant with sunlight and fragrant with the perfume of youth. Goldsmith's plots are Irish, his critical theories are French with a light top dressing of Johnson and Reynolds or Burke, while his prose style is an idealization of Addison. His versatility was great, and, in this and in other respects, he and Johnson are constantly reminding us that they were professional authors writing against time for money.

Letters and Memoirs.—Much of the best prose work of this period, from 1740 to 1780, was done under very different conditions. The increase of travel, of intercourse between the nobility of Europe, and of a sense of solidarity, self-consciousness, leisure and connoisseurship among that section of English society known as the governing class could hardly fail to produce an increasing crop of those elaborate collections of letters and memoirs which had already attained their apogee in France with Mme. de Sévigné and the Duc de Saint-Simon. England was not to remain far behind, for in 1718 began the *Letters* of Lady Mary Wortley Montagu; ten years more saw the commencement of Lord Hervey's *Memoirs of the Reign of George II.;* and Lord Chesterfield and Lord Orford (better known as Horace Walpole) both began their inimitable series of *Letters* about 1740. The *Memoirs* of the man-about-town and adventurer, William Hickey, and the *Diary* of the Oxfordshire country parson, James Woodforde, have only recently been made available. These writings, none of them written ostensibly for the press, serve to show the enormous strides that English prose was making as a medium of vivacious description. Chesterfield, whose theme is manners and social amenity, deliberately seeks a form of expression appropriate to his text —the perfection of tact, neatness, good order and *savoir faire.* After his grandfather, the marquess of Halifax, Lord Chesterfield, the synonym in the vulgar world for a heartless exquisite, is in reality the first fine gentlemen and epicurean in the best sense in English polite literature. Both Chesterfield and Walpole were conspicuous as raconteurs in an age of witty talkers, of whose talk R. B. Sheridan, in *The School for Scandal* (1777), served up a *suprême.* The most brilliant comedy of the century, the theatrical output of which is dealt with under DRAMA and the individual playwrights, represents the sparkle of this brilliant crowd: it reveals no hearts, but it shows us every trick of phrase, every eccentricity of manner and every foible of thought. The most mundane of the letter writers, the most frivolous, and also the most pungent, is Horace Walpole, whose writings are an epitome of the history and biography of the Georgian era. Yet, in some ways, he was a corrective to the self-complacency of his generation, a vast dilettante, lover of "Gothic," of curios and antiques, of costly printing, of old illuminations and stained glass. In his short miracle-novel, *The Castle of Otranto,* he set a fashion for mystery and terror in fiction, for mediaeval legend, *diablerie,* mystery, horror, antique furniture and Gothic jargon, which led directly by the route of Anne Radcliffe, Maturin, *Vathek, St. Leon* and *Frankenstein,* to *Queenhoo Hall,* to *Waverley* and even to Hugo and Poe.

Meanwhile the area of the Memoir was widening rapidly in the hands of Fanny, daughter of the worldly-wise and fashionable musician, Dr. Burney, author of a novel (*Evelina*), written before she was well out of her teens; not too kind a satirist of her former patroness, Mrs. Thrale (afterwards Piozzi), the least tiresome of the new group of scribbling sibyls, blue stockings, lady dilettanti and Della Cruscans. Both, as portraitists and purveyors of *Johnsoniana,* were far surpassed by the inimitable Boswell.

Historians.—It is surprising how many types of literary productions with which we are now familiar were first moulded into definite and classical form during the Johnsonian period. In addition to the novel one need only mention the economic treatise, as exemplified in the admirable symmetry of *The Wealth of Nations,* the diary of a faithful observer of nature such as Gilbert White, the *Fifteen Discourses* (1769–91), in which Sir Joshua Reynolds endeavours for the first time to expound for England a philosophy of Art, the historico-philosophical tableau as exemplified by Robertson and Gibbon, the light political parody of which the poetry of *The Rolliad* and *Anti-Jacobin* afford so many excellent models; and, going to the other extreme, the ponderous archaeological or topographical monograph, as exemplified in Stuart and Revett's *Antiquities of Athens,* in Robert Wood's colossal *Ruins of Palmyra* (1753), or the monumental *History of Leicestershire* by John Nichols.

It was not until the third quarter of the 18th century that English literature freed itself from the imputation of lagging hopelessly behind France, Italy and Germany in the serious work of historical reconstruction. Hume published the first volume of his *History of England* in 1754. Robertson's *History of Scotland* saw the light in 1759 and his *Charles V.* in 1769; Gibbon's *Decline and Fall of the Roman Empire* came in 1776. Hume was, perhaps, the first modernist in history; he attempted to give his work a modern interest and, Scot though he was, a modern style. Wm. Robertson was, perhaps, the first man to adapt the polished periphrases of the pulpit to historical generalization. The gifts of compromise which he had learned as Moderator of the General Assembly he brought to bear upon his historical studies, and a language so unfamiliar to his lips as academic English he wrote with so much the more care that the greatest connoisseurs of the day were enthusiastic about "Robertson's wonderful style." Even more portentous in its superhuman dignity was the style of Edward Gibbon, who combined with the unspiritual optimism of Hume and Robertson a far more concentrated devotion to his subject, an industry more monumental, a greater co-ordinative vigour, and a malice which, even in the 18th century, rendered him the least credulous man of his age. Of all histories, therefore, based upon the transmitted evidence of other ages rather than on the personal observation of the writer's own, Gibbon's *Decline and Fall* has hitherto best maintained its reputation.

The increasing transparency of texture in the working English prose of this period is shown in the writings of theologians such as Butler and Paley, and of thinkers such as Berkeley and Hume, who, by prolonging and extending Berkeley's contention that matter was an abstraction, had shown that mind would have to be considered an abstraction, too. Butler and Paley are merely two of the biggest and most characteristic apologists of that day, both great stylists, though it must be allowed that their lucid good sense excites almost more doubt than it stills, and both very successful in repelling the enemy in controversy, though their very success accentuates the faults of that unspiritual age in which churchmen were so far more concerned about the title deeds than about the living portion of the church's estate. Free thought was already beginning to sap their defences in various directions, and in Tom Paine, Priestley, Price, Godwin and Mackintosh they found more formidable adversaries than in the earlier deists. The greatest champion, however, of continuity and conservation, both in church and State, against the new schools of latitudinarians and radicals, the great eulogist of the unwritten constitution, and the most perfect master of emotional prose in this period, prose in which the harmony of sense and sound is attained to an extent hardly ever seen outside supreme poetry, was Edmund Burke, one of the most commanding intellects in the whole range of political letters—a striking contrast in this respect to Junius, whose mechanical and journalistic talent for invective had a quite ephemeral value.

Return to Nature.—While Voltaire and Pope were at their height, the world began to realize that the Augustan age, in its zeal for rationality, civism and trim parterres, had neglected the wild freshness of an age when literature was a wild flower that grew on the common. Rousseau laid the axe to the root of this over-sophistication of life; Goldsmith, half understanding, echoed

some of his ideas in *The Deserted Village*. Back from books to men was now the prescription. Within a few years of Pope's death we find Gray, Warton, Hurd, Webb and other disciples of the new age denying to Pope the highest kind of poetic excellence, and exalting imagination and fancy into a sphere far above the Augustan qualities of correct taste and good judgment. In the revolt from Augustanism we find an explanation of the enthusiasm that welcomed the sham Ossianic poems of James Macpherson in 1760 and Percy's real treasures of 1765 (*Reliques of Ancient Poetry*); the new enthusiasm for Chaucer; the "black letter" school of Ritson, Tyrrwhitt, George Ellis, Steevens, Ireland and Malone; above all, the spurious 15th-century poems poured forth in 1768–69 with such gusto of archaic imagination by a prodigy not quite 17 years of age. Chatterton's precocious fantasy cast a wonderful spell upon the romantic imagination of other times. It does not prepare us for the change that was coming over the poetic spirit of the last two decades of the century, but it at least helps us to explain it. The great masters of verse in Britain during this period were the three very disparate figures of William Cowper, William Blake and Robert Burns. Cowper was not a poet of vivid and rapturous visions. There is always something of the rusticating city-scholar about his humour. The greater part, nearly all his best poetry is of the occasional order. In all the arts that raise the best occasional poetry to the level of greatness Cowper is supreme. In phrase-moulding, verbal gymnastic and prosodical marquetry he has scarcely a rival, and the fruits of his poetic industry are enshrined in the filigree of a most delicate fancy and a highly cultivated intelligence, purified and thrice refined in the fire of mental affliction. His work expresses the rapid civilization of his time, its humanitarian feeling and growing sensitiveness to natural beauty, home comfort, the claims of animals and the charms of light literature. William Blake had no immediate literary descendants, for he worked alone, and Lamb was practically alone in recognizing what he wrote as poetry. But he was by far the most original of the reactionaries who preceded the Romantic Revival, and he caught far more of the Elizabethan air in his lyric verse than any one else before Coleridge. The *Songs of Innocence* and *Songs of Experience*, in 1789 and 1794, sing themselves, and have a bird-like spontaneity that has been the despair of all song-writers from that day to this. After 1800 he winged his flight farther and farther into strange and unknown regions. In the finest of these earlier lyrics, which owe so little to his contemporaries, the ripple of the stream of romance that began to gush forth in 1798 is distinctly heard. But the first poetic genius of the century was unmistakably Robert Burns. In song and satire alike Burns is racy, in the highest degree, of the poets of North Britain, who had kept alive the old native poetic tradition, had provided the strolling fiddlers with merry and wanton staves, and had perpetuated the daintiest shreds of national music, the broadest colloquialisms, and the warmest hues of patriotic or local sentiment. Burns immortalizes these old staves by means of his keener vision, his more fiery spirit, his stronger passion and his richer volume of sound. His eye is unerring, his humour of the ripest, his wit both fine and abundant. In him the return of the 18th century to nature is perfected.

VI. THE ROMANTIC PERIOD

The early part of the 19th century is generally known as the Romantic Period, a period which opened, actually, in the year 1798, when Wordsworth and Coleridge published their *Lyrical Ballads*, in which they made a conscious and successful attempt to break away, both in subject and style, from the tradition of the 18th century. The period ended in the early '30s, by which time nearly all its chief figures had quitted the stage. During these thirty-and-odd years, which saw the long Napoleonic wars, the subsequent restoration, then the stir of Liberal thought all over Europe, years of political and social ferment, some of the greatest literature in the language was produced. As usual, however, it was only in certain departments of literature that the age excelled. These were poetry, chiefly lyrical, and miscellaneous prose. It failed in the drama, although nearly all its major writers made at least one attempt to conquer the theatre. It produced no history that can be compared with Gibbon's *Decline and Fall*, and no biography as good as Boswell's *Johnson*. Its fiction, in spite of Scott and Jane Austen, both supreme masters in their own kind, is inferior to that of the succeeding age, the Victorian. But in poetry and miscellaneous prose, criticism and the essay, this Romantic Period is triumphant. Moreover, it is an age unusually rich in men of letters who are also fascinating as personalities. Scott, Lamb, Byron, Keats, Shelley—to name no other—have each had scores of volumes written round them; and no period in literature since that of Shakespeare has had more enthusiastic students.

The Era of Individualism.—These thirty years are sometimes called the "Romantic Revolt," a name that could be given with more justice to the Romantic movement in France that came later. It is rather misleading when applied to the English period because it suggests the existence of some definite literary authority and something like an organized rebellion against its canons. What actually happened was something vaguer and more complicated. We shall not attempt to define "Romantic," and there is not space in which even to indicate all the forces at work, the hundred and one factors, ranging from the re-discovery of mediaeval ballads to the influence of the French revolution. All that we can do is to find some common denominator of all the major writers of the age, something that not only links Wordsworth and Shelley, Lamb and Byron, but also points to the difference between them and the writers of the previous century. It is not easy. No political or religious belief, no common system of philosophy, no theory of literature, will help us. If, however, we remember that the 19th century itself was an era of individualism, we stumble upon a common denominator. What distinguishes the literature of this Romantic Period is its intense individualism. In the 18th century, an author was essentially a member of a community, a good citizen writing for other good citizens; his appeal was always to common sense, general knowledge; if he described a landscape he took care to give it features that a hundred landscapes have in common; if he expressed feelings, they were only the feelings that it is customary to express in society. The result was a literature that is sensible, social, generalized. When it was weak, it was dull, savourless. The Romantics broke with this tradition. Their first duty, they considered, was to express themselves. Their appeal was always to what transcended common sense. They would become universal in that appeal not by smoothing away all individual characteristics but by reaching the very heart of individuality. They held that to express one's own most intimate thoughts and feelings was really to express everybody. Thus it comes about that these Romantic poets, for all their wonders and crazy flights of fancy, are actually more realistic than the poets in the English classical tradition. It is they who give us "the streaks on the tulip," simply because they are aiming at the individual thing. And when they are at their weakest, they arrive at sheer eccentricity. Their danger always is that they may become mawkishly egoistic or barbarically anti-social.

The Poetic Revolution and Wordsworth.—In poetry this individualism resulted at once in an enlargement of subject matter, a new variety in prosody, a substitution of the best ordinary

speech for the conventional poetical language of the previous age, and a widening and deepening of emotion. In their *Lyrical Ballads,* Wordsworth and Coleridge deliberately aimed at this poetic revolution. Wordsworth's poetical career, unlike that of most of his contemporaries, was a long one, but nearly all his best work was written between 1797 and 1820. He is undoubtedly the most massive poet of his time, though it is not in his two long poems, *The Excursion* and *The Prelude,* semi-narrative, semi-philosophical poems in blank verse, that he is at his supreme height, but in his short reflective lyrics and sonnets and one or two rather longer poems, such as *Tintern Abbey* and *Intimations of Immortality.* This last is perhaps his masterpiece, a blaze of poetic genius. Wordsworth can be duller than any other English poet of similar stature. He is essentially a poet of great moments. Probably he would not object to being so described, for it was his practice to lie in wait for such moments. In his own Lake country, solitary, he would brood over the face of nature, remote from the common bustle of life, until at last the wide sky and the mountains and the bare trees and the very grass were lit up from within, were the vesture of some radiant spirit. He was not a pantheist. He did not see nature as God but only as the sign and symbol of God. All his greatest poems are intimations of immortality. These ecstatic moments of mystical communion he could express in lines that seem extraordinarily simple in structure and language but have a haunting beauty quite unlike that of any other poet. He is especially fond of auditory images and is a master of cadence.

Coleridge.—Coleridge's reputation as a poet hangs chiefly upon three poems, *The Ancient Mariner, Kubla Khan* and *Christabel,* and two of these are unfinished. The imagination at work in these little masterpieces is unique. *The Ancient Mariner* is the most astonishing narrative poem in the language; the exquisitely lovely verses unfold an unforgettable pageant of marvels and horrors. *Kubla Khan* is a fragment of pure romance; it would be hard to find in the same number of lines elsewhere the same curious power of evocation; it is at once as vague and mysterious and yet charged with meaning as a piece of music. Coleridge is the most magical of all our poets. What he has left us is merely the work of a few early years. He took to opium and was then incapable of sustained effort. But he became as great a critic as he was a poet. Indeed, he is perhaps our greatest critic, in spite of his turgid prose style, his second-hand metaphysics and the fragmentary nature of his work. He had enormous reading, a most subtle intellect, and an eye and an ear unusually sensitive to style. In his Lectures on Shakespeare, the more critical chapters of his *Biographia Literaria,* and the odd notes and fragments of lectures on books and authors since collected into various volumes, these gifts are fully displayed. It was he more than any other man who was responsible for the new interpretative mode of criticism, which replaced the judicial method of the previous century. To that century, he was always somewhat unjust, and in reaction against its characteristic judgments, he was always in danger of running to uncritical extremes in his appreciation of the older Romantic writers, from Shakespeare downwards. His was easily the greatest influence of the time. Even Scott and Byron, to say nothing of Wordsworth, Shelley, Keats, Lamb and Hazlitt, were influenced by him. Notwithstanding his comparative failure to achieve sustained work, Coleridge must always be considered one of the greatest figures of his age.

This can no longer be said of the remaining member of this trio of "Lake Poets," Robert Southey, who in his own time was regarded as their equal. Even those fellow poets, such as Byron and Shelley, who most bitterly resented Southey's defection from the Liberal cause would be astonished if they could learn how his reputation as a poet has declined. Southey's epics, notably *Thalaba* and *The Curse of Kehama,* seem now so many monuments of wasted effort and futile ambition. He was, however, a most industrious man and learned prose man too, writing an excellent style, and at least one volume of his, the *Life of Nelson,* has kept its place. Time has dealt a little more tenderly with the picturesque narrative poems of Sir Walter Scott, whose *Lady of the Lake* and the rest are still enjoyed by young readers; but it is as the author of one or two magnificent lyrics, such as *Proud Maisie,* that Scott keeps his place as a poet. Beside him may be set his fellow-countryman, James Hogg (The Ettrick Shepherd), who has never quite had full justice done him. And there are three other poets who for years were regarded as the foremost men of their time but have since dwindled into the authors of a few acceptable lyrics. These are Samuel Rogers (the least important), Thomas Campbell and Tom Moore.

Byron and Shelley.—Between these older men and the three younger poets, Byron, Shelley and Keats, who all died before they reached maturity, may be set the figure of a man who was greater as an influence than strictly as a writer. This was Leigh Hunt, who produced some pleasant verses, some good light essays and some really excellent criticism. His greatest work, however, was done as the inspiring friend of the younger poets, especially Shelley and Keats. Byron was not deeply influenced by any contemporary writer. Oddly enough, Byron, who became a European figure of Romance, was not at heart a Romantic poet at all, a fact that is now recognized. His most lasting work, apart from one or two poignant lyrics, has been in verse of a satirically descriptive order, found at its best in his *Don Juan,* in which his really strong masculine intellect, his witty impertinence and his rhetorical gusto have full scope. He was—and still remains—a symbolic figure of romantic rebellion, though he himself would have been the first to laugh at most of his fervent admirers.

Byron is steadily being overshadowed, however, by a more authentic figure of romantic rebellion. His friend and junior, Percy Bysshe Shelley, has long been recognized as the greater poet, and he is now taking the place that Byron once had, at home and abroad, as a symbolic figure. He was only thirty when he perished in the sea, and it is impossible to imagine what would have become of him had he lived to a ripe old age, for he is the poet of enthusiastic and revolutionary youth. Coming early under the influence of William Godwin (who wrote some novels of merit), Shelley became a philosophical anarchist of a type not uncommon in the later 18th century. He was the Ariel of all such dry Prosperos as Godwin. He is pre-eminently the poet of some future Golden Age, unearthly in its loveliness and innocence. His lyrics (and he is always lyrical, even in his longer poems) have a matchless swiftness and grace and opalescent colouring; they are all vague music and perfume and shifting lights; and neither their beautiful melancholy nor their ecstasies are quite of this world. Indeed, the chief fault of Shelley's poetry is its lack of all ordinary human feeling and its remoteness from common interests. A further weakness is a certain mushiness of phrase, and there are signs that his vocabulary never quite recovered from the influence of the absurd philosophical romances he read (and wrote) so eagerly in early youth. But he was a lyrical genius and a figure of poetry and eager revolt that, at certain ages and always for some readers, completely captures the imagination.

The Genius of Keats.—The last of these young poets died even before he reached his prime, at the age of twenty-six. This was John Keats, who is represented by an early narrative poem, full of faults, the fragment of an epic, *Hyperion,* and a small number of sonnets, odes and short narrative poems. But these are astonishing in their quality; they have a rich sensuousness, a carven beauty of phrase and the everpresent suggestion of a wide brooding imagination, that set their author among the masters of English poetry. When we consider these poems and put beside them their author's letters (full of good writing, high spirits, sense and flashes of unusual wisdom), and then remember not merely his early death but the whole evil circumstances of his life, we can only conclude that English literature lost in him a very great genius, the potential master of almost any form of the art. His actual performance was astonishing, but his promise was nothing less than a wonder.

This period brought about almost as great a change in prose as it did in poetry, a fact that is frequently overlooked. That intense individualism, already mentioned, is as evident in the chief prose writers as it is in the poets. The essay was no longer some-

thing that might have been written by a committee of sensible men, it was as personal and intimate as talk. So, too, criticism became frankly personal, and the only standard was the critic's own likes and dislikes. These Romantic prose writers expressed themselves first of all, and even their criticism was a chapter of autobiography. One result of this was a change in prose style. The 18th century prose style had been antithetical, balanced, impersonal. This standard style was by no means abandoned altogether (it exists to this day) and most of the quarterly reviewers used it, but all the more important prose writers (with the exception of Walter Savage Landor, who in his massive prose *Imaginary Conversations*, as in his exquisite epigrammatic verses, aimed at a classical balance, dignity and brevity of phrase) turned away from it to styles more personal, more highly coloured and musical, nearer to poetry. The most ambitious of all these prose colourists and musicians was Thomas De Quincey, who produced one masterpiece of autobiography and day-dream and elaborately notated prose, in his *Confessions of an English Opium-Eater*, and then gently subsided into being a writer of learned and ingenious articles for the magazines.

The Great Essayists.—The two greatest essayists of the time are Lamb and Hazlitt. Charles Lamb was a considerable critic; he was an exquisite essayist and one of the best letter-writers in the language; but he was greatest of all simply as a personality. In him that intense individualism seems to run into eccentricity, almost into madness, yet there is in him everywhere, in the midst of his wild dark humour, a sweet sanity, a wisdom of the spirit. Above all the great, the picturesque, the fascinating personalities of his time, he is the best-loved. His friend, William Hazlitt, whose reputation is equally balanced between the personal essay and criticism, was a very different person, wanting in humour and tenderness, a difficult friend, a ferocious enemy. He had a good strong intellect and a fine taste, and no man did more in calling attention to what was true and beautiful and in communicating a zest for good writing.

The official criticism of the period, that which was associated with the quarterlies, falls a long way behind the scattered notes of Coleridge and Lamb and the headlong essays of Hazlitt. It suffered from two defects, first, that it was influenced by political and social considerations; secondly, that it never quite escaped from the 18th century, was rooted in an outworn tradition, and did not understand what was going on in literature. The Whig *Edinburgh Review* was the first of the quarterlies, and its editor, Francis Jeffrey, with whom were associated Sydney Smith (a great wit) and Brougham, was a man of real ability, but neither he nor his colleagues ever understood what the major writers of their time were trying to do. The Tory rival of the *Edinburgh*, the *Quarterly Review*, was even more unsympathetic. Its first editor was William Gifford, a somewhat ferocious scholar; and later it was edited by John Gibson Lockhart, Scott's son-in-law, who suffered from a supercilious cleverness but set it aside to write a really masterly *Life of Scott*, the best biography the age produced. Lockhart had earlier been associated with *Blackwood's Magazine*, in which John Wilson (Christopher North) roared and cudgelled and rhapsodized, especially in the series of dialogues afterwards published as *Noctes Ambrosianae*, which contain some entertaining criticism, some even more entertaining character sketches and some uproarious high spirits. For some time *Blackwood's* had a rival in the *London Magazine*, which did not live long but nevertheless succeeded perhaps in bringing out more masterpieces than any other magazine before or since. But the greatest journalist of his time and one of the best writers of plain solid prose was William Cobbett, whose *Rural Rides* still remains one of the best pictures of the English countryside we have.

In history and philosophy, especially when they are regarded as departments of literature, this period was decidedly inferior to the one that went before and the one that came after. It has no Hume, no Gibbon, no Carlyle, not even a Macaulay. Hallam, Mitford, Roscoe, Mackintosh, these are its figures, respectable enough but a long way from the front rank. And though Malthus, Bentham and James Mill may be sufficiently important thinkers, their respective works are far removed from literature.

Jane Austen and Scott.—In fiction, as we have already seen, the period would make a very poor show indeed if it were not for two outstanding figures. During the opening years of the century, there is a curious lull in fiction, perhaps due in part to the great popularity of the narrative poem. But two kinds were being essayed, and both of them found their masters. (We must not overlook, however, that satirist of the philosophers and the romantics, Thomas Love Peacock, whose chief contributions were to fiction and whose novels are unique in their blend of intellectual high spirits and ironic comment.) The earlier to mature was the novel of ordinary domestic life and manners, depending for its appeal on the close observation of the writer and his (though it was nearly always her) power of making quite ordinary people entertaining as characters. Fanny Burney, Maria Edgeworth, Susan Ferrier, all these ladies made some progress in this delicate art, but it was Jane Austen who brought it as near to perfection as it seems possible to bring it. Nothing could seem more unpromising than her material, the uneventful lives of dull, well-fed people in quiet corners of England, but by the enchantment of her art, her sense of character, her bland irony, her exquisite powers of organization and presentation, she has given us half-a-dozen novels that have aroused the enthusiasm of every succeeding generation of readers. She is our most finished artist in fiction.

The other kind was the historical novel. A delighted discovery of the past marks the whole age, but it was left to Sir Walter Scott, already practised in poetic narration, steeped in the lore of his own Border country, experienced in men and affairs, to make this discovery the servant of fiction. This he did in the great series of romances that began with *Waverley* in 1814 and captured not only the British Isles but all Europe. The weaknesses of Scott, who wrote too much and too quickly, are a marked carelessness not merely in style but in actual narration, and a certain limitation in his thought. But these are far outweighed by his massive virtues, the way in which he combines the personal and historical interests, the generous breadth and fine rush of his narrative and his solid sense of character. Other writers, working over similar ground, have improved upon his work in this particular or that, but as an all-round narrator of historical romance he has never been excelled. The age honoured him both as a writer and a man, and now he still honours the age, rich as it was in arresting figures and triumphant masterpieces.

(J. B. Pr.)

VII. VICTORIAN PERIOD OF THE 19TH CENTURY

Introduction.—During the Romantic Revival the pendulum had swung from revolt to reaction, from rapturous hope to despair. The revolutionary ardour of the youthful Wordsworth and Coleridge had deadened into the rigidity of *The Ecclesiastical Sonnets* or sunk into the spiritual lassitude of the "Ode to Dejection." Shelley's metaphysical and Byron's political visions of a world regenerated by freedom had been quenched in the waves of the bay of Spezzia and the swamps of Missolonghi. The generation that had endured the disastrous aftermath of the Napoleonic wars could never recapture the intoxication of the Revolutionary dawn. Yet it could not find permanent satisfaction in the humorous irony of Peacock or in the communion with beauty of Keats. It began, therefore, a new forward movement. Its conception of progress was no longer the taking of Heaven by storm, but gradual, orderly advance. The Reform Bill of 1832 was a renewed pledge of faith in slowly working political machinery, instead of catastrophic upheaval, as the means of social betterment. In the scientific sphere geological discovery accustomed men to the idea of gradual transformation, and prepared the way for the evolutionary doctrines that have closed for ever the vision of humanity attaining perfection at a bound. As the ascent of man was shown to be by stages, the importance of education in furthering his development was realized as never before.

Such were the conditions in which the literature arose that is known by the name of the young queen who in 1837 succeeded to the throne of Elizabeth and Anne. Each of these has also given

her name to a literary epoch. The Tudor queen was herself the cynosure of the poets and playwrights of her day; Anne was no magnetic personality, but her court and Capital were the focus of the Augustan wits. When Victoria came to the throne, literature had learned neither to look for inspiration to a sovereign nor to concentrate its gaze upon the charmed circle of the town. Yet it was not for nothing that from 1837 to 1900 a woman was the centre of social and, in a sense, political life. Feminine activities were thereby stimulated in all fields, including that of literature. And it made for that reticence in the treatment of sexual problems which, whether considered a merit or a defect, was, till its later phases, distinctive of the Victorian period.

That period is more remarkable for the high level of its attainment in very varied branches of literature than for absolute pre-eminence in one. The Elizabethan age primarily spells Drama; the Augustan, Satire; the Romantic Revival, Poetry. The Novel may claim to be the most representative Victorian type. Yet does either *Pickwick* or *Vanity Fair* count for as much as Newman's *Apologia* or Darwin's *Origin of Species?* It was in fields outside of pure literature, not only in science and theology, but history, law, and economics, that the age produced much of its most notable work. These are, however, primarily the concern of others than the historian of literature.

POETRY

Tennyson.—In the highest sphere of letters, poetry, the Victorian achievement is linked with, and yet distinct from, that of the preceding age. When the young Cambridge prizeman, Alfred Tennyson, published his first volumes of verse in 1832 and 1833 an unfriendly critic accused him of "out-babying Wordsworth and out-glittering Keats." He had not Wordsworth's sense of the mystical union of Nature and man, but excelled him in exactness of observation and description. He was not absorbed, like Keats, in pure beauty, but practised a more fastidious and scholarly art. From the first even in his lovely reshaping of classical stories, and more explicitly in such poems as "The Palace of Art" and "The Two Voices," there is an undercurrent of *malaise*. In *In Memoriam* (1850) the sudden death of a deeply loved friend raised the fundamental questions of the age when religion and science were beginning their conflict. Even if the poet's solution may seem inadequate to-day, the stanzas in their exquisitely apt metre are imperishable cameos of mid-Victorian life in the rectory and the hall. And if the lapse of years has made *The Princess* (1847), in its treatment of woman's sphere, a museum-piece it lives by the beauty of its songs. In the *Idylls of the King* (1859–85) Tennyson allegorized King Arthur as the soul of man at war with the senses. Such a conception could not be successfully combined with that of Arthur in his human relationships, especially as the husband of Guinevere. The poet is to blame for the incongruity. But it is unjust on that account not to recognize the spiritual insight in the handling of the central theme or the narrative beauty of individual *Idylls* and episodes. The "reaction against Tennyson" of which the *Idylls of the King* has borne the brunt, has spent much of its force; his place is secure as the representative poet of his age.

The Brownings.—Strongly contrasted, except in fundamental convictions, is Robert Browning, educated outside the traditional pale, and except for an early debt to the "sun-treader" Shelley, curiously dissociated from the poets of the Romantic Revival. He throws back to Donne and the "metaphysical" school in subtlety of thought and pregnancy of style. He is preoccupied with the inner life of the individual, his motives and aspirations. After a period of experiment in dramatic and semi-dramatic forms he found the monologue to be his fittest instrument and made use of it in *Men and Women* (1855), *Dramatis Personae* (1864) and elsewhere. The speakers range from an Arab physician and a Greek "tyrant" to Renaissance painters and thence to moderns like "Bishop Blougram" and "Sludge the Medium." With his cosmopolitan interests and knowledge of the arts Browning could always furnish an appropriate setting. But he rings the changes on the same leading motives—earthly life as a probation, high failure worth more than low success. Behind his "men and women" looms the interpreting personality of their creator. The method reaches its climax in *The Ring and the Book* (1868–69) where it is used to illuminate from the lips of criminal, victim, priest, the pope and others all of brutality and beauty that lies behind the bare facts of an Italian murder case. The frequently uncouth and grotesque phrasing serves, as a rule, a dramatic purpose. Anapaestic and dactylic rhythms suited him best for poems in stanza forms, but it is in passages of blank verse of strangely individual fascination that he achieved his rarest metrical effects.

Browning's fame grew more slowly than that of his wife but has now overshadowed it. Her poetic art has weaknesses—sentimentality, facile fluency, and slovenly technique—which are in particular disfavour to-day. But in her so-called *Sonnets from the Portuguese,* written during her courtship, the intensity of her passion swept sentimentality away, and the curb of the sonnet-form checked the too easy flow of her verse. In short lyric outbursts, "Cowper's Grave" and "The Cry of the Children," she struck a peculiarly tender note. She had not the genius for narrative, and *Aurora Leigh* (1856), a blank-verse novel, has long outlived its immediate success.

Matthew Arnold.—Mrs. Browning's study of Greek literature had taught her nothing of Greek restraint. Far otherwise was it with the young Oxford graduate, Matthew Arnold, who in 1849 made his first poetic venture. Yet the ardent classicist was in his depths a modern. None felt more acutely than he the shifting of the traditional religious and intellectual landmarks. His is the cry of one, "Wandering between two worlds, one dead, the other powerless to be born." For relief he goes to the calm and serenity of Greek art, and to the healing touch of Nature. All these elements are blended in *The Scholar Gipsy* and *Thyrsis* where the genius of Greek pastoral elegy gathers in her hands flowers from the Oxford fields, and hears the troubled sound of piping from other than Dorian flutes. Nowhere was that piping more troubled than in the verse of Arnold's Rugby and Balliol friend, A. H. Clough. *Thyrsis* and such of his own lyrics as "Qua Cursum Ventus" will do more for his immortality than his introspective hexameter poems, *The Bothie* and *Amours de Voyage.*

The Pre-Raphaelite Poets.—While Arnold and Clough were confronting the challenging issues of their own day, a group of young poets and artists were turning their gaze backward to the middle ages. Linked in the pre-Raphaelite Brotherhood they issued in 1850 the short-lived *Germ* where they advocated sincerity in art and poetry and sought to renew the mystical fervour of the age of the primitives. To D. G. Rossetti, of Italian parentage, love in *The Blessed Damozel* is a transcendental ecstasy as it was to Dante and his circle of whom he became the interpreter to Victorian England. Later in the eerie romance of early Scottish history and legend he found material for *The King's Tragedy* and *Sister Helen.* In his sonnet-sequence, *The House of Life,* in which each sonnet is "a moment's monument," his mystical conception of love was blended with a sensuous warmth unfamiliar to the North and misunderstood by the profane. To his sister Christina love was known in its unearthly and devotional aspects, and it found in her sonnets, *Monna Innominata,* and her lyrics that exquisitely simple and heartfelt expression which was the ideal of the pre-Raphaelites but which they did not all attain.

The *Germ* had its successor in *The Oxford and Cambridge Magazine* (1856) chiefly inspired by William Morris. For him and his friends as for the Rossettis, the middle ages were full of enchantment. But it was to feudal France and legendary Britain that they were drawn. In *The Defence of Guenevere* and other Arthurian poems Morris did not, like Tennyson, spiritualize episodes from the cycle, but got deep into the heart of mediaeval passion. Here, and in such feathery lyrics as "Two Red Roses across the Moon" he struck his most original notes. His growing devotion to Chaucer led him to emulate *The Canterbury Tales* in a long series of narrative poems, *Jason, The Earthly Paradise* (1868–70), and (as Icelandic saga more and more captivated him) *Sigurd the Volsung* (1877). Morris has the story-teller's art, and felicities of detail are everywhere, but the poems in their somewhat mannered simplicity have a derivative air.

Swinburne.—In *Poems and Ballads* (1866) A. C. Swinburne accentuated the sensuousness of *The House of Life* into frank voluptuousness. Unlike his Balliol forerunner, Matthew Arnold, he had drawn from Greek literature a creed of hedonistic nihilism which thrilled through "Dolores" and "Laus Veneris." It was given an intoxicating quality by the new singer's almost magical mastery over word and rhythm. In *Atalanta in Calydon* the same astonishing virtuosity gave renewed life to an ancient story, and to the dialogue and choruses of Greek tragedy. Swinburne's prolific later output of lyric, drama, and narrative verse displayed no widening of imaginative vision, and virtuosity tended to become a mechanical device. But through the "voluptuous garden-closes" there was ever the purifying virtue of the elemental forces he loved—the sun and stars, the winds, and, above all, the sea.

As Swinburne had put to new use the machinery of Greek drama so did Edward FitzGerald that of Spanish in his versions, not merely translations, of Calderon's plays. Still more free was the handling of his original in his adaptation (1859–68) of the *Rubáiyát* of the Persian poet, Omar Khayyám. In 100 stanzas of novel and arresting rhythm he gives flawless expression to the creed of *carpe diem.* No other Victorian poet was so felicitously to hold the East in fee. But Sir A. Lyall's *Verses Written in India* gave a fine edge to the contrast between native and English life and thought. Sir Edwin Arnold's sympathetic interpretation in facile blank-verse of Buddha's career in *The Light of Asia* (1879) had a wide vogue.

Coventry Patmore.—The Roman Catholic poetic tradition revived by Christina Rossetti was carried on by Coventry Patmore who, after his earlier illumination of the domesticities in *The Angel in the House* (1854–56), displayed in the Odes of *The Unknown Eros* (1877) a strangely different temper and diction reminiscent of the metaphysical school. Alice Meynell had much of the range and quality of Christina Rossetti with more conscious and deliberate art. It was due in part to her and her *entourage* that Francis Thompson was enabled to gain an ear for the intricate harmonies and mystical imagery of *The Hound of Heaven* and its companion poems.

The shipwreck of his fortunes from which Thompson was saved befell two men whose poetic interpretation of life was diametrically opposed to his. James Thomson (B.V.) could, however, give voice to other moods than the stark pessimism of *The City of Dreadful Night* (1874). John Davidson in his *Fleet Street Eclogues* and *Ballads* (1893–97) blended verbal crudities and rebellious temper with genuine imagination and power. But personal misfortune is less of a tragedy in the poetic career than the downfall of too meteoric a reputation. Such has been the fate of J. M. Tupper, whose *Proverbial Philosophy* had an ephemeral vogue; of Lewis Morris with his modern applications of Greek legends in the *Epic of Hades;* and of Stephen Phillips whose plays in verse, over-rated when brought on the stage, have more merit than is now allowed.

Anglo-Irish Poets.—There was a feeble rustle from English history and scenes in the verse of Alfred Austin. In strong contrast was the inspiration from the legends and annals of Ireland that breathed full and free through the lyrics of W. B. Yeats. Master of that exquisitely simple and liquid speech which is the secret of Anglo-Irish genius, he has "spread his dreams under our feet" and carried us to the enchanted haunts of the Gael. The mysticism of G. W. Russell (A.E.) looks inward to the Ireland in the heart, while James Stephens gives voice to the humorous realism which is its complement in the Celtic "make-up." Moira O'Neill has shown that Ulster too has its *Songs of the Glens of Antrim.* Herbert Trench had a style more highly wrought than that of his brethren of the Pale, and the top of his achievement was with other themes than theirs. The inherited Celtic strain worked more potently in the genius of the English-born George Meredith, though blended with an intellectual apprehension of man's kinship with earth and his upward evolution. From the poems dominated by this conception Meredith ranges through the dewy freshness of *Love in a Valley,* the tragic intensity of *Modern Love* (1862) and the apocalyptic vision of the *Odes in Contribution to the Song of French History* (1898).

Local Poetry.—The poetry of local association which culminates in the Irish literary movement can point to other achievements in more specialized spheres. William Barnes made music on the Doric lute of the Dorset dialect. T. E. Brown chanted *Foc'sle Yarns* in an Anglo-Manx recitative. The soft accent of Devon sings through the "Drake's Drum" of Sir Henry Newbolt, though elsewhere it is in a pure strain of the King's English that he tells of the deeds of the King's Englishmen on sea and shore. The more consciously imperial muse of Rudyard Kipling has enlisted the argot of the Indian barrack-room and compound, but it dispenses with this when it takes the loftier range of the "Recessional" or of the panegyric on the Sussex of Wilfrid and to-day. In A. E. Housman's *Shropshire Lad* (1896) the local setting is of less account than the sombre impress and the gem-like finish of his art.

Religious poetry has had its chief voices in John Keble, carrying on the Anglican tradition of George Herbert, with a new Wordsworthian note; and in J. H. Newman, a greater master, except for some inspired hymns, in prose than in verse. The lighter sides of life have had numerous interpreters in a series of highly accomplished craftsmen in verse. R. H. Barham, C. S. Calverley, Edward Lear, J. K. Stephen, Austin Dobson, and W. S. Gilbert are not merely wits but adepts, in their various styles, in verbal and metrical technique. And it is a kindred virtuosity, applied in a loftier sphere, that helps to give distinction to the poetry of Robert Bridges, who is himself a student of the metrical art. His technical accomplishment and a surface austerity have tended to mask the underlying spontaneity and tenderness of the best of his lyric verse. He wears the Laureate's wreath worthily, but not, like Tennyson, with popular acclaim.

Drama.—In the considerable field of drama the Victorian period till its closing years marks an almost complete divorce between literature and the stage. In the year of the Queen's accession the publication of Browning's *Strafford* and R. H. Horne's *Death of Marlowe* showed that poetic drama was not dead, but it was Lytton's theatrically effective *Richelieu* and *The Lady of Lyons* (1838) that won favour on the boards. J. Westland's verse-tragedies had a short life; Swinburne's were not intended for the stage. The genius of Henry Irving illumined the tawdry but pathetic *Charles I.* (1871) of W. G. Wills, and afterwards found finer material in Tennyson's plays, especially *Becket.*

Melodrama was more to the taste of the early Victorians, as provided by J. B. Buckstone and Dion Boucicault. The latter's *Corsican Brothers* had a prolonged vogue, but his gifts of dialogue and humour show to more advantage in his Irish dramas *The Colleen Bawn* and *The Shaughraun,* while his earlier *London Assurance* (1841), in a vein of higher comedy, has life in it yet. So too has the most famous of the many farces of the time, J. M. Morton's *Box and Cox* (1847). This cannot be said of J. R. Planché's burlesques, or even of Tom Taylor's deftly constructed plays like *Still Waters Run Deep* (1855) or *'Twixt Axe and Crown* (1870).

In T. W. Robertson's *Society* (1865), followed by *Ours, Caste,* and *School,* the voice of nature is again heard amidst theatrical artifice and conventionality, and, in spite of all changes, still sounds in these comedies to-day. The cheaper sentiment of H. J. Byron's successful *Uncle Dick's Darling* and *Our Boys* (1875) has lost its appeal. W. S. Gilbert showed in his verse-plays, beginning with *The Palace of Truth* (1870) hints of the genius for topsy-turvy logic that was to be fully revealed in his comic opera *libretti.* In the 1890's the witty dialogue of Oscar Wilde's artificial comedies and the high craftsmanship of the earlier plays of Sir. A. W. Pinero and H. A. Jones begin that dramatic renaissance which, stimulated by the influence of Ibsen, has revolutionized the outlook and methods of the English stage.

THE NOVEL

Character.—In the other main field of creative literature, the novel, the Victorian age, in spite of its limitation of outlook, had closer links with the 18th century than with Scott or Jane Austen. W. M. Thackeray, as his *English Humourists* proves,

was a close student of that century and his conception of the novel was akin to that of Fielding, as the "comic epic in prose." Thus in the broad sweep of their scheme and the variety of their characterization, *Vanity Fair, Pendennis,* and *The Newcomes* (1848–55) descend from *Tom Jones.* In other ways Thackeray carries on the Fielding tradition. His favourite targets are hypocrisy and affectation; he makes confidants of his readers; his English, less virile but more modulated than that of Fielding, is fastidious and pure. But he lacks Fielding's buoyant animalism and his devastating irony. With all Thackeray's command of mockery and pathos and charm, he had not the supremely creative gift; even Becky Sharp is not completely flesh-and-blood. Hence his historical imagination, working in a sympathetic medium, has produced in Henry Esmond and Beatrix figures that are more real to us than the Osbornes and the Crawleys who have faded with the social changes of two generations. But the keenly-observed idiosyncrasies of a Barry Lyndon and a Blanche Amory and "The Campaigner" will be repeated, in different guises, from age to age.

Dickens.—If Thackeray is a lesser Fielding, Dickens is a highly magnified Smollett. Some of the sailor folk with whom Smollett had been thrown were transformed by him into eccentrics of idea and speech. By Dickens the whole world was seen under such a transformation. G. K. Chesterton has said that Mr. Pickwick is a fairy. In this sense all the most typical Dickens characters (1837–70) Sam Weller, Mr. Micawber, Uriah Heep, Mrs. Gamp, are fairies, good or bad. They never existed or could exist on solid earth, and they have therefore the indestructible life of the supernatural. More than any other Englishman since Shakespeare, Dickens was a magician who could call spirits from the vasty deep. He was of course much else. He was a Cockney of the Cockneys; a humanitarian reformer with his zeal sharpened by his own early privations; a sentimentalist; and at his worst, a writer of very bad English. And in *The Tale of Two Cities* and *Barnaby Rudge* he could take on the mantle of the historical novelist. But in essence he is the modern Prospero.

The Brontë Sisters.—While the kaleidescopic fantasy of Dickens was at work in London, on the northern moors the Brontë sisters were infusing into English fiction the passionate intensity of their lonely and introspective lives. In *Jane Eyre* (1847) and *Villette* (1853), whether the setting be that of a Yorkshire hall, with a harrowing secret, or a Brussels boarding-school, with a too magnetic "professor," the tumult of the heart of Jane and of Lucy Snowe is a revelation of Charlotte's own emotional experiences. Emily, with a less realistic grip but with fiercer imagination transfigures the tale of terror into the masterpiece of *Wuthering Heights* (1847), red-hot with passion and dark with Rembrandtesque gloom. Mrs. Gaskell, the biographer of the Brontës, sets her own tales against the background of industrial Lancashire, but her delicate observation is at its fine flower in the little Cheshire idyll of *Cranford* (1853).

George Eliot.—George Eliot (Mary Anne Evans) pictured from the first in *Scenes from Clerical Life* (1858) the domestic tragedies that lay behind the placid beauty of her native Warwickshire. In *Adam Bede* (1859) and *The Mill on the Floss* (1860) it is in the same setting that the chief personages work out their destinies according to her determinist creed. But her creative power shows its richest fruit in the humours of Mrs. Poyser and the Tulliver aunts. *Middlemarch* (1871–72) carries on the Warwickshire series with some loss of freshness but with enhanced analytical power. *Silas Marner* is a masterly miniature. But in political, historical, and racial fiction (*Felix Holt, Romola, Daniel Deronda*), her genius became submerged under alien loads.

George Eliot's title, *Scenes from Clerical Life,* might have been used by Anthony Trollope to cover the Barsetshire novels from *The Warden* and *Barchester Towers* to *The Last Chronicle of Barset* (1851–67). Himself a civil servant, without clerical associations, he succeeded by some intuitive gift in the nicely discriminated delineation of ecclesiastical types from the bishop and his stronger half, Mrs. Proudie, downwards. He was scarcely less successful with the other "county" sets, nor did he fail when he tried his hand on the political novel. But here he had been anticipated by a master, who knew every turn of the game. Benjamin Disraeli after experimenting on other lines turned in *Coningsby* (1844) and *Sybil* (1845) to "the condition of the people" question and in *Tancred* (1847) to the wider problem of racial destiny. The flamboyancy of the style matches the glow of social aspiration which has its foil in the satiric edge of the professional portraits—Rigby, Tadpole and Taper.

The Humanitarian Novel.—It was the practical reforming zeal of a parson with Chartist sympathies, that inspired Charles Kingsley in *Yeast* (1848) and *Alton Locke* (1850), while in *Hypatia* and *Westward Ho* he revives the clash of conflicting moral and religious ideals in 1st century Egypt and Elizabethan England. Charles Reade showed a similar union of historical imagination and propagandist zeal, with more lurid intensity, in *The Cloister and the Hearth* (1861) and *It's Never too late to Mend* (1853). His humanitarian interest in convict prison reform was mingled in Lord Lytton's *Paul Clifford* (1839) and kindred tales with a sentimental glorification of criminals. This sentimental alloy runs through Lytton's prolific output of social and domestic novels, studies in the occult and historical romances, of which the most purely imaginative, *The Last Days of Pompeii,* has worn best. Crime and mystery pre-occupied Wilkie Collins in *The Woman in White* and other *tours de force* of ingenious construction. Mrs. Henry Wood and Miss Braddon both shared this power of telling a well-knit and arresting tale. "Ouida" (Louise de la Ramée), though she had a sense of beauty and of pathos, gave to the more flamboyant elements in the Lytton type of romance an exotic flavour that touched burlesque.

It needs an effort to realize that Charles Lever's novels are of the same Anglo-Irish origin as the poems of Yeats and "A. E." But the gaily irresponsible episodes of Cork and Dublin garrison life in *Charles O'Malley* are an other than poetic avenue of escape from the everyday world. Among other regional novels R. D. Blackmore's *Lorna Doone* (1869) is pre-eminent less as a historical romance than as compact of Devon dialect, scenes, and characters. George Macdonald and William Black continued from different angles the delineation of Scottish types and scenes before the more minute realism of the "Kailyard" school of Sir J. M. Barrie, S. R. Crockett and Ian MacLaren. The romantic genius of R. L. Stevenson looked backward in *Kidnapped* (1886) and its successors to the Scotland of the Jacobite era, or roamed through uncharted regions in *Treasure Island* (1883) and *Dr. Jekyll and Mr. Hyde* (1886). If the high artifice of his style sometimes overloaded his longer tales, he is a master of the short story. Here too is Rudyard Kipling's chosen field. In *Plain Tales from the Hills* (1887) and similar collections, and on a broader canvas in *Kim* he has exhibited with searching realism Anglo-Indian and native life in their manifold facets. In the *Jungle Books* (1894–95) he has explored a fascinating region close to, but outside of, human ken. But even Mowgli's experiences are ordinary compared with the adventures of the Alice of Lewis Carroll (C. L. Dodgson) *in Wonderland* (1866) or *Through the Looking-Glass,* where the March Hare and the Queen of Hearts are "forms more real than living man."

The born apostle of romance can find it anywhere. George Borrow, agent of the Bible Society, wove episodes from his travels, together with experiences among gypsies, prize-fighters and vagabonds of the road, into a magnetic blend of autobiography and fiction in *The Bible in Spain, Lavengro* and *The Romany Rye* (1843–57). More devotional minds than his have turned the novel to semi-religious use. Elizabeth Sewell's *Amy Herbert* and Charlotte M. Yonge's *The Heir of Redclyffe* were in the Anglo-Catholic tradition which later in the century made a magnetic appeal through J. H. Shorthouse's mystical and semi-historic *John Inglesant* (1881). A more characteristically Victorian ideal was exhibited in Dinah Mulock's *John Halifax, Gentleman;* and Thomas Hughes in *Tom Brown's Schooldays* enshrined the practical gospel of muscular Christianity. Mrs. Oliphant in *Salem Chapel* and M. Hale White in *The Autobiography of Mark Rutherford* pictured the rebellion of fine spirits against narrow provincial pietism. Mrs. Humphry Ward dealt with a more purely intellectual crisis in *Robert Elsmere,* where an Anglican parson loses his

faith in the Christian creed. It was in stark revolt from all Victorian religious and domestic influences that Samuel Butler penned the vitriolic *Way of all Flesh;* and it was the bitterness of one bred outside these influences that wrung from George Gissing such studies in pessimistic realism as *Born in Exile.*

Hardy and Meredith.—But a pessimism that is mainly the outcome of personal experience seems insignificant beside the spirit of philosophic fatalism that broods over the Wessex novels of Thomas Hardy. Throughout the quarter of a century of production from *Under the Greenwood Tree* (1872) and *A Pair of Blue Eyes* (1873) to *Tess of the D'Urbervilles* (1891) and *Jude the Obscure* (1894), Hardy maintains the same sense of the kinship of man and nature, the same ironic conception of the working out of human destinies. But the rustic humours and the pastoral setting give more relief to the earlier tales; in the later the tragic evolution is more relentless and austere. George Meredith also, during the well-nigh 40 years that lie between *The Ordeal of Richard Feverel* (1859) and *The Amazing Marriage* (1895) took as his starting-point the kinship between man and nature. But his individual men and women are not shown in the toils of circumstance; they are all working out their own fates as members of a civilized society, in which the relations of the sexes are of predominant importance. Because Meredith's world is outwardly akin to Thackeray's we realize the gulf between his brilliant, vivid heroines and their pallid forerunners. But in the elliptical pregnancy of his style he came near to breaking the mould of the narrative art that Thackeray had handed on from the 18th century masters of fiction and had stamped with his own individuality.

History, Biography and Essay.—It was by his mastery of this narrative art that T. B. Macaulay gave to his *Essays* and to his unfinished *History of England* (1849–61) the attraction of a novel. His Whig sympathies doubtless led to some distortion of perspective and to propagandist selection from his vast store of memorized material. But if truth sometimes escapes between his antitheses, this is the concern of history, and it does not affect the lucidity of his style or his descriptive genius. His nephew and biographer, Sir George Trevelyan, carried on with less rhetorical art his tradition in politics and letters. A more austerely Radical outlook, affected partly by French influences, characterizes Lord Morley's studies of Burke, Voltaire and Rousseau.

Carlyle.—Thomas Carlyle was not only, like Macaulay, an essayist and historian but also a semi-philosopher. *Sartor Resartus* (1833–34) is, under a thin veil, a spiritual autobiography in which Calvinistic morality and Kantian idealism are predominant elements. In his lectures on *Heroes* (1840), Carlyle gave his most genial interpretation, through a galaxy of examples, of the hero-worship which took more challenging form in the biographies of Cromwell and Frederick the Great, and became aggressive in the later political pamphlets. In his *French Revolution* (1837) we read history by the lightning-flashes of a style of jagged beauty that sometimes blinds us to the arduous toil that went to the making of the work.

J. A. Froude, Carlyle's biographer, shared his propagandist views which coloured his presentation of Tudor history set forth in flexible and melodious prose. From the opposite angle, but with something of the same picturesque power, J. R. Green in his *Short History* traced the fortunes of the English people. The fervour of Sir John Seeley's belief in the imperial destinies of that people lent a glow to his *Expansion of England,* as did Goldwin Smith's exactly opposite views to *The Empire* and other separatist writings. Sir W. Napier and A. W. Kinglake bring energy, sometimes controversial, and glow into the sphere of the military historian.

Of the more purely scientific historians, building upon documentary or legal bases, only the more prominent names can be mentioned—H. T. Buckle, Henry Hallam, George Grote, Sir F. Palgrave, E. A. Freeman, William Stubbs, S. R. Gardiner, Mandell Creighton, F. W. Maitland, Sir Henry Maine, W. E. Lecky, A. V. Dicey, James Bryce and Lord Acton. The style of most of these has the virtue of aptness to the subject-matter, and with some it can rise on occasion to eloquence, but truth not art is their quest. So too with the writers on economic and philosophical subjects, though J. S. Mill stands by himself. The classic simplicity and purity of his style in his *Principles of Political Economy* (1847), *Liberty* and his *Autobiography* (1873) will always give them a place in literature however views may change. And this is true for different reasons of a later philosopher of a different school, F. H. Bradley. The literary quality, though not absent, is more subdued in the writings of Walter Bagehot, Leslie Stephen, James Martineau, F. D. Maurice and T. H. Green. The scientific enquirers had no direct concern with letters. But some of the phrases in which the doctrine of evolution was set forth by Charles Darwin himself, or by Herbert Spencer and T. H. Huxley, "the survival of the fittest," "the struggle for existence," "adaptation to environment," had an arresting imaginative quality. Huxley in especial had the secret of a style perfectly tempered for argument and exposition, and, when he desired, matchless for invective.

Ruskin.—Among the writers of imaginative prose John Ruskin stands conspicuous by the volume and variety of his work. But the more he changes the more he is the same; national and individual welfare is throughout his concern. In *Modern Painters* (1843–60) a defence of Turner grew into an exposition of the true principles of beauty in nature and in art; *The Seven Lamps* and *Stones of Venice* interpreted to a commercialized age the spiritual message of Gothic architecture. The same message, applied to another sphere, is set forth in his writings on political economy beginning with *Unto this Last* (1862) and in his letters on social subjects in *Time and Tide* and *Fors Clavigera.* His style has a similar unity in diversity. The purple elaboration of *Modern Painters* is replaced in *Unto this Last* by limpid simplicity, but the alliteration and the balanced cadence and the biblical echoes remain.

William Morris in his lectures and visionary tales blended, like Ruskin, artistic and social "hopes and fears." But Walter Pater in his studies of the Renaissance art was seen in detachment from extraneous influences as a revelation of sensations and emotions in all their intensity.

By the grace and delicate precision of the style in his autobiographical *Apologia* (1869) and other controversial writings Cardinal Newman takes a foremost place among Victorian masters of prose. Matthew Arnold, from the opposite pole of thought, eulogized Newman's prose as "of the centre." His own highest qualities were not shown in his treatises on religious and political subjects, though he popularized such catchwords as "Sweetness and Light." But in *Essays in Criticism* (1855) and his Oxford lectures he applied felicitously, though with an occasional lapse, a canon of appreciation based upon international standards, with the touchstone of "the grand style." W. E. Henley, George Saintsbury, R. H. Hutton, Edward Dowden, A. C. Bradley, Sir W. Raleigh, Sir Sidney Lee and Sir Edmund Gosse are other prominent names in the sphere of critical appreciation or literary biography. R. L. Stevenson, Andrew Lang, Oscar Wilde and A. B. Walkley are more notable as essayists with a personal note. And at the opposite end of the scale mention may be made of the great co-operative undertakings which were begun during the period, the *Oxford New English Dictionary,* the *Dictionary of National Biography* and the *Victorian County Histories.* They at least are certain to give it an enduring remembrance.

VIII. THE MODERN PERIOD

It must remain for a remoter posterity to pass judgment upon the English literature of 1911–26; to decide which (if any) of the authors then living were really great; to discern with certitude the trends and the characteristic colour of the age. Among those who lived through the period, it was a common opinion that it was not an age "of giants"; that the poets were not as great as Browning or Tennyson, nor any of the novelists as eminent as Dickens, Thackeray or Fielding. That opinion, as yet, can only be tentative; in the ultimate, reputations are decided by the permanent, as contrasted with the topical, appeal to the human mind and heart; and it may be that to posterity all the writers of the age will seem to have qualities and a tone in common which were not evident to themselves.

If there is foundation for the general view that there is a defect of passion in the most recent English literature and a lack of major achievements, the reasons must certainly be found in the state of thought and of what passes for thought. Men's views about the universe, the purpose of life and the nature and destiny of the soul, must profoundly influence their works of art, as well as their other actions, however frequent may be the antinomy between their proclaimed theories and their obscure but obstinate impulses. There can be no doubt that the period under review was, at least in what are called "intellectual circles," a period of confusion, of conflict, of doubt manifesting itself here in energetic pessimism, here in fatigue and apathy, here in blind hedonism, here in a desperate search for new creeds, sometimes brutally pagan. "Why should I?" was the dominant note, accompanied by a subtler "Why shouldn't I?"; and often neither awaited an answer.

FICTION

Politics, popularized science, psycho-analysis and the results of their wide study are powerfully present in a large proportion of the most intelligent modern novels, and the novel, grown polymorphous, is the characteristic medium of the age. Just as the Pre-Raphaelites segregated themselves behind the arras in flight from the smoke of the first industrial age, so certain modern novelists have declined to be affected by the smoke of modern controversy. Amongst novelists, since Meredith and Stevenson died, Joseph Conrad and George Moore were signal examples of the kind of artist who can build a raft for himself and escape from the topical welter. Conrad had his religion and his morality, "a few simple maxims," a code of honour and fidelity. He did not shrink from the major problems either; he was perennially occupied with the difficulties of conduct, the mystery of evil, the veil over the face of Destiny. Yet, as an artist, he did not primarily set out as a sublimated journalist, to mingle art with conversion and subversion, to add his word to the babel of tongues discussing property, sex, the multiple self and spiritualism. His views were manifest and set; so were his doubts; he wrote to record what he saw of magnificence, even in the form and visage of tempest and terror, in the most beautiful language he could find. Of Conrad's last works, *The Rover* (1923) was a prelude to the posthumous *Suspense* (1925), the torso of what might have been a great book, set in the Mediterranean, with Napoleon in Elba a shadow imminent over the action. He died in 1924, a Pole by birth, a seaman by training, who had achieved miracles in a tongue not his own.

George Moore, in his latest years, modified his manner and took new materials. His Irish trilogy, *Hail and Farewell* (1911–14), might be classed, by some of the friends whose words and deeds it records, with "fiction"; at least it does indicate his aims. Politics and religion may be and are touched on here, but they are raw material for art, for witty, graceful and tuneful writing; and the desire to create a finely shaped and phrased work is never subordinate to a desire to inform the reader. In *The Brook Kerith* (1916) and *Héloïse and Abélard* (1921), Moore took historical events and settings and made of them stories like tapestries in the evenness of their flow and the carefulness of their execution.

Apart from these, the outstanding novelists of their generation were H. G. Wells, John Galsworthy and Arnold Bennett. Ultimately, Wells is not likely to be thought of primarily as a novelist, and he himself has stated that he has dedicated himself to journalism rather than art. He was the Rousseau, as Shaw was the Voltaire, of his time. As a workman and a poet in prose, he never excelled his early short stories and "scientific romances," in which extreme assumptions led up to ingenious and seemingly inevitable chains of consequence. Nor did any of his later novels, in which sexual romance, contemporary politics, satire and Utopian preaching are mingled, betray quite the same care or contain quite such fine sustained passages of description as *Tono-Bungay* (1909). But *Mr. Britling Sees it Through* (1916) was a remarkable record of the effect of the War upon one man's mind, and *The Undying Fire* (1919) a very striking and successful modernization of the arguments canvassed in the Book of Job and *In Memoriam*. He was tireless as a tractarian and amongst the most astonishing by-products of his great energy and zeal was an *Outline of History* (1919–20), unique among such compilations for the raciness of its narration and the ingenuity of its summary of all the world's annals since the ball of fire first began to cool.

The reforming, or at least the protesting, bias was strong also in the novels of John Galsworthy. *The Forsyte Saga* (1922), with its sequel *Swan-Song* (1928), a collection of novels early and late, about one respectable family, was the crown of all his work. For all his air of detachment Galsworthy could not help presenting the respectable and complacent incompletely; more humour might have led to more truth; so even might a less acutely sensitive humanitarianism. But the achievement of his presentation of the mere *moeurs* of South Kensington and of country houses cannot be denied; and his writing at its best, if uniformly quiet, is extremely good.

In Arnold Bennett the propagandist instinct was much weaker, though the reporting proclivity was strong. He was never slipshod and dull, but in some of his books the chief interest lay in brilliant journalistic descriptions of superficial aspects of "West-End life," some were light-hearted farces, and the best were long-meditated and profoundly "understanding" stories about real human beings, stories in which all his talents were brought into play, but all kept subordinate to his genius. The chief of his later books, a worthy successor to *Clayhanger* (1910) and *The Old Wives' Tale* (1908), was *Riceyman Steps* (1923).

Among the younger novelists, Hugh Walpole (*Wintersmoon*, 1928, was his best book), Compton Mackenzie, Rose Macaulay, E. M. Delafield, Sheila Kaye-Smith, Francis Brett-Young, Virginia Woolf and Margaret Kennedy were widely read. D. H. Lawrence, brooding like many of them over the mysteries of sex and expounding vaguely prophetic things, showed great descriptive power and a gift for sentences like lightnings. Walter de la Mare in *Memoirs of a Midget* (1921) wrote a long modern fairy tale, like a poet's wood, full of flowers and insects, with a candle-light window at the end of a path and the constellations glittering in the dark sky overhead. H. Belloc's *The Four Men* (1912) was remarkable for its Sussex walks, its gay dialogue and its songs. E. M. Forster's *A Passage to India* (1924) was the most notable book of a maturing and slowly-working novelist, a book in which the artist brooded over the whole surface of Indian and Anglo-Indian life, showing the general through the particular. David Garnett's *Lady into Fox* (1923) and Hugh de Selincourt's *The Cricket Match* (1925) were short books beautifully composed. Among short-story writers W. W. Jacobs lost none of his old cunning and Katherine Mansfield, cut off in her youth, came, in *Bliss* and *The Garden Party*, nearer to Tchekhov, the remarkable and most celebrated founder of the art of the short-story in Russia, than any other of his many disciples. May Sinclair, J. D. Beresford, E. F. Benson, Leo Myers, R. H. Mottram, Aldous Huxley, P. G. Wodehouse, Frank Swinnerton, C. E. Montague (d. 1928) and many other names might be added to the list of the novelists, who, during the period, produced novels competent or more than competent.

It is by no means inconceivable that in later retrospect the years of the World War and the years immediately preceding and following will be held in literature to be remarkable chiefly for their poetry. There may have been few long poems of great note, but a very large volume of good lyric poetry by a very large number of

writers was produced.

One of the most extraordinary phenomena of the period was the continued fertility of the older poets. When nearly 80, the Poet Laureate, Robert Bridges, produced a new volume of poems, *October and Other Poems* (1920), a collection which showed no waning of his technical powers, experimental curiosity and gift of observation, and (more unusual still) no slacking of his emotional ardour. Perhaps the finest of all our landscape poets, and certainly one of the most careful and cunning artists who has ever worked with English words and English rhythms, he stands out conspicuously also by virtue of his perennial freshness and energy.

As Dr. Bridges at Oxford, so Thomas Hardy (1840–1928) at Dorchester continued to command the astonished admiration of his juniors. Hardy, turning to verse in his old age after a long, and nobly productive, servitude to the novel, followed up *The Dynasts* and his three earlier volumes of lyric and narrative poems with a series of volumes beginning with *Satires of Circumstance* (1914) and culminating in *Human Shows* (1925). Grim little tragedies, tender memories of the beloved dead and Wessex scenes long vanished, hard clear etchings of landscape, sea and shingle, down and puddled lane, bare tree and shivering bird; many of these written in extreme old age, surpassed the best of Hardy's previous work. These poems were marked by a great and seemingly spontaneous gift of metrical invention, a power of emotion which enabled the poet to incorporate the most unmanageable words in the movement of his music, and a quick sensitiveness, a capacity for suffering and pure joy, rare in the old.

Another prolific veteran was C. M. Doughty (d. 1926), author of *Travels in Arabia Deserta* (1888), one of the greatest books of the kind in any language, who followed up his *Dawn in Britain* (1906), with a series of long poems. *The Clouds* (1912), *The Cliffs* (1909), *The Titans* (1916) and *Mansoul* (1920), epical dramas and dramatic epics in which archaism and topicality, naïveté and sublimity are strangely mingled, are interspersed with massive passages in which the imagination ranges over all time.

Sir William Watson published one volume during, and one after, the War in which, whilst not equalling his major achievements, he showed that his talents for pithy yet magniloquent statement and for the careful polishing of verse remained unimpaired. Maurice Hewlett (d. 1923) devoted his last years mainly to poetry. His *Song of the Plow* (1916), perhaps the finest of all his works and certainly one of the few memorable long poems of the period, was a racy, vigorous, picturesque summary of English history from the point of view of "Hodge." Laurence Binyon, of the other poets of that generation, perhaps wrote the most impressive volume of War poetry, *The Four Years* (1919), in which the meditations and agonies and exaltations of the humanitarian and the patriot in face of the great calamity are expressed with power and dignity.

Noble poetry inspired by the War was also among the last work of Herbert Trench (d. 1923) and Alice Meynell (d. 1922), Mrs. Meynell's little book *A Father of Women* (1917) displaying rigid restraint, perfection of workmanship and concentrated emotion. A similar frugality was manifest in A. E. Housman's *Last Poems* (1922), its author's first collection of poems since *A Shropshire Lad* (1896), of a generation before. A few of the new poems surpassed the finest of the old for beauty and imagery and cadence, and the book was received with enthusiasm by the larger public and with reverent admiration by fellow artists. Gilbert Murray continued to add to his beautiful translations from Euripides. One volume, which contained some excellent epigrams and some spirited poems of the War, was all that the period added to the poetical works of Rudyard Kipling.

There remain a large number of poets whose reputations were not fully established in 1911, or who emerged during or after the War. The most notable progress among the former was made by Walter de la Mare, whose early books were followed by *The Listeners* (1912), *Peacock Pie* (1913) and others, including a two-volume collection in 1920. This poet usually inhabits provinces which he has made his own: woods haunted by fairies, midnight gardens and heaths haunted by ghosts, desolate shores haunted by memory. The exquisite melody and felicity of his most typical work would give him a high place among English poets; yet what is called the "major" note is not absent from his work.

The slow, vivid, sunlit style of T. Sturge Moore was again seen at its best in *The Sea is Kind* (1914); G. K. Chesterton, with "Lepanto," the songs in *The Flying Inn* (1914) and a few comic poems intensified his readers' regret that he should find so little time for verse; Hilaire Belloc added a few beautiful lyrics, notably "Tarantella," to the small body of his serious verse; and W. H. Davies almost annually delighted his admirers with a little collection of nature lyrics. Alfred Noyes, with the two first volumes of *The Torch Bearers* (1922–25), opened an ambitious epic of human intellectual development.

In 1911 there broke upon the world John Masefield's *The Everlasting Mercy*, a sensational story of conversion written in vigorous octosyllabics. It had, as lively narrative work usually has, a great success; and the author followed it up with a series of long poems on rural and marine tragedies. *Dauber* (1913) was probably the best of them, but there were good things in all. Of his shorter poems "Biography," a series of vivid pictures from memory and "August 1914," were notable.

Several of the best poets of their generation died in the War. Rupert Brooke (d. 1915), by virtue of his beauty, radiant personality and talents, became, when his *1914 and Other Poems* (1915) were published, the general symbol of youth that went into the furnace. His maturer work showed grace, wit, intellectual curiosity and a growing perception of the chief goods of life.

James Elroy Flecker (d. 1915) died of consumption at Davos, cut off from home by a ring of battle-grounds. His *Collected Poems* (1916) show that he had outgrown early affectation and uncertainty, achieved a style, pictorial and euphonious, of his own, and secured his grasp upon his deepest loves and most personal dreams. The East, which fascinated and repelled him, inspired many of his best things; it was also the source of his posthumous drama *Hassan* (1922), produced at His Majesty's theatre, London, in 1923. Wilfred Owen, killed in 1918, was unknown in life. His *Poems* (1920) were very interesting for their technical use of assonance; but his technical genius, however remarkable, was less so than the magnitude of his vision and the ardour of his spirit. Charles H. Sorley (d. 1915) was another boy who was killed on the verge of greatness; and Julian Grenfell (d. 1915), professional soldier and fine boxer, went to his death with the finest song of the War on his lips, "Into Battle" (1915).

Edward Thomas (d. 1917) had had a strange career. Before 1914 he was known as a voluminous writer and journalist whose hack work was scattered with fine descriptions of nature, but whom no one thought of as a poet. Under the stimulus of the American poet, Robert Frost, he turned, in his last two fertile years, to the making of poetry, nature poetry unique in its kind. Exact observation and record of landscape could go no farther than this; but his *Poems* (1920) would not be as fine as they are were it not for their faltering music and the positive, if quiet and melancholy, personality which suffuses them all.

Siegfried Sassoon, Robert Graves and Robert Nichols all came into notice during the War as writers of powerful and "realistic" poems describing it. Surviving, they all developed interestingly. Ralph Hodgson (*Poems*, 1917) was always a poet of slender production, but his "Song of Honour," "The Bull" and "Eve" are among the best-loved poems of the time. Edmund Blunden, mainly a recorder of rural scenes in the tradition of Morland and Constable, showed a very individual talent, and John Freeman must be singled out for the beauty of his rhythms, his spiritual strength and his landscape[1]; D. H. Lawrence (especially *Birds, Beasts and Flowers*, 1923) for his graphic power and apprehension of the crude forces of nature. Amongst others who, in few poems or many, have beautifully registered moments and moods, have

[1]Blunden and Freeman were awarded the Hawthornden prize, founded by Miss Alice Warrender in 1919 for imaginative work by young writers, the other recipients during the period being Edward Shanks, Romer Wilson, David Garnett, R. H. Mottram, Sean O'Casey, V. Sackville-West and Henry Williamson.

dreamed or reflected, are Lascelles Abercrombie, Gordon Bottomley, A. Y. Campbell, John Drinkwater, Edward Davison, Humbert Wolfe, Frank Kendon, Harold Monro, Edward Shanks, W. J. Turner, Dorothy Wellesley, Victoria Sackville-West.

The Irish poetical movement (*see* IRISH LITERATURE) begun in the previous generation by "AE" (George Russell) and W. B. Yeats, showed signs of exhaustion. "AE" wrote little; Yeats in his later poems escaped from "the Celtic twilight," abandoned the Celtic myths and discarded the languorous manner of his early triumphs for a hard, bare style in which, used for describing the outer world and the inner, he wrote poems often obscure but always full of thought, which many held to be his finest. Thomas Macdonagh and Joseph Plunkett, who died after the Easter Week rebellion of 1916, had written good lyrics; Joseph Campbell, Seumas O'Sullivan and a few others did as much; but the most notable "new" poet of the period was James Stephens, author of the delightful prose fantasy *The Crock of Gold* (1912).

BELLES-LETTRES

Criticism.—The publication of works of pure scholarship, and new editions with critical apparatus, was seriously affected by the expenses of production during the War and post-War period. Nevertheless, a considerable number of important standard editions, especially through the university presses, were published, notably Prof. Grierson's *Donne* (1912), the first volumes of C. H. Herford's and Percy Simpson's *Ben Jonson* (1925), some volumes of the *Cambridge Shakespeare* (a new text embodying the results of the bibliographical researches of A. W. Pollard and J. Dover Wilson [1920]), P. W. Chapman's exhaustive Jane Austen (1923) and T. Earle Welby's pioneering edition of Landor in process of publication in 1928. *The Cambridge History of English Literature* (1907–16) was brought to a conclusion and Prof. Oliver Elton published his massive *Survey of Modern English Literature* (1912 and 1920). Prof. Caroline Spurgeon's *Five Hundred Years of Chaucer Criticism and Allusion* (1925), in three volumes, was an outstanding example of the specialized literary research work which is largely superseding the older kind of academic criticism. Miss Helen Waddell's *The Wandering Scholars* (1927) was a delightfully discursive recreation of mediaeval life.

Among critical studies of a less encyclopaedic kind, the most substantial were done by the older men, notably Sir Edmund Gosse (d. 1928) and George Saintsbury. Sir Edmund Gosse, enjoying an Indian summer, produced numerous volumes of collected papers in which he illuminated authors and movements, ancient and modern, English and foreign, incorporating anecdote and personal sidelights with incomparable ease and grace, and delighting his readers by the suppleness, wit and pictorial brightness of his clear and idiomatic style. The most important of his later publications was *The Life of Algernon Charles Swinburne* (1917), a model of brilliant portraiture, compact narrative and sane criticism. George Saintsbury, who retired from his Edinburgh professorship in 1915, completed his edition of the *Minor Caroline Poets* (1905–21), added a *History of English Prose Rhythm* (1912), *A History of the French Novel* (1917–19) and *The Peace of the Augustans* (1916) to the prodigious pile of his historical works; and made delightful use of his vast erudition and full-stored memory in several miscellanies including two about wine. At Oxford Sir Walter Raleigh and at Cambridge Sir Arthur Quiller-Couch lectured brilliantly and published the best of their lectures. Standard lives of Keats and Byron were produced by Sir Sidney Colvin and Ethel Colburn Mayne; and theoretical treatises of a high order were Percy Lubbock's *The Craft of Fiction* (1921), E. M. Forster's *Aspects of the Novel* (1928), Christopher Hussey's *The Picturesque* (1928), and Geoffrey Scott's *The Architecture of Humanism* (1914). The death of Arthur Clutton-Brock, in 1924, prematurely removed one of the most luminous and sensible of the literary journalists who abounded in the period. Others who did good critical work were Edward Garnett, a notable discoverer of talent, John Freeman, Lascelles Abercrombie, Harold Nicolson, Gerald Gould, R. Ellis Roberts, Arthur McDowall, Robert Lynd, T. Sturge Moore, J. B. Priestley, Osbert Burdett, Lytton Strachey, Edward Shanks, Maurice Baring, Virginia Woolf; and, among critics of the drama, A. B. Walkley and Desmond MacCarthy.

Miscellaneous Literature.—The essay flourished in the period, but mainly in a modern form. The old leisurely manner was practised with perfect success by Max Beerbohm in *Seven Men* (1919), *And Even Now* (1920) and other collections. A caricaturist and parodist of genius, Beerbohm wrote with an awareness that made him extremely careful to secure the last degree of accuracy and flavour in his language, to arrange the cadence of his sentences, to exhaust his subject as it presented itself to his mind, the mind of a humorous, witty and tender connoisseur of life and particularly of highly civilized urban life. Alice Meynell also wrote essays on the major scale, profound in thought, exquisite in phrasing, austere in temper yet iridescent in hue, which posterity cannot neglect. The typical modern essayist of the time wrote regularly every week to fill a column in a daily newspaper, or a page in a weekly: the remarkable thing is the merit of much of the writing done under these limitations of time and space by such men as G. K. Chesterton, Hilaire Belloc, E. V. Lucas and Robert Lynd, and, in his last years, Maurice Hewlett.

Vivid and powerful sketches of travel were written by R. B. Cunninghame Graham and H. M. Tomlinson; Francis Brett-Young, in *Marching on Tanga* (1919), wrote a narrative prose poem on the Africa he saw during the War. With Henry Williamson in *Tarka the Otter* (1928) appeared (although the prose was rather congested) a true successor to Jefferies and Hudson. Works difficult to group are the *Earlham* (1922) of Percy Lubbock, a picture of childhood's memories of a place and people; L. Pearsall Smith's *Trivia* (1902–18), brief prose compositions full of wit, candour and pictures, and Sacheverell Sitwell's *All Summer in A Day* (1926), an enchanting piece of retrospection. *The Puppet Show of Memory* (1922) by Maurice Baring, one of the most versatile writers of his time, was an autobiographical work of great charm and interest, conspicuous among recent memoirs for its good manners. Max Beerbohm's *A Christmas Garland* (1912) was a masterly volume of parodies of modern prose writers. Among other parodists, Sir Owen Seaman having resigned the art, E. V. Knox (Evoe) was conspicuous; his work in *Punch*, together with that, both in prose and in verse, of A. P. Herbert, was a mainstay of the chief English humorous journal.

Historical works, deserving the appellation of literature, were few in the period. G. M. Trevelyan completed his Garibaldian trilogy, H. Belloc published in several volumes a controversial but suggestive *History of England*, and Philip Guedalla wrote an amusing book about Napoleon III., *The Second Empire* (1922). Sir John M. Fortescue's *History of the British Army*, concluded in 1920, more than 20 years after its inception, was a massive work written in excellent English. The most interesting work in biography was not to be found in the two or three volume political biographies, such as G. E. Buckle's continuation of W. F. Monypenny's *Disraeli*, and Lord Ronaldshay's *Lord Curzon*, excellent though several of these were, as in such works as Lytton Strachey's *Eminent Victorians* (1918) and *Queen Victoria* (1921), works tinged with irony and partial perhaps, but seminal books, because of their brevity, their concentration of the essentials of a great mass of material, the excellence of their portraiture and the impeccability of their epigrammatic and coloured prose.

DRAMATIC LITERATURE

The theatrical literature of the period under consideration is surveyed elsewhere (*see* DRAMA), but some reference may be permitted here to certain works which were widely read as well as acted. In 1911 the "realistic" movement in the drama, largely influenced by Ibsen, was in full swing. The word did not necessarily imply any approximation to reality, though it was meant to do so. What it really implied was the substitution of a novel set of conventions for a set of which people had grown tired. West-End drawing-rooms were replaced by the homes of suburban clerks; rosy sentimentalism was replaced by cynicism, a prophetic

pessimism or a detached irony of presentation; speeches gave way to silences or pregnant ejaculations; "social problems" broke in upon a theatre which had ignored them.

The born dramatist could work within this convention as within another, assuming the fashionable trappings, but relying, as he must, for his effect upon the audience, on his ability to excite and amuse them by surprise, to charm them by the presentation of "humours," to exalt them with passion and courage, to "purge" them rather than depress by the display of failure and pain; and, where a play of this school succeeded, it was not because it was arguing for prison reform, votes for women, better housing or better drains. The restrictions, however, could not endure; humanity craves in the theatre for more splendid language than it ever uses and more splendid scenes than it habitually lives among; and the end of the period saw ample signs of a return to the stage of poetry and eloquence, vivid colour and symbolism, to the universal and the particular as contrasted with the mere mundane and temporal generalization which obscures individual character without connoting anything eternal.

Chief among living British dramatists, Bernard Shaw was perennially active, moved with the times and remained obstinately himself. His method in his early plays recalled now Sheridan, now Ibsen; the wit, the paradox, the irony, the odd "angle on life" were his own. Of his last 11 plays, long and short, the most interesting were the last three: *Heartbreak House* (1919), *Back to Methuselah* (1921) and *Saint Joan* (1924). In the first picture of social fecklessness, the influence of Tchekhov and the Russians was evident; in *Saint Joan*, notable for the great trial scene of Jeanne d'Arc and the detachment with which both sides of the argument were presented, Shaw wrote a chronicle play. *Back to Methuselah*, a cycle taking five nights to play, was all his own; a prodigiously ambitious play, which opens with Adam, Eve and the Serpent in the Garden and ends with human beings "as far as thought can reach," who live beautifully and very long and are born, mature, out of eggs. The earlier and later scenes contained fine, even poetical, passages; the middle was marred by political topicality.

Sir James Barrie in *Dear Brutus* (1917), *Mary Rose* (1920) and seven short plays continued to charm a large public with his peculiar vein of humour, sentiment and fantasy, and John Galsworthy, with *The Skin Game* (1920) and *Loyalties* (1922), also did effective work in his established manner. A greater development was noticeable in the work of W. Somerset Maugham, whose long series of witty social comedies culminated (1923) in *Our Betters*, the most effective, if the bitterest, of them all. Henry Arthur Jones and Sir Arthur Pinero, the dominant dramatists of the previous period, did little to modify their reputations; and H. Granville-Barker, who had shown great promise with *The Voysey Inheritance* (1909), was largely preoccupied first with production and then with editing Shakespeare. Arnold Bennett's *The Great Adventure* (1913) was a delightful comedy; the comedies of A. A. Milne also had distinction. G. K. Chesterton's solitary dramatic work *Magic* (1913) was agreeably individual in manner.

The effort to restore "poetic drama" to the stage from the "closet" was increasingly noticeable. Flecker's *Hassan* (1922) was written before the War; Rupert Brooke was making his first dramatic experiments when the War broke out. A series of verse plays by Gordon Bottomley, the best, perhaps, being *The Riding to Lithend* (1909) and *King Lear's Wife* (1915), though retaining traces of the "reading play" had considerable dramatic power; Herbert Trench's *Napoleon* (1919) was on the verge of greatness; and there was grace and charm in Clifford Bax's *Midsummer Madness* (1923), a ballad opera to which C. Armstrong Gibbs wrote music. Other dramatists conspicuous in the period were Noel Coward, Clemence Dane, John Drinkwater, St. John Ervine, "Ian Hay," John Masefield, Alfred Sutro and Israel Zangwill.

ENGLISHRY, the process by which William the Conqueror protected the lives of his Normans. If a stranger was found slain, and the slayer was not produced in court, he was presumed to be a Norman, and the hundred was fined accordingly, unless it could be proved that he was English. Englishry, if established, excused the hundred. It is said that Cnut protected his Danes in a similar manner. Englishry was abolished in 1340.

See Pollock and Maitland, *Hist. Eng. Law*, vol. i. 67.

ENGLISH-SPEAKING WORLD: ORIGINS, EXPANSION, RELATIONS AND PROSPECT. The following pages divide into nine sections:—I. Origins up to 1606: the island, its breeds and the language. II. First expansion in the 17th century: Puritanism and Sea-Power. III. 1674–1782: Making and breaking of the Old Empire. IV. After 1782: Britain's vitality. V. Ireland's increase, disaster and exodus overseas. VI. 1790–1928: Growth and transformation of the United States. VII. A general view of English-speaking life. VIII. "Towards 300,000,000": the future and its problems. IX. Conditions of Moral unity and parallel action: the "Key of the World."

I. ORIGINS UP TO 1606: THE ISLAND, THE BREED AND THE LANGUAGE

When Shakespeare and the Authorized Bible revealed the incomparable resources of expression attained by one modern language, its speakers were still but a small handful of the human family; and nearly all local to a peculiar nook of ground. Nothing augured the destinies of their tongue. Then, it was used by little more than 5,000,000 persons altogether. To-day, multiplied forty-fold in a short period of historic time, it is the principal world-language; already familiarly spoken by about 200,000,000 people and sure of large increase. Then, though its seafaring epic had just begun, it was still confined almost entirely to one island broken off narrowly from the continental mass of Europe. Now, this language, and this only, has been carried through all the oceans and spread round the globe. The results have appeared in our day as a paramount force of world-history. With political and social diversities of every kind, widely-separated communities have speech and literature in common; their general conceptions of freedom and law and ethics are the same. The relations of this vast array of lands and peoples are of unsurpassable moment.

"Language" and "Race."—The growth of the English-speaking world is more often marvelled at than understood as a process of historical geography. At no phase can it be explained by dwelling in the older way, with almost exclusive emphasis upon the "Anglo-Saxon idea." From that standpoint only, the biggest developments and the future problems cannot be realized at all. Language and race may be two very different elements in combination. There is no such thing known as a "pure" unmixed breed. Every great language covers more or less a variety of racial origins. This is a principal key to modern historical work. None the less is England the mother of nations—a "little England," indeed, but a mighty mother.

Formation of the Nucleus.—There were ages when not even the island was. Ancient waters hid its foundations: "here where the long street roars hath been the stillness of the central sea." Through another age after the island rose and first was peopled,

no England was. No more than an unknown westward continent was yet named America. Primitive races whose languages have left no sign, though some anthropologists believe that they survive largely in the physical substratum of the insular breed, lived there, before history dawned, for a longer period than any later occupants. The Celts came, conquered, mixed. They made "Britain." The Romans followed and remained for four hundred years—a period nearly as long as from Columbus to this day—building their solid quays, their gated cities, their linking highways; leaving some of the mixed blood of their legions in the veins of the natives. They went. Already some of the racial factors still entering everywhere into our subject were formed before there was any trace of English in England.

The rudiments of our modern world-tongue had not reached the country destined to receive and transform them. Then from the fifth to the tenth centuries, "English-speaking expansion" began as a new colonization of the island—like a miniature America—by north European tribes. By successive waves the Germanic and Norse invaders—Angles, Saxons, Jutes, and later Scandinavians—swept in and changed utterly the breed and speech of the larger part of the land which had been Britain; while, in the latter centuries of this period, the swoops and settlements of the Vikings came round to Ireland and though in the end less successful there had a far-reaching influence on its future. The terms "England" and "English" do not come into use for a long time. First, towards A.D. 1000 under the Danish domination, they seem to have implied as against the new invaders, a common consciousness of the Anglo-Saxons formerly at feud with one another. Secondly, and very soon (A.D. 1066) from the Norman conquest onwards, "English" took in the Danes as well, against the new masters. For a generation or two, by distinction, the Normans of the ruling caste even though born in England called themselves "French." This caste itself sprang from no pure Norman aristocracy as supposed in centuries afterwards by the vanity of their real and fictitious descendants, but mainly from a medley of adventurers syndicated for profit and drawn to the Duke's banner by his wide advertisement of expected spoil. William's host was a Joint Stock company in armour. The consequences are in the life and language of America to-day no less than in the substance and soul of the original islands.

Late Creation of English: the Newest Modern Language.—Though "English" had been a name in use for a couple of generations before the Battle of Hastings, as yet the tongue we mean by it was not. It was gradually, wonderfully shaped, in the next five centuries from the Conquest to Elizabeth. Chaucer shows change and enrichment advanced more than mid-way. Words from the French swell the vocabulary. This digestive habit easily leads under the Renaissance to ample assimilation of Latin forms. Thus we acquired the present inheritance of all the English-speaking and English-writing communities—a medium capable of magnificence, power, subtlety, but of all homeliness, humour, tenderness; full of practical force. It kept a great simplicity in inmost nerve and character, and controlling elements. For all the splendour, you have mostly words of one syllable in:

> "Is this the face that launched a thousand ships
> And sunk the topless towers of Ilion."

Bunyan writes line after line in words of one syllable. But Shakespeare suggests in one sentence the whole range and blending and depth of tone, of this orchestra:

> ". . . not poppy nor mandragora,
> Nor all the drowsy syrups of the East,
> Shall ever medicine thee to that sweet sleep
> Thou owest yesterday. . . ."

Burke breathes eternal regret: "What shadows we are and what shadows we pursue." Wordsworth spiritualizes a loveliness of imagination:—

> "The light that never was on sea or land,
> The consecration and the poet's dream."

And an Abraham Lincoln creates the Gettysburg speech where the eloquence of a prose, brief, pure and immortal, remains even after the World War the utterance in modern centuries most worthy of great nations remembering their dead. But the book of books, the English-speakers carried with them when they began to spread overseas was the Bible in the Authorized Version, chief treasury of the language containing all the qualities remarked upon above, and others of its own:

> "I will praise thee; for I am fearfully and wonderfully made: marvellous are thy works."

Note that since Alfred's day the immense growth by verbal immigration of the language itself while yet local only, was like a premonition of the subsequent expansion and assimilativeness of the race. Another thing was preparative. The English themselves were of mixed Germanic-Celtic blood representing racial elements as different at first as say Swede and Slav in the present white population of the United States. As Sir Walter Scott puts it, Scottish Lowlanders for long regarded Gaelic Highlanders much as Pennsylvanian settlers used to regard Cherokees.

The First Five Millions; and the Larger Rivals.—Thus much for things as they had come to be when the great dispersion began. Estimates of the population of England at the time of the Conquest vary and are all very uncertain. The likeliest number in 1066 is given as about 1,500,000. There is no more certainty about whether the rate of increase afterwards in the middle ages was fairly good or very slow. There seems no doubt that the Black Death (1348–50) meant a heavy throwback though the chronicles exaggerate. Whether one third of the people disappeared or but one tenth (the lowest reckoning) we do not know. But it is probable that in the century and a half between the great pestilence and the height of the Elizabethan period the population doubled itself and increased as much in prosperity. It is thought to have numbered, however, only about 5,000,000—in Scotland at the same time there may have been not much more than half a million of English speakers and in Ireland less than 100,000—when Queen Elizabeth died in 1603.

What were the chances of the insular five millions in the coming struggle of nations in the 17th century for sea-power and colonies? To almost any foreign eye at that time, the chances would not seem considerable. The power of Spain though somewhat past its zenith seemed immense in both hemispheres. The French were already about 16,000,000 strong, over three times as numerous as the English and increasing faster. The Dutch were going far ahead, as for long they were to continue, in maritime and mercantile progress. The English until rather recently had not even begun to be in the forefront of navigation and world-adventure though the discovery of America was destined in the very end to have greater consequences for them and their posterity than for all other nations put together. When Shakespeare went to school there had been nothing to compare with the achievements of Columbus, Vasco da Gama, Magelhaens or Jacques Cartier. John Cabot was a Genoese though he sailed for the English King. For over two generations after that discovery of Newfoundland nothing much happened. True that a few English fishermen made the Atlantic passage more or less regularly to fish like others on "the banks." That, in a way, was a small beginning of the expansion but there was still no settlement. Then the epic opened when Drake went round the world and Sir Humphrey Gilbert with far larger though dreamy political ideas, the real pioneer of the English-speaking world overseas, obtained in 1577 his general patent of colonization. In June 1583 he with his intending colonists sailed from Plymouth for Newfoundland—"which was but 700 leagues from our English coast." He took formal possession and set up a pillar on which were engraved the arms of England. But ill-luck dogged him. After 17 days, he had to sail away again leaving nothing but the pillar behind him. He declared that they would all return "royally in the Spring." But he perished in his little "Squirrel"—10 tons!—having been heard in the storm to say a word that was to be in the future the soul of more than he knew: "We are as near to Heaven by sea as by land."

Raleigh followed. The "growing spots" were not to be in Newfoundland but amidst more favourable scenes on the Atlantic

coast of the American mainland. In the year after Gilbert went down, "Virginia" received its name but by no means its being. For more than two decades yet attempts at "plantation" would not root; but neither, now, would the dream die.

II. FIRST EXPANSION IN THE 17TH CENTURY: PURITANISM AND SEA-POWER

The 16th century gave place to the 17th. The old Queen passed away. Three years after, while Shakespeare was writing "King Lear," the Virginia Company was created on a more lasting foundation; and in December 1606 the first founding emigrants of the English-speaking world went out. Their vessels were the "Susan Constant," 100 tons, the "God Speed," 40 tons and the "Pinnace" 20 tons. In the spring of 1607 they found the James River and sailing upwards they fixed upon a landing place where six fathoms of water were so near to the shore that the ships could be tied to the trees. Jamestown, inaugurated on May 13, 1607, became memorable as the spot where the English-speaking race cast first root overseas and where the United States began.

The First Colony: Foundation and Spirit of Virginia.—The emigrants proper on embarking in the Thames numbered 143. Amongst them Captain John Smith was worth a host. The rest as a whole were an unlikely lot—for the most part ne'er do wells "packed thither by their friends to escape ill-destinies." In America, they were miserable. More than half died in twelve months, from privation and sickness and thriftlessness. Despite Smith's vigour this enterprise threatened to disappear like Raleigh's attempts in the generation before. The company sent out more colonists. But in the third summer, 1610, all agreed to quit the place. Lord Delaware's saving reinforcements came in the very nick of time. In 1611 a company of 650 new colonists arrived. After that—by coincidence it was the year when the Authorized Bible appeared—there was no more talk of abandoning the English-speaking settlement in Virginia. Let us follow its better, though not easy, fortunes there before turning to events northward. Plantations extended along the river-lines. Trade grew. There was continuous infiltration of emigrants from England. It had been hoped at first that the colony would supply shipbuilding materials; for them England then depended insecurely on the Baltic. But this was not to be the business of Virginia. Tobacco became its flourishing staple. Within one decade after the James River settlement was saved for good, 20,000 pounds of the leaf were annually exported when the new habit of smoking was spreading in Europe with amusing rapidity. In 1619 as many as 1,200 new colonists arrived. Virginia was growing like the tobacco.

Above all, in that same year occurred at little Jamestown one of the signal events in history foreshadowing the political future of the English-speakers overseas and revealing the chief secret of their free vitality. A parliament "broke out." The Virginia House of Burgesses was the first representative assembly yet seen outside Europe. In the same place about the same time negro slavery was introduced. How the colony went forward henceforth the figures of population estimated at irregular periods may indicate. In 1622—when King James at home was suppressing his parliament in the Stuart temper that would lead at last to Civil War—Virginia had 4,000 inhabitants. In 1649 when Charles the First was executed at home, there were 15,000. Another fifty years or so brought the number of whites up to 50,000 (and there were 20,000 blacks) when the 18th century began.

"New England."—But meanwhile ran parallel the sterner story of "New England." Captain John Smith gave it that name when he explored and mapped its coast in his last voyages after quitting Jamestown in its dismal days. On his map was a spot he called Plymouth. Here the Puritan pilgrims landed in 1620—the year after a parliament "broke out" in Virginia. We see already what different political and religious forces were bound in the end to converge. The sequel in the north is a tale so well-known that we need only indicate here at what rate the English-speakers grew in this hardy quarter. The "Mayflower" brought a hundred souls, men, women and children. More than half died in that first winter. Reinforcements were scanty in the first hard years. In 1622 only 35 new colonists arrived, and in the next year 96. Yet the roots were tough. The Puritan settlement numbered only about three hundred persons in 1630 at the end of its first decade; but at the end of the next, in 1640, the population of Plymouth Colony was 3,000; and so throve onwards.

Now, rather, take New England as a whole. Within a quarter of a century from the voyage of the "Mayflower" the Puritan emigration had brought the total number of settlers in the five original colonies up to over 25,000. And of these 5,000 had been born in New England (Fiske). An English-speaking and American-born generation—this as in Virginia was a new kind of fact in the world and one of endless significance. This lean, sinewy race threw itself with equal vigour into agriculture and sea-faring, religion and politics. Attracting the strongest fibre of native English character the Puritan colonies hardened it again and quickened it. Probably they had more continuous practical energy than any stamp of men seen up to then. By 1720, a century after the arrival of "the first hundred," the English-speakers of New England numbered about 100,000.

The Atlantic Chain of Settlements.—Meanwhile the Middle States and the southernmost Slave States had come variously into being. Pennsylvania amongst single colonies was second in strength. Along the Atlantic seaboard of the northern part of the New World, now stretched for more than a thousand miles, the English-speakers.

We must look back for a moment on the chequered interval in the mother-islands. There was no systematic self-conscious creation of Empire at any time. The French always were superior in logical plan. English ideas were as irregular as Shakespeare compared with Racine. But they left more and more room for individual initiative and free combination. They regarded colonies not only as reformatories for the evil-doing and sanatoria for the unfit—Virginia's early days suffered from this view as we have seen—but also, to quote Hakluyt himself, as places of safety, "if change of religion or civil war should happen in this realm." Religious change happened in the consciences of a very large part of "this realm" and civil war rending England nourished America.

Cromwell and the Connecting Seas.—That Civil War threw up Cromwell—"the greatest prince that ever ruled in England." This was the real turning point for English-speaking expansion. We must remember what had been taking place apart from the American mainland. Barbados and other sugar-islands had been acquired. When Jamaica was won from the Spaniards for the Lord Protector by Penn and Venables and settled soon after, England became predominant in the West Indies. This meant maritime and mercantile advance of the first order. The mighty thing was the creation by Cromwell of his new sea-power. To most foreign eyes, what could have seemed more audacious than his attempt, or more improbable than its success? The Dutch advantage at sea was overwhelming. The Puritan dictator first sought security by a project of alliance between the two Republics, the insular Ironsides providing the military arm: leaving Holland its naval supremacy. The confident Dutch declined the plan with some scorn. They did not know their man. When the struggle opened they relied, as well they might, on their wealth to outbuild him. But first he passed his Navigation Act striking at their carrying trade. Then by heroic finance, based on sweeping confiscation of Royalist estates, he launched in a few years over 150 warships; and his fleets at his death, manned by 22,000 men, had already reduced the Dutch from supremacy to doubtful equality, bound henceforward to sink slowly into inferiority. Through the two centuries and a half following, the sea-power of the English-speakers (the American Colonists playing their full part in various ways for several generations) rose to a wider mastery of the great waters than any age before had seen.

The conditions for the creation of the English-speaking world as we see it to-day were established. When in 1674 New Netherland became New York and New Jersey for good, the Dutch prospects in colonial rivalry were extinguished. But France remained and her spirited and highly organized people at that time were still four times as numerous as the English people. France would prove the formidable antagonist of the future.

III. 1674–1782: MAKING AND BREAKING OF THE "OLD EMPIRE"

Glance for a moment at the effect of these historical influences upon emigration across the North Atlantic. Every defeat or oppression of any religious cause in western Europe brought further reinforcements to the colonies. The Puritans were followed by Royalists, Catholics, Quakers; and, after the rampant orthodox reaction under Charles II., by Nonconformists of all sects. Transportation of criminals—many of whom would not be considered such under the humanized codes of our day—played its part though a minor one. When Cromwell sent the Irish to Barbados and elsewhere, they became indeed English-speakers in spite of themselves, but he set up a movement which was to have its Nemesis.

America and Mingled Immigration.—In the 18th century another factor became very notable. Penn opening his colony to all comers whatever their creed, if otherwise suitable, had drawn in already Welsh Baptists and Scoto-Irish Presbyterians. From the end of the 17th century, the emigrants from Ulster, and their kin from Scotland itself, streamed for generation after generation into North America. Their tough fibre, keen intelligence and concentrated practical energy, added a colonizing force second to none in worth. Impossible to overestimate its importance in American history. It is reckoned that at the time of the declaration of independence the Scoto-Irish and the Scots proper of similar type, formed one-sixth of the entire population—that is they were about half a million—and in the struggle they were the most vehement and unyielding of all. Already in North America, an "English-speaker" might be, and often was, something very different in blood, temperament, thought, and character from the average man of purely English race.

But this indeed was to be more and more the process of tremendous significance in America. First by thousands, and then by hundreds of thousands, and then by millions upon millions down to this day, it was to make "English-speakers" out of emigrants not derived from the "Anglo-Saxon" stock—that name itself a blurred generalization—and often having little affinity with it. The Dutch and Swedish strains had been there from old time. Germans came in numbers when Pennsylvania was opened on inviting terms, and they clung to the language and ways of their old Fatherland. Next French Huguenots came when Louis XIV. revoked the edict of Nantes. Fleeing on the contrary from Protestant oppression, the Celtic and Catholic Irish were already present though as yet not in large numbers. And the Jews had already made their appearance. When Oglethorpe founded the thirteenth colony, Georgia, as late as 1732, the settlers included Jews from most countries in Europe, but also more Germans (in great part from Salzburg, Bohemia and Moravia in the Austrian dominions) and Scottish Highlanders as well as English folk of every sort.

Yet "Basically English."—Despite all mingling and blending so far, let us make no mistake. England itself had been throughout as from the beginning the main reservoir wherefrom flowed the widening currents of American life. The pioneer race remained preponderant, no matter how deeply the numerous admixtures just described might modify the temper and traits of the social aggregate. Professor Beard puts it: "Beyond question the overwhelming majority of white people in the colonies were of English descent; the arrangement of classes was English; the law which held together the whole social order was English in essence. . . . The language of bench and bar, pulpit and press was English. . . . Whether for praise, blame or merriment, colonial America was basically English."

English-Speakers and France: the Decision (1756–1763).—For the affair of English-speaking expansion in the world the Seven Years' War was by far the largest event since the rise of Cromwell's new sea-power. With the opening of the final struggle between Great Britain and France, for the control of the whole American interior from the Mississippi Valley and the St. Lawrence to the Pacific Ocean, the issue was almost predestined. The little island at home, swarming at that time with every kind of vitality and ability—in literature, science, art as in trade, politics and arms—remained an impregnable stronghold of sea-power. The English-speakers on both shores of the Atlantic and in every field of adventure had at their head at last a leader aquiline in genius as in feature, Chatham. "England has been a long time in labour but she has brought forth a man." All put together this rising race—four-fifths of it then of the breed that made the language—were still so far exceeded by the numbers of the French in Europe that the situation always was a cause of anxiety. But France had the Pompadour at her head and Frederick the Great as well as Chatham on her hands. Above all—no single statement in this article is more enlightening—across the Atlantic, the ratio of English settlers to French was already (1756) at least twelve to one; some estimates make it as great as 15 to one, and it may have been so.

How had the relative positions of the rival colonists come to stand as it did? Long ago French enterprise had been earlier and more active in the field. There seemed no reason why that brilliant and teeming nation should not achieve colonial and maritime domination and a new world-empire. But European aims and a singular attachment to native soil forbade concentration upon overseas policy. When the power of Louis XIV. was at its zenith in the opening years of the 18th century he had less than 10,000 French-speaking subjects in North America, and even when the Seven Years' War (1756) began there were less than 100,000 in Canada.

By contrast what had been happening in the Thirteen Colonies? We have glimpses at irregular periods of the growth of their white population:

1688	200,000
1717	375,000
1756	1,150,000

If this breed was at least twelve to one in numbers, against the North American French-speakers, its resources were still larger in proportion. New York alone was more than equal in man-power to all the French settlements put together. So at the end of this World War (waged simultaneously in three continents) French aspirations were eliminated from North America in 1763, as Dutch sovereignty about 90 years before had been removed from New York. An "English-speaking world," politically undivided was established, but even now it held less than 12,000,000 English-speakers all told (while defeated France contained 20,000,000 people whose formidable possibilities were soon to shake the earth) but their position in world affairs was magnificent. The bulk of all North America was solidly in their hands; they were predominant in India; all the oceans were open to their maritime and commercial ascendancy. New England ports like Salem flourished on the India trade like the ports of Old England.

The Great Disruption as a Double Stimulus.—We must not attempt here to discuss the causes of the disruption of the Old Empire nor to follow the course of the War of Independence. France had her *revanche* at Yorktown but against the maritime coalition British sea-power in 1782 survived the deadliest of all its hours of peril; and the island retained Canada. In a very few years more, the American Union was constituted and the French Revolution broke out. The great disruption soon proved not to be a check but a stimulus in many ways to the growth of both branches of the English-speakers. In population and territories, for nearly three generations yet, and still more in commerce and wealth, the mother-island, not only unexhausted but more prolific inventive and successful than ever, was to remain preponderant. Only now began the astonishing movements which in another hundred years were to establish the English-speakers in two more continents. In the continent first settled, the progress of the new American Republic was to increase their numbers to a degree beyond imagination at that time. After the foundation of the United States, and just before the Revolutionary and Napoleonic Wars, there were in 1790 not much more than about 16,000,000 English-speakers in the world at the most, including nearly 4,000,000 in North America (but excluding those in the British islands using only Gaelic or Welsh), while there were over 26,000,000 persons to whom French was native, including its element in

Switzerland, in what we now call Belgium, in Canada, Louisiana and the West Indies. It is now convenient to divide the subject into two parts which will be brought together in a final view.

IV. AFTER 1782: BRITAIN'S REDOUBLED VITALITY

Take first the movement under the British flag. Only outstanding events and corresponding statistics need mention. The rest will be found under the heading BRITISH EMPIRE and in other articles relating to the mother-islands and to the British dominions. That the old country began to build up a new empire—in the sense of new colonies of her children, extending to shores far more distant than the trans-Atlantic seaboard—was and remains, so far as concerns increase in the number of English-speakers, the smaller part of the process. But the results are already big and still progressing, while their origins are as vivid in appeal to historic imagination as the beginnings of Virginia and New England.

New Colonies in Three Continents.—First Canada. It is estimated that after the separation of the Thirteen Colonies from the mother-country, over 40,000 American Royalists, for the most part of picked quality, went to what are now Nova Scotia, New Brunswick, Cape Breton Island and Ontario; and thus began the building up of the present English-speaking majority in the Canadian Confederation. Next Australasia—at the extremity of remoteness on the underside of the planet. A Frenchman wrote in the year of Yorktown that Captain Cook had sailed far south to redress the British loss in one continent by discovery in another. The English never were so planning. Their idea then was to keep up traditional transportation and to find fresh ground for the fruitful banishment of offenders. Instinct was true as usual. A penal settlement might grow into a colony. Accordingly in May 1787 Captain Philip with about 600 male and 185 female convicts sailed for Botany Bay but chose instead, at what is now Sydney, "one of the finest harbours in the world in which 1,000 sail of the line might ride in perfect security." More than half a century later began the settlement of New Zealand—the real *ultima Thule* of white home-making. By degrees were founded round the present island-continent of English-speakers all those colonies now joined together in the Australian Commonwealth. Meanwhile, the Mother Country had planted a community of its tongue and breed in yet a third continent—at Africa's southern extremity, annexed during the Napoleonic Wars. There in 1820, five years after Waterloo, the first British immigrants arrived. They, and those since added to them, have lived side by side with the Dutch through many vicissitudes; and though to-day they are a little less than half the white inhabitants of the South African Union, their greatest of world-languages is familiar to a majority.

We cannot mention here the dependencies—the "stepping stones" and stations strung along many shores and through all seas—where English is the official language and more or less spoken. Enough to say that to-day (within the British Empire but outside the mother-islands) in Canada, Newfoundland, the West Indies, in the Australian Commonwealth and New Zealand, in Southern Africa and more parts of that continent, and in other sundry places, there are at the hour of writing (towards the end of 1928) nearly 20,000,000 of white people to by far the greater part of whom English is native while to the rest it is a language of daily use.

Great Britain: New Numbers and Overflow.—But in the same period of nearly 150 years (1783–1928) covered by the preceding paragraphs, the development of population in Great Britain itself has been the most surprising thing ever known in equally limited circumstances of time and area. There are nearly three times as many native English-speakers in Great Britain as in all the rest of those territories—comprising a quarter of the earth and of its inhabitants—which are part of that entire British system, beyond all parallel not only in geographical range and total extent but in every kind of variety political and racial, religious and linguistic, climatic and economic. Let us look at the tables. As Great Britain and Ireland followed courses at first somewhat similar but afterwards tragically different for the smaller country, we must exhibit their statistics separately:—

	Great Britain	Ireland*
1760	8,100,000 (estimate)	2,900,000 (estimate)
1770	8,800,000 ,,	3,000,000 ,,
1780	9,400,000 ,,	3,200,000 ,,
1790	10,200,000 ,,	4,000,000 ,,
1801	10,900,000 census	4,700,000 ,,
1811	12,600,000 ,,	5,500,000 ,,
1821	14,400,000 ,,	6,800,000 census
1831	16,500,000 ,,	7,800,000 ,,
1841	18,700,000 ,,	8,200,000 ,,
1851	20,900,000 ,,	6,550,000 ,,
1861	23,100,000 ,,	5,800,000 ,,
1871	26,100,000 ,,	5,400,000 ,,
1881	30,100,000 ,,	5,200,000 ,,
1891	33,400,000 ,,	4,700,000 ,,
1901	37,500,000 ,,	4,500,000 ,,
1911	41,100,000 ,,	4,300,000 ,,
1921	43,000,000 ,,	4,500,000 ,,
1928	44,500,000 (estimate)	4,300,000 (estimate)

*Before the census of 1821 no certainty exists about the numbers of the Irish population. There are wide differences in the estimates. The figures above are suggested by the present writer on the basis of McCulloch "Statistical Account of the British Empire" (1839) and George O'Brien "Economic History of Ireland in XVIII. century" (1918).

Machine-Revolution and Swarming.—Each of these columns is of extraordinary meaning. Take the British column by itself. In 1760, while all the English-speaking peoples are still politically united, Great Britain is at the beginning of the industrial revolution. Her total population has not increased by much more than a couple of millions in a century and a half since Shakespeare's last years when the first small settlements of the race overseas had just begun in North America. (Remember that in this same year when George III. succeeded to the throne the total number of all the English-speakers overseas was also not much more than a couple of millions.) Now began that swarming of life at home which the whole of English-speaking life overseas did not for a long time overtake. The means of increase were created when machine invention began and steam as a driving-force was soon added. Town-life thickened where it never had been before. First, manufacture was revolutionized, then transport. Britain led the world in prodigious innovation. The population doubled in 50 years or so, during the earlier era of the manufacturing revolution. After that, the transport-revolution by means of railways and steam-shipping came into full swing and in another ordinary lifetime the population doubled again (from 16,500,000 souls in 1831 to 33,400,000 in 1891). In the shorter period since then, and especially under the influences of the World War, the rate of increase has slackened notably but the further absolute addition has been very large (from 33,400,000 in 1891 to 44,500,000 in 1928). Britain to-day is less in geographical size than a 30th part of the United States proper, but the number of its inhabitants is still nearly equivalent to 40 per cent of the population of the whole American Union. England, Scotland and Wales together are not quite equal in area to the States of New York and Pennsylvania put together; but in their crowded aggregate of human life, they very nearly equal the combined inhabitants of the New England States, New York, New Jersey, Pennsylvania, Ohio, Illinois and Michigan.

And yet in spite of this accumulation at home the originating island through the greater part of the period (1760–1928) dealt with in this section supplied to the United States, chiefly—in a lesser degree to Canada and Australia—millions and millions of nation-building emigrants. We shall get a clearer view of this process when examining presently the giant growth of the Great Republic.

V. IRELAND'S INCREASE, DISASTER AND EXODUS OVERSEAS

The Irish figures have an utterly different meaning both in their rise and fall. But their fall at home, terrible in its causes, was the next most powerful factor in promoting English-speaking expansion throughout the world. Here we note a curious thing. The effect of American influences on the economic and social life of Great Britain and Ireland has been enormous. The American

potato revolutionized Ireland twice, first by stimulus, then by destruction; American cotton and Eli Whitney's cotton-gin turned the old Slave States into the great source of raw material for England's chief textile industry; and, long afterwards, the flood of cheap American wheat swamped the former position of British agriculture.

The American Potato Revolutionizes Ireland.—Of these influences the most powerful historically for good and ill was the strange factor of the potato in Ireland. As every one knows it was introduced by Raleigh into his estates in the county of Cork about 1610 (when the question on the other side of the Atlantic was whether Virginia should be abandoned). Within two generations this facile product offering in good seasons a large yield from little labour became the common food of Ireland. The oppressed and neglected people, growing accustomed to the poorest nourishment in wretched mud-hovels, married young and bred rapidly—encouraged by religion as in French Canada and Italy. Shortly after the time when American Independence was won, the overgrowth of population in Ireland began to be abnormal and even startling as the figures show.

The land more and more subdivided began to swarm with small holdings and young families, more and more dependent on the potato, raised with ease and in quantity on almost any sort of soil. But it was a hazardous crop periodically subject to failure. Minor famines preceded the great one, but their warning was not learned. In 1845 the Irish population had doubled itself within the memory of many persons then living and had reached a figure of nearly 8,300,000 souls. Then Ireland was swept by a catastrophe comparable with the general calamity of the Black Death in western Europe during the 14th century and with the devastation of 17th century Germany by the Thirty Years' War. "The priesthood favoured early marriages. The Irish policy favoured subletting. Early marriages and sub-letting combined made for an over-rapid increase of population. . . . Nearly three and a half millions of the people lived in mud-cabins, badly thatched with straw, having each but one room and often without a window or a chimney" (Right Hon. Sir James O'Connor, *History of Ireland, 1798–1924*, pp. 275–282). In these circumstances of life on the margin of subsistence with no resource in an evil day, the terror came like the potato itself from the other side of the Atlantic. The terror was the disease soon known as the blight, turning in a few days the expected food to rottenness.

The Blight and the Flight.—The blight first appeared in America in 1844. The year after, it attacked all western Europe. Twelve months later, in the black summer of 1846, it destroyed utterly the food-basis of the majority of the Irish peasants on their crude little plots. Probably the population had reached its maximum on the eve of inconceivable ruin and may have numbered very nearly eight and a half million. The sequel was exodus. Within one decade afterwards a quarter of the whole Irish people as numbered before the blight—that is to say over 2,000,000 souls—emigrated, mainly to the United States. That outpouring did not cease. In the two generations between the Great Famine and the World War well over 5,000,000 emigrants quitted Ireland—an enormous number relatively to so small a country—and nearly four-fifths of them, with all their promise of large posterity in any new home, took ship for the United States. Many of them, especially in the original years of the great flight, were Gaelic-speaking.

Thus by strange fortune the Irish disaster played a great part in English-speaking expansion.

But Total Irish Emigration much less than British.—Still it was not the main part. Great Britain itself, the mother-island of the language, the law, the systems of popular government, the machine-revolution and the sea-power, still sent out overseas the largest nation-building forces, though not so large a proportion of them went to the United States. Great Britain continued to increase while Ireland diminished. If Irish emigration in the whole century between the end of the Napoleonic wars in 1815 and the outbreak of the World War in 1914 amounted to something more than a total of 5,000,000 souls, the number of English and Scotch emigrants, with the small Welsh contingent was well over 9,000,000. Most of them were the pick of the stock. Agriculturists and artisans, they left their native fields and towns to "better themselves" as the word went. After the close of the American Civil War the Irish Celtic emigrants soon ceased to be in a majority. By comparison the English and Scotch settling overseas outnumbered them more and more thenceforward—by two to one for instance in the decade 1871–81, by three to one in the couple of decades thereafter, and so onward in rising proportion. There has been nothing at all in history like England and Scotland together as a reservoir of human vitality maintaining at home on an area considerably less than half the size of France a ceaseless increase of population, yet as ceaselessly supplying streams of life to those new nations across the ocean whereof one has become far mightier than the mother.

VI. 1790–1928: GROWTH AND TRANSFORMATION OF THE UNITED STATES

We turn now to that unparalleled factor which in relatively recent times has advanced by leaps and bounds the numbers of the English-speakers (multiplied owing to the absorption of masses of other breeds) and has raised them to their present predominance in white civilization. That factor has been the growth, during the 19th century and since, of the United States, where reside to-day nearly two-thirds of the whole aggregate of nearly 200,000,000 using the same great language. But for this, the present vogue of that tongue would not have existed. When George Washington died in 1799 the total of English-speakers in North America was about the same, a little over 5,000,000, as in England when Shakespeare died. By 1928 the number had risen in the American Republic alone to over 120,000,000. It is of extreme importance to realize clearly by what variety of racial contributions this enormous aggregate has been so rapidly created.

America's Thirty-fold Increase.—For convenience, let us take first a statistical view of the American process corresponding to the figures previously given for Great Britain and Ireland. The population of the United States from its federal beginnings mounted up decade by decade until our own time in the following manner:—

1790–1928: Population of the United States

1790 . .	3,929,214	1870 . .	38,558,371
1800 . .	5,308,483	1880 . .	50,155,783
1810 . .	7,239,881	1890 . .	62,947,714
1820 . .	9,638,453	1900 . .	75,994,575
1830 . .	12,866,020	1910 . .	91,972,266
1840 . .	17,069,453	1920 . .	105,710,620
1850 . .	23,191,876	1928 (end)	121,000,000
1860 . .	31,443,321		

Nothing like this 30-fold increase in little more than four generations has ever been known. The interacting causes, American and European, political and economic, are so various and complex, that not all of them can be examined here. The chief forces are evident and some of them already have been explained in the preceding sections.

Before Mass-Immigration.—Most evident in the first half-century (1790–1840) after the American Union was constituted, was the increase in the native-born stock which seems to have more than trebled itself in the period. The westward movement, from the Atlantic fringe to the Mississippi and beyond to the Pacific coast, was only beginning; the scope for fresh settlement and enterprise unbounded. But, for reasons beyond the scope of discussion here this rate of reproduction by the American-born did not continue. Immigration became the greatest developing force towards the middle of the 19th century—that is at a time well-recollected by many persons still living when the present century opened.

Influx and Assimilation.—It is supposed that from the end of the War of Independence to 1830 less than 400,000 immigrants altogether entered the United States of America. They were a minor though increasing factor for yet another decade. After that, the deluge. The movement in the mass is best shown in tabular form over-leaf:—

1830–1928: Immigration into the United States

1831–40	600,000
1841–50	1,700,000
1851–60	2,600,000
1861–70	2,300,000
1871–80	2,800,000
1881–90	5,300,000
1891–1900	3,800,000
1901–10	8,800,000
1911–20	5,500,000
1921–28 (lowest estimate)	3,200,000
Total	36,600,000

From this prodigious influx in less than one century, perhaps over two-thirds of the existing white population of the United States are mostly or partly derived.

There we touch on the most extraordinary part of the subject. The United States became a machine for turning foreign-speakers by millions upon millions into English-speakers. This meant a profound change from the time when the constitution was adopted and the American Union established. Then 90 per cent of American whites were of British race and 80 per cent of the English race proper. Remember well, that in the period covered by the table above the immigrants into the United States from England, Scotland, Wales and Northern Ireland—the elements strictly called British—have been less than an eighth of the whole. Those from Catholic Ireland have been somewhat more than an eighth. The whole number from the British islands has been little more than a quarter of the entire mass of arrivals into the American Republic from other countries during the last hundred years.

German and Norse Comers (as in Saxon England).—The bulk of that mass, nearly three-quarters of it, came from all the regions of Continental Europe and ultimately from the races least akin to the earlier America-making type. But for a long time this latter aspect did not appear. For after the new epoch of mass-immigration was opened by the Irish famine in 1846 the next great reinforcement was the German; distinctive but related; harmonizing quietly and well with the original north European elements. We have seen that the infiltration of this great race began in the 17th century. It went on through the 18th century. The German strain practically counts as one of the original elements in the United States. Already in 1790 it was 6 per cent of the whole. It was reinforced by a slowly enlarging flow until the 19th century was nearly half through. Then German migration to America became a sweeping tributary. First, the potato blight appeared in Germany as in Ireland and was accompanied by bad harvests generally. Next, after the revolutionary idealism of 1848, came crushing political disillusionment, and industrial depression. Between 1845 and 1875 over 2,000,000 born German-speakers went to the United States (including those from Austria). Over two and a half millions more followed during the next 20 years (1875–1895). In the middle of this period the flow was at its fullest. In the next period of nearly 20 years (1895–1914) Teutonic emigration diminished very rapidly. By comparison with its former volume, it became a trickle of no relative importance. Nevertheless, it added by degrees another half-million arrivals to their kindred, in the United States. The total German inflow into the English-speaking Republic from 1845 to the outbreak of the World War, was fully equal to the Irish though it reached its height later and fell off more abruptly. Scandinavian emigration meanwhile was a strong secondary movement always, and in the last two decades of the old pre-war order in Europe became stronger than the German. This was no new kind of thing in the world. Norse immigrants though they came into the old islands blade in hand had been merged with English-speakers of the pre-Conquest sort, a thousand years before.

Economic Interactions between America and Europe.—The economic and psychological interactions between Europe and the new continents would deserve a volume. We have seen how Raleigh's potatoes twice changed, and changed out of recognition each time, the social state of a whole nation, Ireland. When Eli Whitney invents the cotton-gin there is a potent stimulus to American supply of raw material; equally this develops Lancashire manufacture on the other side; textile progress in Britain further stimulates in the southern States, production and slave labour. But British invention itself acts with revolutionary effect in every field of industry and transport. James Watt and George Stephenson introduce into the world steam-power and the railway. These two things in the end do more than anything else to open up the United States interior, to knit the Republic together from ocean to ocean, to unlock its resources, to multiply its people and transform its aspect. Is wheat-growing extended by railway construction financed by British loans? Then, an inundation of American wheat-imports soon has a swamping effect on the old conditions of insular agriculture. The effect of this is to send British emigrants in far larger numbers overseas. When the United States is unusually prosperous European emigration generally is stimulated; but it is also increased when Europe suffers from economic depression. In that continent the effects of these economic interactions added to the political and religious factors went deeper and deeper. They first influenced western Europe; then Germany and the centre; and then reached the south and the east.

"The New Immigration" from South and East Europe.—From this furthest effect a complete transformation of the racial influx into the United States was to come. And its volume was swollen while its character was totally altered. This movement in its heavy proportions began towards the end of the 19th century and went on with cumulative effect until the World War. It pumped into the arteries of the American people a full infusion of blood from southern and eastern Europe. The eventual results upon the temperament and mentality of the whole nation cannot yet be measured; but what more immediately concerns the present subject is that this novel kind of absorption meant another stage in the creation of still more millions and millions of English-speakers out of the most dissimilar varieties of foreign elements.

For nearly 20 years after the close of the Civil War the percentage of south Latin and Slav blood in the total of annual immigration was relatively small though increasing. In the '90s it became strongly predominant; and in the 20th century became three-fourths of the whole. Take first the new Latin arrivals. In 1871–80 only 50,000 Italians entered the United States; in 1881–90 there were 300,000; in 1891–1900 over 650,000; in 1901–19 nearly 3,000,000. The aggregate of the arrivals from the Slav speaking countries, Russia, Poland, Lithuania, Czechoslovakia, Eastern Galicia, Yugoslavia, showed a parallel rise but was still greater. Add the other racial elements from south-eastern Europe —Greeks, Magyars, Rumanians and the rest. Altogether in one quarter of a century, the "new immigration" poured in more millions than British, Irish and Germans together had brought over in the previous generation. And the latest elements were for various reasons—during some considerable period at least, bound to increase faster on American soil than any of the rest.

VII. A GENERAL VIEW OF ENGLISH-SPEAKING LIFE

We must now indicate in broad figures the whole sweep of expansion which has created this English-speaking "world." But first it will be convenient here to show the growth of the British self-governing dominions overseas, adding the smaller elements in the West Indies and other scattered possessions. The estimate is complicated by the need to make allowance for the French in Canada, and the Dutch in South Africa—Australia and New Zealand being as much British, and as mainly English, by descent as were the people of the United States up to the middle of the 19th century.

White Population. Canada, Australasia, South Africa, etc.

1800	(less than) 500,000
1825	(nearly) 1,000,000
1850	2,500,000
1875	7,000,000
1900	11,000,000
1928	(nearly) 20,000,000

Of this latter number there are about three millions whose native or preferred speech is French or Dutch. Many of these also use English familiarly. It may be remarked in passing that there are

still 200,000 people even in the British islands who know no English but speak only Gaelic, Erse or Welsh.

The Rise to Nearly 200,000,000.—Now we can take together the mother-islands, the United States, the British self-governing Dominions, with small additions for other territories thinly settled and for all islands, outposts and administered regions. The Pisgah sight of the whole appears thus:—

1600–1928: General View of the Increase of English-speakers

1600	5,500,000
1700	8,000,000
1800	19,000,000
1825	32,000,000
1850	51,000,000
1875	82,000,000
1900	128,000,000
*1928 (about)	190,000,000

*United States 121,000,000; Great Britain and Ireland 49,000,000; rest of the British Empire nearly 20,000,000.

To appreciate this table we must recollect the comparison not only with French (necessarily drawn into reference in former passages) but with other races. Even a hundred years ago English, so far from being as now the foremost, in extent of use amongst the languages of white peoples was only fourth in that list. Russian-speakers probably came first (counting subdivisions but disregarding the subject races of the Tsardom) rising towards 40,000,000. French-speakers (including those in Belgium, Switzerland, Canada) were second with nearly 35,000,000. Germans were a close third with some 34,000,000 (adding those in Austria and Switzerland). While below the latter figure was the number in the world (excluding those speaking Gaelic or Welsh only in the British Isles) to whom English was a mother-tongue. Now, the latter is easily first with its 190,000,000 of native and newly incorporated speakers; Russian second with over 130,000,000; German third with nearly 80,000,000; Spanish fourth with some 60,000,000; and French fifth with about 50,000,000 counting its coloured speakers in the colonies of the Republic as well as its speakers by race in Belgium, Switzerland and Canada.

In addition, there are some millions of civilized persons in other nations to whom English is almost as familiar as their own tongue; and it is used by more millions amongst the native populations under the British flag. Thus it is safe to say that this leading world-language which grew so slowly that even up to the beginning of the last century it was fourth on a list of comparative numbers of persons speaking European languages, has multiplied itself tenfold since then and is now well-known to more than 200,000,000 persons altogether.

Wider Spheres of Influence.—And here open still wider considerations. The vogue of the language is exceeded by relative positions and responsibilities in other respects. Between them, the English-speaking communities in politics either control or predominantly influence nearly half the land-area of the whole earth and much more than a third of its entire population—variously estimated at between 1,800,000,000 and 2,000,000,000. Jointly they hold the absolute supremacy of all the oceans. They decided the issue of the World War. They created the League of Nations, though the United States afterwards withdrew and stands apart. But none the less the Washington Government by the Kellogg Pact has induced all civilization to denounce war—except in self-defence or against direct aggression on established spheres of influence—as an international crime worthy of outlawry.

Britain in Asia and Native Africa.—In India and beyond a handful of trained British administrators organize or supervise the government of 325,000,000 Asiatics; and in the Dark Continent, the government of over 60,000,000 Africans including direct or indirect responsibility for the whole length of the Nile from its equatorial lakes to Egypt; while the Palestine mandate in the same experienced hands makes the Zionist hope possible. As well the original islanders control in many seas a thousand other islands, amongst them Singapore and Hongkong which were nothing when occupied and are now amongst the densest seaports in the world. Where this administration has advanced amongst coloured races numbering a fifth of the human species, roads and railways, harbours and irrigation, posts and telegraphs, have followed as a matter of course; but also social security, legal justice, religious freedom, educational progress, newspapers, ideas of liberty, and, above all, medical services and sanitation. The new experiment in Indian self-government by representative institutions, is a thing of measureless interest. Whatever happens in the future, the story of organization in Asia and Africa by handfuls of English-speakers will remain one of the legends of history.

The Co-Nations.—Yet all this is but part of the tale. Nearly two-thirds of the territories included in what is called the British Empire are not an empire, but the very opposite. They are not under any central control whatever. The British self-governing dominions overseas are rather less restrained by the mother country than is South America by the Monroe Doctrine. Great Britain and Northern Ireland, the Irish Free State, Canada and Newfoundland, Australia and New Zealand, the South African Union, are an association of free and equal Commonwealths held together by tradition, by good-will and good-judgment but above all by the extent of their liberty.

The United States and its Orbit.—Next, turn to the American Union which includes nearly two-thirds of all the English-speakers. It is in many ways as different as possible from the other system just described. The Republic is as consolidated as the Empire is dispersed. The former occupies half a continent with two long fronts on two main oceans. It is in itself by far the mightiest single nation. It has applied machine-power and raised average human prosperity with unexampled success. Its available wealth is practically equal to that of all Europe put together—if Europe could be put together. America produces over 20 per cent of the world's wheat, over 40 per cent of its coal, over 50 per cent of its copper, nearly 60 per cent of its cotton, fully 60 per cent of its steel and over 70 per cent of its oil. Based on her massive gold-reserves she has become the chief creditor nation. Nowhere and at no time has civilization seen anything like this position relative to other countries. But just as in the case of the original island though in a different way, America's political orbit is far larger than her own extent. North and south in the double-continent of the New World, she predominates in fact—however considerate may be the formulations of the Monroe Doctrine—over an area larger than that of the entire British Empire. As already suggested in passing, her power of influence over the South American nations is greater than Britain's power of influence over the self-governing co-nations of the British Empire.

Republic and Empire.—Where so many things in all this study are either unlike other recorded movements of races and languages or utterly exceed them in measure, another extraordinary thing is the existence side by side of two systems, each so gigantic in different ways as the American hegemony and the British Empire under English-speaking leadership. The Republic with all its racial admixtures is by no means so miscellaneous as is the Empire with its extreme range of geographical distribution and its bewildering variety of human composition.

VIII. TOWARDS 300,000,000: THE FUTURE AND ITS PROBLEMS

Since this English-speaking situation in the world would be inconceivable if it did not actually exist, can we speculate usefully upon the prospects and problems of the future? In spite of the American Immigration Laws of 1921 reducing in a drastic way the influx from southern and eastern Europe, it is generally assumed that the population of the United States alone will be about 150,000,000 by 1950 and over 200,000,000 by the end of the century. The British islands seem likely before very long to become stationary at a limit of about 50,000,000. Though nothing like the rate of multiplication of English-speakers in the 19th century seems likely to occur in the future, it is reasonable to assume that their aggregate will reach over 300,000,000 by the end of the 20th century. It would seem that of white races only the Russian-speakers have some chance—by no means necessarily a sure chance—of ultimately attaining equal numbers.

Anglo-Americanism is not Anglo-Saxonism.—A main

question, therefore, for the world, and perhaps its principal question, is whether the English-speaking communities will prove capable of pursuing in the greatest matters concerning them and all mankind a common world-policy. Will settled friendship prevail or will friction increase? Concord or discord? Upon the answer everything may depend for the better or worse course of general civilization. In the last few years relations have not been satisfactory nor can it ever be easy to make them perfect. To distinguish between speech and race—Hindu orators for instance, like orators before them, have an unapproachable fluency in the English language for agitation against English rule—is as we saw at the outset, an elementary business of the modern historian. The common language of the English-speaking world expresses many profound diversities of race, temperament and thought; of historic imagination and present political sympathy. In face of these facts the old "Anglo-Saxon" theory has been for many years not only obsolete but prejudicial. A much broader basis of intelligence and appreciation is required. In America or Australia an ordinary citizen of Irish-Celtic descent may cease in reason to cherish the former bitterness of the old feud but cannot be expected to feel a positive pro-British instinct. It is natural for an American of German blood to think of Germany with sentiments of affection and romance. And so with other millions of Italian or Slav blood in the American Union. They have like those of British origin, but usually more so, their own cults of ancestor-worship, and the mother-island plays no part in their dream. Yet all these necessarily are English-speakers.

Sea-power and Sea-law.—These variations of feeling are apt to accentuate any political disagreement or misunderstanding that may arise from time to time between Britain and America. There has been no war between them for well over a century, and this again—considering how obstinate are apt to be the quarrels of kinsmen—is one of the more significant and encouraging facts of modern history. For, controversies have been recurrent, sharp and sometimes dangerous. Under past conditions of contact phases of friction were inevitable; but we are all prone to forget how much they have diminished in frequency and severity. The chief matter of practical difference has been that of naval power and maritime law—as we might well expect since the seas are the common pathway for the traffic and trade and personal voyages of all English-speakers; and this question, owing to the epochal events and changes of recent years, has become all-important for their present and future relations.

From its beginning the American Union has urged the largest rights of neutrals to trade freely upon the high seas in time of war. The island depended for its life upon the utmost use of sea-power as against land-power. This controversy led to the last armed quarrel in 1812. During the American Civil War the maritime controversy in another form became threatening again, but was settled for the time by a memorable arbitration heralding the best hopes of to-day. After the outbreak of the World War the British blockade, the only means of preventing the triumph of the Central Empires, made the maritime tension so acute that if German policy had been more judicious, the United States, possibly, might have declared against the Allies. Even when President Wilson was their Associate he demanded amongst his Fourteen Points, the Freedom of the Seas and made it plain that America otherwise must proceed to create a fleet strong enough to assert in all circumstances her own freedom. The British preferred the latter alternative formidable as it was, for the sound reason—peace being still insecure—that the former might have left them at a deadly disadvantage against military possibilities in Europe and Asia. Accordingly, the American fleet was developed with the purpose of making it second to none.

Naval Parity and its Implications.—The Washington Conference of 1921 thus became the most momentous deliberation that had ever affected simultaneously all the English-speaking peoples. Britain ceded her majestic tradition of separate sea-supremacy and accepted the principle of naval equality with America—the United States, in the new international spirit, renouncing the power they possessed of creating a naval dominance of their own. None the less, dispute gradually arose as to the technical arrangements required to realize in fact, without injustice to either side, the accepted theoretical parity. It became active in 1927 at the abortive Geneva Conference on the subject—acutely touching certain types of cruisers—and remained more or less unpleasant down to the end of 1928. Then American opinion having rejected larger propositions of naval increase favoured Mr. Coolidge's recommendation to build 15 large cruisers for parity. British opinion was equally resolved not to enter upon any competition in naval armaments with the United States.

In any case American parity will exist in strength and practice. This, as a result of the late War, is the largest world-change of its kind since Cromwell. It means two very different things. On the one hand, the British navy alone cannot determine future sea-law. Britain cannot have more right to interfere with American commerce than America with British commerce; and thus the way is open and wide towards such a revision of sea-law as shall remove the old cause of difficulty and the last remaining danger to the future of English-speaking relations. Happily this course seems pretty sure to be taken. For on the other hand, their joint sea-power while they remain in amity is far greater than ever and more deeply secured. The British islands can accept the "freedom of the seas" now that the rise of the American navy places a double-guarantee behind it. Far more than ever, for the old land with its industrial democracy under universal suffrage, "peace is the greatest of British interests"; and apart from that, nowhere is the idealism of peace more earnest and profound. But if the hope of world-peace were frustrated, then under the new sea-law which naval parity implies and demands, America even as a neutral would be the sure source of the sea-supplies that are Britain's life.

IX. THE KEY OF THE WORLD

Upon the degree to which the two peoples may be at one or at odds the future of mankind evidently will depend more than upon any other political influence for generations to come. Since the days of the old exclusive "Anglo-Saxon" fallacy, suggesting a unity of race such as long since ceased to exist, exaggeration in the usual way has swung over to the other extreme. Of late years, it has become a fashion to emphasize and overcolour the modern contrasts between the mother-island and the United States.

The Theory of "Foreigners": its Exaggerations.—It is frequently said indeed that the American and British nations have become permanently "foreign" to each other. This vivacious paradox will not last. Not only is it as we have seen a sweeping falsification of history; but it is a distortion of relative values; and makes a part of the facts greater than the whole. You might as justly say that the German Reich and German Austria are foreign to each other. The essential characteristic of "foreignness" as between two peoples is that they are in the mass mutually unintelligible. In the far end, a common language, whatever the original racial varieties of those who speak it, makes for common sympathies. This very process made Great Britain itself. Those, for example, of German or Italian descent amongst the citizens of the United States have every claim to be proud of their derivation and to feel with their races on the other side. But those mainly of British descent, the largest and strongest element in North America, are assuredly not less qualified to be proud of their names and origin; and to say with Wordsworth:—

> ". . . we are sprung
> Of earth's best blood, have titles manifold."

Theirs is the main blood of the makers of America. From them came the foundations, the framework, the Constitution and the laws, no less than the very language, without which, and its absorbing influences, the unity of the American nation itself, despite all its modern mingling of nations, could by no possibility have been preserved.

The Real Community.—In America as in Britain, English will continue to be the language of life, of publication, of education. Numberless little usages of words and phrases, peculiar to one side or the other cannot alter this movement. An English artisan picks it all up very rapidly after landing in the United States. To-day as formerly, American literature at its best often prefers to show an English style of fastidious purity, yet vital,

untouched by imitative pedantry. The English-speakers of any of the sea-spread communities can enter anywhere into full private intercourse at once. They can read at once each others' books and newspapers. Between the masses of any truly "foreign" nations none of this is possible. There is far more community than "foreignness" in the English-speaking world. Modern invention as it increases all the facilities for intercourse and knits new practical ties of all kinds tends to increase that community. Despite the breadth of the ocean there are countless private friendships between American and British individuals. Between many of them indeed, it is "the genius of friendship."

This Hope, or None.—For over a hundred years all pessimistic or interested expectations of a breach between the two peoples have been frustrated. They have eliminated many worse causes of friction than any recently arisen. They have settled amicably maritime broils, fishery disputes, boundary disputes. The poison has been extracted from the old sting of the Irish question. Now, their further and lasting agreement is indispensable to the other great hopes of mankind. If Britain and America with the same great mother-tongue in common, with so many similarities in democratic institutions and social ideas, with all their practical ties and human intimacies—if these two proved unable to set an unbreakable example of good understanding, there could be no rational hope that other nations truly and completely "foreign" to each other would appease their feuds and learn instead to live in creative harmony. With their numbers, their prospects of further growth, their command in effect of nearly half the earth's surface and more than half its resources at present available, with their power over all the seas—the English-speaking peoples, and these alone, have in their hands for good or evil the key of the world's destinies. By discord pushed to the worst they could bring about universal chaos followed by a new Dark Age such as some thinkers in continental Europe imagine. By concord they can ensure by degrees disarmament, mediated settlements, and peace for long generations, perhaps for ever. Their past has been very great, but if—as the signs on the whole strongly promise—they are true to the duties of their opportunities the greatest epochs of their history are yet to come. (J. L. G.)

ENGRAVING. In its widest signification, engraving is the art of cutting lines or furrows on plates, blocks or other shapes of metal, wood or other material. In this sense the craft has been used for decorative purposes from remote antiquity. In the narrower connotation with which this article is concerned, *i.e.*, engraving for the sake of printing impressions on paper or allied fabrics, the art cannot be traced back before the Christian era. By a transference of terminology, illogical but stereotyped by usage, these impressions or prints are also called engravings. In the still more limited signification of line-engraving, the art does not go back before the first half of the 15th century.

The term is used, however, in a looser sense to include all the methods of engraving, cutting or treating plates, or blocks of metal, wood or stone, for printing impressions. These methods can be classed most conveniently as: (1) *Relief prints;* (2) *Intaglio prints;* (3) *Surface prints,* according as to whether the black line of the design (*i.e.*, the part inked for printing) on the original block, plate or stone is (1) in relief, (2) in intaglio (*i.e.*, cut into the surface), (3) on the surface (*i.e.*, on a level with the rest of the surface).

These divisions correspond roughly to (1) *Woodcut and wood-engraving;* (2) *Engraving and etching on metal;* (3) *Lithography;* each class requiring a different kind of printing.

Woodcut, the earliest of the methods used for making prints, as far as records are known, whether in the East or in Europe; the furrows on the block are cut by a knife, and it is only in its later development that the graver replaces the knife, being used on sections of box-wood instead of a softer wood in the plank.

In the East the earliest certain date of a picture printed on paper from a wood-block occurs in a Chinese work, the *Diamond Sutra* Roll of A.D. 868 (Stein collection, British Museum), but this shows an art already in considerable development. In Europe the printing of wood-blocks on textiles was a frequent practice in the middle ages, but impressions on paper hardly date before about 1400.

The earliest *line-engravings* were probably printed a few decades later; the first dated example belongs to 1446. Line-engraving was certainly developed by the goldsmiths, having a particularly close relationship to niello work, though Vasari errs in referring the actual discovery to the Florentine niello-engraver, Finiguerra.

Etching, in which the furrow is not cut, but bitten (etched, eaten) by acid, was not practised until about 1500, the earliest dated etching belonging to 1513.

Dry-point, in which the plate is scratched with a steel point like a pencil; used occasionally from the end of the 15th century, but not to any large extent until Rembrandt's time; it has constantly been used since by etchers, either purely or in combination with etching.

Mezzotint, the earliest of the processes to aim at purely tonal effects, was discovered by Ludwig von Siegen about 1642, and practised with the greatest brilliance in the later 18th century for the reproduction of Reynolds and contemporary portrait painters.

Aquatint, another tone process, wherein the grain is achieved by etching through a porous ground, is generally supposed to have been introduced by J. B. Le Prince about 1768, though occasional examples of a similar grain may be quoted at an even earlier period than that.

Stipple, another method introduced about the middle of the 18th century, is obtained by a system of dots, first etched and then finished with the point of a curved stipple graver. A system of dots, obtained by various means such as roulettes, is also the basis of *crayon-engraving,* which imitates the character of a crayon drawing. It was the immediate forerunner and constant companion of stipple.

Many of the intaglio methods already described are occasionally found in combination on the same plate: such as line-engraving on the basis of an etched foundation (particularly in the 18th and 19th centuries); etching touched with dry-point; aquatint combined with various forms of crayon-engraving, especially by the colour engravers of the 18th century. Line-engraving, etching and other intaglio methods are sometimes found combined with woodcut or wood-engraving, notably in certain 17th and 18th century chiaroscuro engravings, and in Baxter's colour-prints in the 19th century.

Lithography was introduced by Aloys Senefelder about 1798. It may be regarded as the most direct method of imitating the character of original chalk drawing, but it possesses qualities of its own which justify its position apart from the multiplication of designs.

The following notes deal with general matters relating to engraving and prints:—

Original Engraving (etching, etc.) does not imply the original plate (block, etc.), but any print of which the engraver is his own designer.

Impression is the term applied to any print from block, plate or stone.

State signifies a stage of development in an engraving. An artist often takes impressions (or proofs) of his work at various *states* of an engraving.

Counterproof is a proof taken, not from the original plate, but from a wet impression, with the purpose of obtaining a picture in the same direction as the original plate, generally to aid the engraver in making corrections or additions to his copper.

In view of the common misconception that engraving invariably implies reproduction (for the multiplication of an original design

by engraving must be clearly distinguished from an engraving which reproduces the work of another artist), it is necessary to emphasize the importance of engraving in its various manifestations as a medium of original expression, constantly appreciated and used for the sake of its own inherent and varied qualities by many of the greatest artists from the 15th century onwards.

Bibliography.—*Guide to the Processes and Schools of Engraving*, issued by the British Museum. (A. M. H.)

ENGROSSING, a term used in two legal senses: (1) the writing or copying of a legal or other document in a fair large hand (*en gros*), and (2) the buying up of goods wholesale in order to establish a monopoly and sell at a higher price. Engrossing and the kindred practices of forestalling and regrating were early regarded as serious offences in restraint of trade, and were punishable both at common law and by statute. They were of more particular importance in relation to the distribution of corn supplies. The statute of 1552 defines engrossing as "buying corn growing, or any other corn, grain, butter, cheese, fish or other dead victual, with *intent to sell the same again.*" The law forbade all dealing in corn as an article of ordinary merchandise, apart from questions of foreign import or export. The theory was that when corn was plentiful in any district it should be consumed at what it would bring, without much respect to whether the next harvest might be equally abundant, or to the immediate wants of an adjoining province of the same country. The first statute on the subject appears to have been passed in the reign of Henry III., though the general policy had prevailed before that time both in popular prejudice and in the feudal custom. The statute of Edward VI. (1552) was the most important. Any one who bought corn to sell it again was made liable to two months' imprisonment with forfeit of the corn. A second offence was punished by six months' imprisonment and forfeit of double the value of the corn, and a third by the pillory and utter ruin. Severe as this statute was, liberty was given by it to transport corn from one part of the country to another under licence of men of approved probity, which implied that there was to be some buying of corn to sell it again and elsewhere. Practically "engrossing" came to be considered buying wholesale to sell again wholesale.

"Forestalling" was different. Statutes were directed against dealers who bought or contracted for corn and other provisions, and spread false rumours in derogation of the public and open markets appointed by law. The statute of Edward VI. was modified by many subsequent enactments, particularly by the statute of 1663, which declared that there could be no "engrossing" of corn when the price did not exceed 48*s.* per quarter, and which Adam Smith recognized, though it adhered to the variable and unsatisfactory element of price, as having contributed more to the progress of agriculture than any previous law in the statute book.

In 1773 these injurious statutes were abolished, but the penal character of "engrossing" and "forestalling" had a root in the common law of England, as well as in the popular prejudice, which kept the evil alive to a later period. In 1844, all the statutes, English, Irish and Scottish, defining the offences, were repealed and with them the supposed common law foundation. In the United States there have been strong endeavours by the Government to suppress trusts and combinations for engrossing. (*See* also Trusts; Monopoly.)

ENHARMONIC, a musical term having more than one meaning. In its earliest use it was applied to one of the three genera in ancient Greek music, viz., the diatonic, the chromatic and the enharmonic, the last-named containing intervals smaller than a semitone, termed dieses. In modern usage it is employed in such terms as "enharmonic modulation," "enharmonic notation," and the like, when, in consequence of the adoption of equal temperament, what are actually two different notes, *e.g.*, C sharp and D flat, are treated as one and the same. Thus in the following example, illustrating how a chord can be enharmonically altered, the notes as actually sounded on the pianoforte are the same in each instance, but in consequence of the altered notation each chord is, harmonically considered, entirely different and belongs to a different key:

To which it should be added that an enharmonic change of notation may also be adopted for simple convenience of performance (*i.e.*, to avoid a multiplicity of sharps or flats) and without any modulatory purpose. (*See* Harmony; Modulation.)

ENID, a city of Oklahoma, U.S.A., 65m. N.W. of Oklahoma city; the county seat of Garfield county. It is on Federal highways 64, 164 and 81; has an air port; and is served by the Frisco, the Rock Island and the Santa Fe railways. The population was 16,576 in 1920 (94% native white), and was estimated locally at over 31,000 in 1928. It is the leading grain market of the State, and the general trade centre for a rich agricultural district, producing chiefly grain, live stock, alfalfa, milk, poultry and broom corn, and for the oil and gas fields in the eastern and southern part of the county. It has railroad shops, terminal elevators (capacity 3,000,000bu.), oil refineries, flour mills and meat-packing plants, a milk condensery and factories making agricultural implements, tractors, threshers and wire. The output of the factories within the city in 1927 was valued at $10,000,000 and included 6,000,000 lb. of butter. Enid was founded and incorporated in 1893.

ENIGMA, a riddle or puzzle, especially a form of verse or prose composition in which the answer is concealed by means of metaphors. Such were the riddle of the Sphinx and the riddling answers of the ancient oracles. The composition of enigmas was a favourite amusement in Greece and prizes were often given at banquets for the best solution of them (Athen. x. 457). In France during the 17th century enigma-making became fashionable. Boileau and J. J. Rousseau did not consider it beneath their literary dignity. The word is applied figuratively to anything inexplicable or difficult of understanding.

ENIMAGAN, an independent linguistic stock of South American Indians, so called from the Enimagas (Enimas) who were one of its best known tribes. The area occupied by these tribes in south-eastern Bolivia in the northern Chaco extends from the Paraguay river between 22° and 20° S. lat. northwestward to about 62° W. long. The more important tribes of the stock to-day are the Lenguas (*q.v.*) and the Guanas, the latter to be distinguished from the tribe of the same name in the Brazilian province of Matto Grosso, who are of Arawakan (*q.v.*) stock. The Enimagan tribes were originally a semi-nomadic, hunting and fishing folk, living in communal reed thatched huts often as much as a hundred and twenty feet long. Woollen or cotton mantles formed their ordinary dress, together with short kilts of the same material. The bow was their main weapon. They were good canoemen, and made a serviceable but rather crude pottery. The tribal chiefs were usually hereditary, but had little power. The dead were buried in shallow graves.

See G. Boggiani, *Compendio de etnografia paraguaya moderna* (Revista Inst. Paraguay, vol. iii., pp. 141–189); L. Kersten, "Die Indianerstämme des Gran Chaco, etc." (*Internat. Archiv für Ethnographie*, vol. xvii., pp. 1–75).

ENKHUIZEN, seaport in the province of North Holland on the Zuider Zee, and a railway terminus, 11½ m. N.E. by E. of Hoorn, with which it is also connected by tramway. Pop. (1927) 8,852. Enkhuizen has examples of domestic architecture from the 16th and 17th centuries, when it was an important and flourishing city. Some ruined gateways such as the Dromedary (1540) which overlooks the harbour are still standing. The Zuiderkerk, or South church, has a conspicuous tower (1450–1525). The Westerkerk, or West church, possesses a beautifully carved Renais-

sance screen and pulpit of the 16th century, and a quaint wooden bell-house (1519). The town hall (1688) contains some finely decorated rooms, a collection of local antiquities and the archives. Other buildings are the orphanage (1616), the weigh-house (1559), the upper story of which was once used by the Surgeons' Gild; the former mint (1611); and the ancient assembly-house of the dike-reeves of Holland and West Friesland. Enkhuizen possesses a considerable fishing fleet and has some shipbuilding.

ENKIDU, the name of the friend of Gilgamesh, the hero in the Babylonian epic (*see* GILGAMESH, EPIC OF). Enkidu is represented in the epic as the type of the primeval man. He is a wild man who lives with the animals of the field until lured away from his surroundings by the charms of a woman. Created to become a rival to Gilgamesh, he strikes up a friendship with the hero, and together they proceed to a cedar forest guarded by Khumbaba, whom they kill. The goddess Irnina (a form of Ishtar, *q.v.*) in revenge kills Enkidu, and the balance of the epic is taken up with Gilgamesh's lament for his friend, his wanderings in quest of a remote ancestor, Ut-Napishtim, from whom he hopes to learn how he may escape the fate of Enkidu, and his finally learning from his friend of the sad fate in store for all mortals except the favourites of the god, like Ut-Napishtim, to whom immortal life is vouchsafed as a special boon.

This ancient legend of the satyr Enkidu is believed by some to be the source of the legend of the beguiling of Adam by Eve in the Hebrew of Genesis iii.

ENLIGHTENMENT, a term used as the equivalent of the German *Aufklärung* to designate a period of great intellectual activity in the cause of general education and culture, including the preparatory self-emancipation from mere prejudice, convention and tradition. The name is applied primarily to the movement in 18th century Germany which was inspired by the so-called popular philosophy of Lessing, Mendelssohn, Reimarns and others. It is sometimes extended so as to include the England of Locke and Newton and the France of Condillac, Diderot and Voltaire. Occasionally the term is also applied to the Greece of the Sophists (*q.v.*) and the study of the Renaissance.

See the Histories of Philosophy by W. Windelband, by J. E. Erdmann and by F. Überweg.

ENNA: *see* CASTROGIOVANNI.

ENNEASTYLE, in architecture, the term applied to a building or portico with nine columns on the front.

ENNEMOSER, JOSEPH (1787–1854), Austrian medico-philosophic writer, was born on Nov. 15, 1787, at Hintersee in Tirol. After fighting against the French in 1809 and again in 1813–14, he took his M.D. at Berlin in 1816, and three years later was appointed professor of medicine at the new University of Bonn. He practised at Innsbruck from 1837–1841, when he moved to Munich, where he became widely known by his use of hypnotism. He died on Sept. 19, 1854, at Egern.

Besides his chief work, *Der Magnetismus in seiner geschichtlichen Entwickelung* (1819; 2nd ed., 1844, partial Eng. trans. 1854), Ennemoser's writings include: *Historisch-psychologische Untersuchungen über den Ursprung und das Wesen der menschlichen Seele* (1824; 2nd ed., 1851); *Der Magnetismus im Verhältnis zur Natur und Religion* (1842; 2nd ed., 1853), and *Anleitung zur mesmerischen Praxis* (1852).

ENNIS, county town of Co. Clare, Ireland, on the river Fergus, 25 m. N.W. from Limerick by rail. Pop. of urban district (1926), 5,517. Incorporated in 1612, it returned two members to the Irish parliament until the Union. The Roman Catholic church is the pro-cathedral of the diocese of Killaloe; the parish church was formed out of the ruins of the Franciscan abbey founded in 1240. The ruins of Clare abbey, founded in 1194, and of Killone abbey are near the town. Five miles N.W. is Dysert O'Dea, with a cross, a round tower and a castle. Ennis (Gaelic *Innis,* an island) has breweries, distilleries and flour mills. Limestone is quarried in the neighbourhood.

ENNIS, a city of Ellis county, Texas, U.S.A., 33m. S.S.E. of Dallas, on Federal highway 75, and served by the Southern Pacific and the Texas Midland railways. The population was 7,224 in 1920 (27% negroes), and was estimated locally at nearly 11,000 in 1928. Ellis county is one of the principal cotton growing counties in the country (130,690 bales in 1926), and the city's chief industries are cotton gins and compresses and cotton-seed oil mills. It has railroad shops also. Ennis was settled in 1871 and incorporated as a city in 1872.

ENNISCORTHY, a market town of Co. Wexford, Ireland, on the river Slaney. Pop. of urban district (1926), 5,545. The castle was founded in 1176. Ferns, nearby, was the seat of a former bishopric, and the cathedral, ruins of an Augustinian monastery founded about 1160, and of a Norman castle, may still be seen. Enniscorthy was incorporated by James I. It was taken by Cromwell in 1649 and burnt in 1798. There are breweries, flour mills, tanneries and wool factories. Trade in agricultural produce is facilitated by water communication with Wexford. There are fowl-markets and horse-fairs.

ENNISKILLEN, WILLIAM WILLOUGHBY COLE, 3RD EARL OF (1807–1886), British palaeontologist, was born on Jan. 25, 1807, and educated at Harrow and Christ Church, Oxford. Lord Cole, as he then was, amassed with his friend Sir Philip de M. G. Egerton a fine collection of fossil fishes now in the British Museum. He died on Nov. 21, 1886, being succeeded by his son (b. 1845) as 4th earl.

The first of the Coles (an old Devonshire and Cornwall family) to settle in Ireland was Sir William Cole (d. 1653), who was "undertaker" of the northern plantation and received a grant of a large property in Fermanagh in 1611, and became provost and later governor of Enniskillen. In 1760 his descendant John Cole (d. 1767) was created Baron Mountflorence, and the latter's son, William Willoughby Cole (1736–1803), was in 1776 created Viscount Enniskillen and in 1789 earl. The 1st earl's second son, Sir Galbraith Lowry Cole (1772–1842), was a prominent general in the Peninsular War, and colonel of the 27th Inniskillings, the Irish regiment with whose name the family was associated.

ENNISKILLEN (INNISKILLING), market town and county-town of Co. Fermanagh, Ireland, situated on an island between upper and lower Loughs Erne, 116 m. N.W. of Dublin by rail. Pop. of urban district (1921) 4,847. It was incorporated by James I. In 1689 it defeated a force sent by James II. Two miles away is Devenish island, with the abbey of St. Mary, founded by St. Molaise (Laserian) in the 6th century, and with a round tower 85 ft. high and a cross. Enniskillen has tanneries and a small manufactory of cutlery. Trade is in agricultural produce. There are extensive water communications by river and by the loughs Erne, and also by the Ulster canal to Belfast. The loughs contain trout, large pike and other coarse fish.

ENNIUS, QUINTUS (239–170 B.C.), ancient Latin poet, was born at Rudiae in Calabria. Familiar with Greek as the language in common use among the cultivated classes of his district, and with Oscan, the prevailing dialect of lower Italy, he further acquired a knowledge of Latin; to use his own expression (Gellius xvii., 17), he had three "hearts" (*corda*), the Latin word being used to signify the seat of intelligence. We first hear of him in 204 in the Second Punic war. He served as a centurion in Sardinia and he attracted the attention of Cato the elder, who took him to Rome in the same year. Here he taught Greek and adapted Greek plays for a livelihood; his writings gained him the friendship of the greatest men in Rome, including the elder Scipio and Fulvius Nobilior, whom he accompanied on his Aetolian campaign (189). Through the influence of Nobilior's son, Ennius subsequently obtained Roman citizenship (Cicero, *Brutus*, 20, 79). He lived at Rome till his death. The epitaph which he composed for himself expresses his pride in his achievement "Let no one weep for me, or celebrate my funeral with mourning; for I still live, as I pass to and fro through the mouths of men." The fragments of his work and the testimony of his countrymen show us a man of a cheerful nature (Hor. *Epp.* ii. 1. 50; Cic. *De sen.* 5); of great industry and versatility; combining imagination and a vein of religious mysticism with a sceptical indifference to popular beliefs and a scorn of religious imposture; and tempering the gravity of a Roman with a genial capacity for enjoyment (Hor. *Epp.* 1, 19, 7).

Till the appearance of Ennius, Roman literature had been most successful in comedy. Naevius and Plautus were men of popular fibre. Ennius, on the other hand, was in sympathy with the

dominant aristocratic element in Roman life. Under his influence literature began to appeal to a limited and cultivated class, but at the same time to express more truly what was greatest and most enduring in the national traditions. He was a man of many-sided activities. He dealt with questions of Latin orthography, and is said to have been the first to introduce shorthand writing in Latin. He attempted comedy, but with so little success that in the canon of Volcacius Sedigitus he is placed tenth, and last in the list of comic poets. He may be regarded also as the inventor of Roman satire, in its original sense of a "miscellany," although it was Lucilius who gave it the character of a criticism of men and manners. The *saturae* of Ennius were collections of writings on various subjects, written in various metres and contained in four (or six) books, and included metrical versions of the physical speculations of Epicharmus, and of Euhemerus. Original compositions were also contained in these *saturae*, and among them the panegyric on Scipio, unless this was a drama. The satire of Ennius seems to have resembled the more artistic satire of Horace in its record of personal experiences, in the occasional introduction of dialogue, in the use made of fables with a moral application, and in the didactic office which it assumed.

But the chief distinction of Ennius was gained in tragic and narrative poetry. The titles of about 25 of his tragedies are known to us, besides fragments, the longest consisting of about 15 lines. These tragedies were mostly adaptations and translations from Euripides. One or two were original dramas dealing with Roman subjects (*praetextae*); thus, the *Ambracia* treated of the capture of that city by his patron Nobilior, the *Sabinae* of the rape of the Sabine women. The language is generally nervous and vigorous, but flows less smoothly than that of the dialogue of Latin comedy. It shows the same tendency to aim at effect by alliterations, assonances and plays on words. The rudeness of early art is most apparent in the inequality of the metres in which both the dialogue and the "recitative" are composed.

But his greatest work, which was admired by Cicero and Lucretius and imitated by Virgil, was the *Annales*, a narrative poem in 18 books, containing the record of the national story from mythical times to his own. Although the conception of the work implies a confusion of the provinces of poetry and history, yet it was the instinct of genius to discern in the idea of the national destiny the only possible motive of a Roman epic. The poem (to judge from the fragments, amounting to about 600 lines), although rough, unequal and often prosaic, seems to have breathed the true Roman spirit, and to have contained flashes of poetic imagination—that *ingenium* which later critics regarded as the distinguishing characteristic of Ennius. Ennius prided himself especially on being the first to form the strong speech of Latium into the mould of the Homeric hexameter in place of the old Saturnian metre. And although it took several generations of poets to beat their music out to the perfection of the Virgilian cadences, yet in the rude adaptation of Ennius was first discovered the secret of what ultimately became one of the grandest organs of literary expression. The inspiring idea of the poem was perfected by Virgil in his Aeneid, which is linked to the ancient tradition by the deliberate and skilful use of phrases of Ennius. The occasional references to Roman history in Lucretius are evidently reminiscences of the *Annales*. He as well as Cicero speaks of him with pride and affection as "Ennius noster." Of the great Roman writers Horace had least sympathy with him; yet he testifies to the high esteem in which he was held during the Augustan age. Ovid expresses the grounds of that esteem when he characterizes him as

"ingenio maximus, arte rudis."

A sentence of Quintilian expresses the feeling of reverence for his genius, mixed with distaste for his rude workmanship, with which the Romans of the early empire regarded him: "Let us revere Ennius as we revere the sacred groves, hallowed by antiquity, whose massive and venerable oak trees are not so remarkable for beauty as for the religious awe which they inspire." (*Inst. or.* x. 1. 88).

Editions of the fragments by L. Valmaggi (Turin, 1900, with notes), J. Vahlen (Leipzig, 1903); G. Pascoli in *Epos* (Livorno, 1911); L. Müller in Postgate's *Corp. Poet. Lat.*; E. M. Steuart (1925) with notes; monographs by L. Müller (1884 and 1893), C. Pascal, *Studi sugli scrittori Latini* (1900); *see* also Mommsen, *History of Rome*, bk. iii. ch. 14. On Virgil's indebtedness to Ennius *see* V. Crivellari, *Quae praecipue hausit Vergilius ex Naevio et Ennio* (1889); E. Norden, *Ennius und Vergilius* (1915); de Gubernatis, *Ennio* (Turin, 1915).

ENNODIUS, MAGNUS FELIX (A.D. 474–521), bishop of Pavia, Latin rhetorician and poet. He was born at Arelate (Arles) and brought up at Ticinum (Pavia) or possibly Mediolanum (Milan). When the lady to whom he was betrothed went into a convent Ennodius entered the Church, and was ordained deacon (about 493). From Pavia he went to Milan, where he remained until made bishop of Pavia about 515. As bishop of Pavia he played a considerable part in ecclesiastical affairs. On two occasions (in 515 and 517) he was sent to Constantinople by Theodoric on an embassy to the emperor Anastasius, to endeavour to bring about a reconciliation between the Eastern and Western churches. He died on July 17, 521; his epitaph still exists in the basilica of St. Michael at Pavia (*Corpus Inscriptionum Latinarum*, v., pt. ii., No. 6464).

Ennodius is one of the best representatives of the twofold (pagan and Christian) tendency of 5th century literature, and of the Gallo-Roman clergy who upheld the cause of civilization and classical literature against the inroads of barbarism. But his anxiety not to fall behind his classical models—the chief of whom was Virgil—his striving after elegance and grammatical correctness, and a desire to avoid the commonplace have produced an affected style, which, aggravated by rhetorical exaggerations and popular barbarisms, makes his works difficult to understand.

His works include:—(1) Letters on a variety of subjects, addressed to high church and state officials, which are valuable for the religious and political history of the period. (2) Miscellanies, of which the most important are: *The Panegyric of Theodoric*, written to thank the Arian prince for his tolerance of Catholicism and support of Pope Symmachus (probably delivered before the king on the occasion of his entry into Ravenna or Milan); *The Life of St. Epiphanius*, bishop of Pavia, the best written and perhaps the most important of all his writings, an interesting picture of the political activity of the church; *Eucharisticon de Vita Sua*, a sort of "confessions," after the manner of St. Augustine; the description of the enfranchisement of a slave with religious formalities in the presence of a bishop; *Paraenesis didascalica*, an educational guide, insisting on the claims of grammar as a preparation for the study of rhetoric. (3) Discourses (*Dictiones*). That on the anniversary of Laurentius, bishop of Milan, is the chief authority for the life of that prelate; the scholastic discourses, rhetorical exercises for the schools, contain eulogies of classical learning, distinguished professors and pupils; the controversial deal with imaginary charges, the subjects being chiefly borrowed from the elder Seneca; the ethical harangues are put into the mouth of mythological personages. (4) Poems, including two *Itineraria*, descriptions of a journey from Milan to Brigantium (Briançon) and of a trip on the Po; an apology for the study of profane literature; an epithalamium, in which Love is introduced as execrating Christianity; a dozen hymns, after the manner of St. Ambrose, probably intended for church use; epigrams on various subjects.

There are two excellent editions of Ennodius by G. Hartel (vol. vi. of *Corpus scriptorum ecclesiasticorum Latinorum*, Vienna, 1882) and F. Vogel (vol. vii. of *Monumenta Germaniae historica*, 1885, with exhaustive prolegomena). Edition with French translation, by S. Léglise (1906 foll.). On Ennodius generally consult M. Fertig, *Ennodius und seine Zeit* (1855–60); A. Dubois, *La Latinité d'Ennodius* (1903); F. Magani, *Ennodio* (Pavia, 1886); A. Ebert, *Allgemeine Geschichte der Litt. des Mittelalters im Abendlande*, i. (1889); M. Manitius, *Geschichte der christlich-lateinischen Poesie* (1891); Teuffel, *Hist. of Roman Literature*, § 479 (Eng. tr., 1892).

ENNS, a small town of about 4,200 inhabitants in Upper Austria, on the left bank of the Enns near its confluence with the Danube. This site lay on one of the old salt routes across the Danube to Bohemia so that this is one of the oldest towns in Austria; nearby is the site of the Roman *Laureacum*. The present town grew around a castle built in 900 by the Bavarians as an outpost against Magyar attacks but the settlement soon gained prosperity as a market and obtained a charter as a free town in

1212. Passing to the Hapsburgs in 1275 it obtained the protection necessary to its development and now maintains its early functions as a regional centre. Three miles distant lies the magnificent Augustinian monastery of St. Florian, a foundation due to the Benedictines, who occupied it from the 7th to the 11th century; the library is famous for its collection of old manuscripts.

ENOCH was (Gen. iv. 17, 18) the eldest son of Cain, who named a city after him. But in the genealogy of the Priestly document he appears as the *seventh* in descent from Adam in the line of Seth. The brief notice in Gen. v. 21–24 is certainly a fragment from an Enoch myth. The fact that his years are given as 365 suggests that he was a solar hero. A connection between Enoch and the Euedorachos who is seventh in the list of antediluvian kings given by Berossus, and may be the Enmeduranki or Enmeduranna of other similar Babylonian lists, is possible, but precarious. (*See* Enoch, Book of, and Enoch, Book of the Secrets of.) Enoch appears in the Old Testament also as the name of clans belonging respectively to Midian and Reuben.

ENOCH, BOOK OF. The *Book of Enoch,* or, as it is sometimes called, the *Ethiopic Book of Enoch,* in contradistinction to the *Slavonic Book of Enoch* (*see* later), is perhaps the most important of all the apocryphal or pseudapocryphal biblical writings for the history of religious thought. It is not the work of a single author, but rather a conglomerate of literary fragments which once circulated under the names of Enoch, Noah and possibly Methuselah. In the *Book of the Secrets of Enoch* we have additional portions of this literature.

The *Book of Enoch* was written in the second and first centuries B.C. It was well known to many of the writers of the New Testament, and in many instances influenced their thought and diction. Thus it is quoted by name as a genuine production of Enoch in the Epistle of Jude, 14 *sq.*, and it lies at the base of Matt. xix. 28 and John v. 22, 27, and many other passages. It had also a vast indirect influence on the Palestinian literature of the 1st century of our era. Like the Pentateuch, the Psalms, the Megilloth, and the Pirke Aboth, this work was divided into five parts. With the earlier Fathers and Apologists it had all the weight of a canonical book, but toward the close of the 3rd and the beginning of the 4th century it began to be discredited, and finally fell under the ban of the church. Almost the latest reference to it in the early church is made by George Syncellus in his Chronography about A.D. 800. The book was then lost sight of till 1773, when Bruce discovered the Ethiopic version in Abyssinia.

That the *Book of Enoch* was written in Semitic is now accepted on all hands, but scholars are divided as to whether the Semitic language in question was Hebrew or Aramaic.

The author of the earliest portions was a Jew who lived in northern Palestine, in the land of Dan, near the headwaters of the Jordan. This fact "helps to explain the influence the book had upon the religion that was cradled in Galilee" (Burkitt). Of the authors of the other three books incorporated in the work we know nothing but what can be gleaned from their writings as to their religious standpoint. Charles holds that all the books were written by *Chasidim* (the "saints" of the Psalms), or by their successors the Pharisees; but Leszynsky has shown conclusively that a great portion of the earlier parts of Enoch emanated from Sadducaean circles. These two diametrically opposed standpoints are perhaps not really so antagonistic as appears at first sight, for the *Chasidim,* who existed long before the Pharisees and Sadducees emerged as opposed parties, included men of different views which in later times crystallized into what we understand by Pharisaic and Sadducaean; the *Chasidim* were, moreover, the spiritual forbears of the Apocalyptists. When, therefore, it is maintained that all the books incorporated in Enoch were written by *Chasidim,* it does not follow that the "Pharisaic" standpoint was the only one represented. Even in the later parts of the work, written when Pharisees and Sadducees were definitely opposed parties, it is evident that not all can be said to represent the Pharisaic standpoint; this is seen especially in some of the teaching concerning the Messiah, in the generally speaking universalistic spirit—which is quite un-Pharisaic, and in the attitude towards the Law which, while loyal, is not that of the Pharisees. Some parts are purely Pharisaic, and it seems certain that the whole work in its present form has been worked over by a Pharisee or Pharisees; but that all the post-Maccabaean portions in their original form emanated from Pharisaic circles seems hardly possible. It is far more likely that, with the exception of certain passages, the various component parts of the work were written by Apocalyptists who, while neither Pharisees nor Sadducees, were sufficiently wide in their outlook to hold views characteristic of each.

As regards the analysis of the book five main divisions can be recognized:

(1) *Chap. lxxii.–lxxxii.* constitutes a work in itself, the writer of which had very different objects before him than those of the writers of the rest of the book. His sole aim is to give the law of the heavenly bodies. The date of this section can be partially established, for it was known to the author of Jubilees, and was therefore written before the last third of the 2nd century B.C.

(2) *Chaps. lxxxiii.–xc.*—This section was written before 161 B.C., for "the great horn," who is Judas the Maccabee, was still warring when the author was writing. These chapters recount three visions: the first two deal with the first-world judgment; the third with the entire history of the world till the final judgment. An eternal Messianic kingdom at the close of the judgment is to be established under the Messiah, with its centre in the New Jerusalem set up by God Himself.

(3) *Chaps. xci.–civ.*—In the preceding section the Maccabees were the religious champions of the nation and the friends of the *Chasidim.* Here they are leagued with the Sadducees, and are the declared foes of the Pharisaic party. This section was written therefore after 134 B.C., when the breach between John Hyrcanus and the Pharisees took place and before the savage massacres of of the latter by Jannaeus (95 B.C.), for it is not likely that in a book dealing with the sufferings of the Pharisees such a reference would be omitted. These chapters indicate a revolution in the religious hopes of the nation. An eternal Messianic kingdom is no longer anticipated, but only a temporary one, at the close of which the final judgment will ensue. The righteous dead rise not to this kingdom, but to spiritual blessedness in heaven itself—to an immortality of the soul.

(4) *Chaps. i.–xxxvi.*—This is the most difficult section of the book. It is very composite. Chaps. vi.–xi. are apparently an independent fragment of the Enoch Saga. It is itself compounded of the Semjaza and Azazel myths, and in its present composite form is already presupposed by lxxxviii.–lxxxix.1; hence its present form is earlier than 166 B.C. It represents a primitive and very sensuous view of the eternal Messianic kingdom on earth, seeing that the righteous beget 1,000 children before they die. These chapters appear to be from the Book of Noah; for they never refer to Enoch, but to Noah only (x.1); xii.–xvi., on the other hand, belong to the Book of Enoch, representing for the most part what Enoch saw in a vision; i.–v. seem to be of a different date and authorship from the rest.

(5) *Chaps. xxxvii.–lxxi.*—These constitute the well-known "Similitudes." They were written before 64 B.C., for Rome was not yet known to the writer, and after 95 B.C., for the slaying of the righteous, of which the writer complains, was not perpetrated by the Maccabean princes before that date. This section consists of three similitudes—xxxviii.–xliv., xlv.–lvii., lviii.–lxix. These are introduced and concluded by xxxvii. and lxx. There are many interpolations—lx., lxv.–lxix.25, confessedly from the Book of Noah; most probably also liv.7–lv.2. Whence others, such as xxxix.1, 2*a*, xli.3–8, xliii. *sq.*, spring is doubtful. Chaps. l, lvi.5–lvii. 3*a* are likewise insertions.

See Charles, *The Book of Enoch* (1912), and in the S.P.C.K. "Translations of Early Documents" (1917); Leszynsky, *Die Sadduzäer* (1912); *Burkitt, Jewish and Christian Apocalypses* (1914).

(W. O. E. O.)

The Book of the Secrets of Enoch, or *Slavonic, Enoch.* This new fragment of the Enochic literature came to light through five mss. discovered in Russia and Servia. Its contents are:

Chaps. i.–ii. Introduction: life of Enoch: his dream, in which he is told that he will be taken up to heaven; his admonitions

to his sons. iii.–xxxvi. What Enoch saw in heaven. iii.–vi. The first heaven; the rulers of the stars; the great sea and the treasures of snow, etc. vii. The second heaven; the fallen angels. viii.–x. The third heaven; Paradise and place of punishment. xi.–xvii. The fourth heaven; courses of the sun and moon; phoenixes. xviii. The fifth heaven; the watchers mourning for their fallen brethren. xix. The sixth heaven; seven bands of angels arrange and study the courses of the stars, etc.; others set over the years, the fruits of the earth, the souls of men. xx.–xxxvi. The seventh heaven; the Lord sitting on His throne with the ten chief orders of angels. Enoch is clothed by Michael in the raiment of God's glory and instructed in the secrets of nature and of man, which he wrote down in 366 books. God reveals to Enoch the history of the creation of the earth and the seven planets and circles of the heaven and of man, the story of the fallen angels, the duration of the world through 7,000 years, and its millennium of rest. xxxviii.–lxvi. Enoch returns to earth, admonishes his sons; instructs them on what he had seen in the heavens, gives them his books. Bids them not to swear at all, nor expect any intercession of the departed saints for sinners. lvi.–lxiii. Methuselah asks Enoch's blessing before he departs, and to all his sons and their families Enoch gives fresh instruction. lxiv.–lxvi. Enoch addressed the assembled people at Achuszan. lxvii.–lxviii. Enoch's translation. Rejoicings of the people on behalf of the revelation given them through Enoch.

A large part of this book was written for the first time in Greek. On the other hand, some sections may wholly or in part go back to Hebrew originals. In its present form the book was written in Egypt, and probably some time between 30 B.C. and A.D. 70. It was written after 30 B.C., for it makes use of Sirach, the (Ethiopic) Book of Enoch and the Book of Wisdom. It was written before A.D. 70; for the temple is still standing, *see* lix.2. The author was an orthodox Hellenistic Jew who lived in Egypt. He believed in the value of sacrifices (xlii.6; lix. 1, 2, etc.), but is careful to enforce enlightened views regarding them (xlv. 3,4; lxi. 4,5.) in the law lii.8,9; in a blessed immortality, l. 2; lxv. 6,8–10, in which the righteous should be clothed in "the raiment of God's glory," xxii.8. In questions relating to cosmology, sin, death, etc., he is an eclectic, and allows himself the most unrestricted freedom, and readily incorporates Platonic (xxx.16), Egyptian (xxv.2) and Zend (lviii.4–6) elements into his system of thought.

See Morfill and Charles, ***The Book of the Secrets of Enoch*** (1896); Forbes and Charles, *Apoc. and Pseudepigrapha* (1912).

(W. O. E. O.; R. H. CH.)

ENOMOTO, BUYO, VISCOUNT (1839–1909), Japanese vice-admiral, was born in Tokyo. He was the first officer sent by the Tokugawa government to study naval science in Europe, and after going through a course of instruction in Holland he returned in command of the frigate "Kaiyō Maru," built at Amsterdam to order of the Yedo administration. The salient episode of his career was an attempt to establish a republic at Hakodate. Finding himself in command of a squadron which represented practically the whole of Japan's naval forces, he refused to acquiesce in the deposition of the Shōgun, and, steaming off to Yezo (1867), proclaimed a republic and fortified Hakodate. He was soon compelled to surrender, but the newly organized government of the empire instead of inflicting the death penalty on him and his principal followers, as would have been the inevitable sequel of such a drama in previous times, punished them with imprisonment only, and four years after the Hakodate episode, Enomoto received an important post in Hokkaido, the scene of his attempt. Subsequently (1874), as envoy in St. Petersburg, he concluded the treaty by which Japan exchanged the southern half of Saghalien for the Kuriles. He received the title of viscount in 1885, and afterwards held the portfolios of communications, education and foreign affairs. He died at Tokyo in 1909.

ENOS, a town of European Turkey, in the vilayet of Adrianople, on the river Maritsa, where its estuary broadens to meet the Aegean sea. Pop. (1905) about 8,000. Enos occupies a ridge of rock surrounded by broad marshes. It was the seat of a Greek bishop, but the Greek population has left and the town is almost completely in ruins, although in 1921 when it was in Greek hands it was largely rebuilt. It long possessed a valuable export trade, owing to its position at the mouth of the Maritsa, the great natural waterway from Adrianople to the sea. But its commerce has declined, owing to the unhealthiness of its climate, to the accumulation of sandbanks in its harbour, which now only admits small coasters and fishing-vessels, and to the rivalry of Dédéagatch, a neighbouring seaport connected with Adrianople by rail. It is crowned by an old castle of the Genoese Gattelusi. Hellenic remains are not uncommon and there are three fine Byzantine churches near the castle.

ENRÍQUEZ GÓMEZ, ANTONIO (*c.* 1602–1662?) Spanish dramatist, poet and novelist of Portuguese-Jewish origin—known also as Enrique Enríquez de Paz—won distinction with his play *A lo que obliga el honor* (1642), but is best represented by *El Siglo Pitagórico y Vida de don Gregorio Guadaña* (1644), a striking picaresque novel in prose and verse, dedicated to the Maréchal de Bassompierre.

ENSCHEDE, in the province of Overysel, Holland, near the German frontier, and a junction 5 m. S.E. of Hengelo. Pop. (1927) 46,748. It is the centre of the flourishing cotton-spinning and weaving industries of the Twente district; while by the railway via Gronau and Koesfeld to Dortmund it is in direct communication with the Westphalian coalfields. Enschede possesses an industrial trade school, and a large park used as a recreation ground for its growing population. About two-thirds of the town was burnt down in 1862.

ENSEMBLE (Fr.), in music, signifies the combination of several performers, vocal or instrumental, as in the "ensemble numbers" of an opera (trio, quartet and so forth). By extension, the term is applied further to the process of combining in this manner and to the degree of skill with which it is accomplished. Thus in this sense it may be said that the ensemble of a choir or of a quartet was poor.

ENSENADA, CENON DE SOMODEVILLA, MARQUES DE LA (1702–1781), Spanish statesman, was born at Alesanco near Logroño on June 2, 1702. He entered the civil service, and was employed on various important missions. In 1736 Charles, afterwards King Charles III. of Spain, conferred on him the Neapolitan title of Marques de la Ensenada. In 1742 he became secretary of State and war to Philip, duke of Parma. In the following year (April 11, 1743), on the death of Patiños's successor Campillo, he was chosen by Philip V. as minister of finance, war, the navy and the Indies (*i.e.*, the colonies), and became, in fact prime minister at the age of forty-one. During the remainder of the king's reign, which lasted till July 11, 1746, and under his successor Ferdinand VI. until 1754, Ensenada was the effective prime minister.

His administration is notable in Spanish history for the vigour of his policy of internal reform. Under his direction the despotism of the Bourbon kings became paternal. Public works were undertaken, shipping was encouraged, trade was fostered, numbers of young Spaniards were sent abroad for education. Many of them abused their opportunity, but on the whole the prosperity of the country revived, and the way was cleared for the more sweeping innovations of the following reign. Ensenada was a strong partisan of a French alliance and of a policy hostile to England. Sir B. Keene, the English minister, supported the Spanish court party opposed to him, and succeeded in preventing him from adding the foreign office to others which he held. Ensenada would probably have fallen sooner but for the support he received from the Portuguese queen, Barbara. In 1754 he offended her by opposing an exchange of Spanish and Portuguese colonial possessions in America which she favoured. On July 20, he was arrested by the king's order, and sent into mild confinement. On the accession of Charles III. in 1759, he was released from arrest and allowed to return to Madrid. On April 18, 1766 he was again exiled from court, and ordered to go to Medina del Campo. He had no further share in public life, and died on Dec. 6, 1781.

For his administration *see* W. Coxe, ***Memoirs of the Kings of Spain of the House of Bourbon*** (1815), but the only complete account of

Ensenada is by Don Antonio Rodríguez Villa, *Don Cenón de Somodevilla, Marqués de la Ensenada* (Madrid, 1878).

ENSIGN. The word is derived through the Fr. *enseigne* from the Latin plural *insignia*, a distinguishing token, emblem or badge such as symbols of office, or in heraldry, the ornament or sign, such as the crown, coronet or mitre borne above the charge or arms. The word is more particularly used of a military or naval standard or banner. In the British navy, ensign has a specific meaning, and is the name of a flag having a red, white or blue ground, with the Union Jack in the upper corner next the staff. The white ensign (which is further distinguished by having a red St. George's Cross quartered upon it) may only be used by the Royal Navy and the Royal Yacht Squadron, while the blue and red ensigns are the badges of the Royal Naval Reserve, some privileged companies, and the Mercantile Marine, respectively (*see* FLAG).

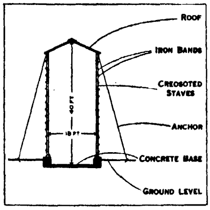
Until 1871 the lowest grade of commissioned officers in the infantry of the British army had the title of ensign (now replaced by that of second lieutenant). The title is still used within the Foot Guards. It is the duty of the officers of this rank to carry the colours of the regiment (*see* COLOURS, MILITARY). In the 16th century ensign was corrupted into "ancient," and was used in the two senses of a banner and the bearer of the banner. In the United States navy, the title ensign superseded in 1862 that of *passed midshipman*. It designates an officer ranking with second lieutenant in the army.

ENSILAGE, the process of preserving green crops in a succulent condition in a silo, *i.e.*, a pit, a stack or a tall cylindrical tower above ground (from Gr. σιρός, Lat. *sirus*, a pit for holding grain). The fodder which is the result is called silage.

The method seems to have been practised in Central Europe (its principles are similar to those involved in the making of sauerkraut) when special attention was first directed to it by Auguste Goffart, a French agriculturist, who in 1877 published a work (*Manuel de la culture et de l'ensilage des maïs et autres fourrages verts*) detailing the experiences of many years in preserving green crops in silos. A translation of Goffart's book by J. B. Brown was published in New York in 1879. This attracted considerable attention in the United States, where the practice was then in its infancy. With the development of the tower silo and the investigations of S. M. Babcock, of Wisconsin, and others the practice has become the main source of succulent fodder for winter feeding in America and in other parts of the world where labour is costly. In the United Kingdom, following the disastrously wet year, 1879, and investigations by George Fry, of Chobham, the practice was widely tried, but under the conditions then prevailing proved unsuccessful. It was revived by George Jaques, of Tivetshall, Norfolk, who, in 1912, introduced the tall America tower silo, and aided by investigations at Cambridge and elsewhere the practice shows slow but steady growth.

Conditions for Silage.—The conditions necessary for the proper preservation of silage are exclusion of air after fermentation is complete, and the presence of carbonic acid gas and certain organic acids formed by the fermentation of the silage, which together prevent the development of moulds on the succulent fodder. Several organic acids are commonly present including acetic acid (the acid of vinegar), lactic acid (the acid of sour milk) and butyric acid (the acid of rancid butter). These to a large extent determine the quality of the silage. If butyric acid predominates it always results in an evil-smelling silage commonly called "sour." This type of silage is generally produced when one of two conditions prevail, either the ensiling of an immature and very succulent crop, when the fodder packs so tightly in the silo that the proper fermentation is prevented by insufficient air, or the use of crop that has been "laid" or "lodged" and has partially rotted in the field, in which case the decomposition continues in the silo. Partial drying of such crops before ensiling will serve to prevent the formation of butyric acid and "sour" silage. If air has free access to the fermenting fodder during ensilage, much heat is produced. When the temperature exceeds 45° C a pleasant sweet-smelling silage is produced, commonly called "sweet" silage. Such silage is frequently found in silage stacks and may be found close to the top of a tower silo, in both these cases air having easy access during fermentation. If the fodder when ensiled is reasonably mature, and the supply of air during fermentation is controlled by close packing, the resulting silage has the smell of acetic acid, and is then described as "acid" silage. This type is the usual product of tower silos and silage clamps.

The most suitable crops for silage in Britain are mixtures containing pulse and cereals and, in suitable localities, maize. In warmer climates maize is used almost exclusively. Meadow grass and sown grass mixtures can advantageously be made into silage when weather conditions prevent hay-making, but cruciferous crops (mustard, turnip, cabbage, etc.) are not suitable. On heavy soils and in districts of considerable rainfall the best mixture is composed largely of beans, with a light seeding of tares or peas and oats of a straw-producing variety. This mixture produces heavy crops which, owing to the robust stems of the beans, stand well, smother weeds and are easy to harvest. On light soils in a dry district beans are unsuitable. In this case a mixture of oats and tares alone is more suitable, but again the proportion of tares must not be too large lest the climbing stems and weight of the tares cause the whole crop to be "laid" on the ground. Maize can only be grown satisfactorily on warm soils in early districts, and even then care must be taken to use suitable varieties which ripen early. The varieties commonly grown in Britain for green soiling are unsuitable because they do not mature early enough. At the time of ensiling maize should be so mature that the fully formed cobs contain grains which are firm and glazed. The most suitable varieties are Jaune Gros du Domaine, a French variety, and to a lesser extent Salzer's North Dakota and Longfellow, which are American varieties.



SECTION OF A SILO BUILT WITH CREOSOTED WOOD STAVES, STRENGTHENED WITH IRON BANDS; LARGELY USED IN AMERICA FOR CORN ENSILAGE

Value of Silage.—Well made silage is a wholesome and nutritious food for all classes of cattle. Live stock—weaning calves, baby beeves and milking cows—all thrive upon it, digest it readily, and keep in good coat and condition when fed upon it. It is an equally suitable food for sheep, though not quite so easily fed to them as to cattle. Horses eat it readily when fed in small quantity with their chaff; being fibrous, silage is not very suitable for pigs.

It can be fed, if required, immediately it is made, or in times of plenty it can be stored in the silo for indefinite periods without depreciation, provided air is excluded. In silage stacks and clamps air cannot be completely excluded, and therefore continuous wastage is occasioned by storage. Digestibility experiments have shown that well made silage possesses a feeding value in accordance with that suggested by its chemical analysis, and feeding experiments have confirmed this fact. In one series of experiments by H. E. Woodman at Cambridge, in which parts of the same oat and tare crop cut at the same time, were fed firstly as green crop, secondly as hay, and thirdly as silage, it was shown that the food value of the silage was equal to the green crop and greater than that of the hay.

Types of Silo.—A typical modern silo is a cylindrical structure made of wood, concrete or iron, varying in diameter between 12 and 20 ft. and in height between 30 and 45 feet. Silos constructed of concrete are generally more costly to erect than those of iron or wood, but are more durable if suitably reinforced. Wooden silos require more annual attention to keep them in order, and iron silos require to be painted annually inside to preserve the walls from the effects of the acids in the silage. The effective capacity of silos may be calculated by first deducting from the height of the silo about 4 ft., the approximate depth left vacant after the silage has settled. The cubical contents of the remainder of the silo in feet multiplied by 40 lb., the average

weight of a cubic foot of silage, will give the effective capacity. Tall silos are filled by power-driven silage cutters, which first cut the fodder into short lengths and then elevate it to the top of the silo by blowing it through hollow tubes.

Stack silage by reason of the large surface exposed to the air is liable to continuous moulding and consequently to considerable wastage from decay. For this reason it is not suitable for general adoption in ordinary farm practice. But it involves no capital outlay and can be brought into play at a moment's notice. It is therefore a useful method of saving hay crops in seasons when hay-making is rendered impossible or difficult by continuous rain. Clamp silage is liable to similar though smaller losses. It, too, involves little time or outlay in preparing the clamp. The site for the clamp must be carefully chosen lest the clamp becomes full of water in winter. This method may be adopted in regular farm practice, as, for example, with maize in South Africa, where subsoil water is not troublesome, or less frequently in Britain with mixed crops. Like stack silage it may also be used to save hay crops in adverse seasons.

In general it may be said that silage making lends itself to industrial conditions of management more than most farming processes, and for this reason the practice is likely to secure a permanent place in agriculture.

L. Wright (Salem [O.], 1917); *Ensilage* (Misc. Publ. No. 53, Board of Agric. and Fisheries, 1926); L. Brétignière et J. Godfernaux, *L'ensilage des fourrages verts*, (Librairie agricole de la maison rustique). (A. A.)

The United States.—Maize (Indian corn) is the principal American silage crop and probably constitutes more than 90% of the total amount. Where climatic conditions are favourable it produces more actual food material per acre than any other crop that can be grown. Ordinarily, maize should be harvested for silage about a week or ten days before it would be cut for shocking. At this time the kernels are well dented and glazed. Since there is a steady increase in all the nutrients of the crop up to maturity, it is best to plant a variety that will mature sufficiently for silage before frost. In any locality the variety most commonly raised for corn will ordinarily give the best results for silage. This means the use of short-season varieties in the north and long-season varieties in the south.

Next to maize the sorghums, both saccharine and non-saccharine, constitute the most satisfactory silage crop. Being somewhat more drought resistant than maize, they are generally used where the rainfall is rather limited and also in some of the hot, irrigated districts where maize does not thrive. In feeding value good sorghum silage is nearly equal to maize silage. In recent years sunflowers have received considerable attention as a silage crop especially in the extreme north where the seasons are too short and too cool for maize. The silage is much less palatable but after the animals become accustomed to the flavour they eat considerable quantities of it and seem to do well. Legumes alone have not proved altogether satisfactory as a silage. In some cases they have yielded a palatable product; in others a silage that was rank flavoured and not relished by cattle. One reason for this failure is the higher water content. For this reason such crops should be allowed to become as mature as practicable before ensiling, or if cut earlier, should be allowed partially to cure. Mixtures of maize and legumes make excellent silage. Small grains, peas and oats mixed, beet tops, cane tops, rape, etc., are ensiled in a limited way with a fair degree of success.

In the United States the stack silage is used chiefly in putting up refuse from pea canneries. This method of preserving fodder in a succulent state has also been employed occasionally with maize and sweet clover. The pit or trench silos are employed chiefly in those regions where the rainfall is rather limited. In locating such silos it is essential that they be placed in firm, dry and well-drained soil, otherwise there is danger of spoilage through accumulation of water in the pit. The advantages of the pit and trench silos are that they are cheap, easily constructed, will not blow down, and do not require the silage blower in filling.

The preservation of forage as silage possesses a number of advantages, especially with coarse plants like maize and sorghum. Among these advantages are: (1) Silage preservation saves all of the forage in edible form. The loss both in preserving and feeding is much smaller than with dry fodder. (2) Silage is more palatable than dry fodder and animals will eat a larger quantity. (3) Silage preservation is not dependent upon favourable weather conditions. (4) Silage requires less space for storage than the equivalent amount of hay or fodder. (5) The cost of the ration is materially reduced by feeding ensilage to all classes of live stock.

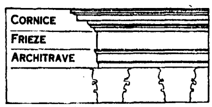
ENSTATITE, a rock-forming mineral belonging to the group of orthorhombic pyroxenes. It is a magnesium metasilicate, $MgSiO_3$, often with a little iron replacing the magnesium. As the iron increases in amount there is a transition to bronzite (*q.v.*), and with still more iron to hypersthene (*q.v.*). Enstatite was first described by G. A. Kenngott in 1855, and named from ἐνστάτης "an opponent," because the mineral is almost infusible before the blowpipe; the material he described consisted of imperfect prismatic crystals, previously thought to be scapolite, from the serpentine of Mt. Zdjar near Schönberg, Moravia. Crystals suitable for goniometric measurement were later found in the meteorite which fell at Breitenbach, Bohemia. Large crystals, a foot in length and almost altered to steatite, were found in 1874 in the apatite veins transversing mica-schist and hornblende-schist at the apatite mine of Kjörrestad, near Brevig, Norway.

The compound obtained from dry melts of the composition $MgSiO_3$ is not enstatite, but a monoclinic mineral clinoenstatite known only in meteorites. Clinoenstatite appears to be the stable modification of $MgSiO_3$ at all temperatures below its incongruent melting point. It melts with decomposition at 1,557°C., with formation of forsterite. Enstatite itself above 1,260°C., is converted into clinoenstatite. It has been crystallized from melts with albite and sodium silicate and obtained as an unstable phase from $MgSiO_3$ glasses at a temperature of 1,000°–1,100°C. The limited miscibility of enstatite with diopside indicates that enstatite and clinoenstatite are distinct minerals, for the latter forms a complete series of solid solutions with the monoclinic pyroxene. Intergrowths of enstatite and clinoenstatite are known in meteorites. The rhombic pyroxene alters in nature to a lamellar serpentine known as bastite. The chief mode of occurrence of the mineral is as a constituent of basic igneous rocks—norites, pyroxenites, and some peridotites, and in dolerites and basalts. (C. E. T.)

ENTABLATURE, in architecture, the assemblage of horizontal mouldings and bands, supported by, and immediately above, the columns of classic buildings, or similar forms in any other style (*see* ORDER). It is usually divided into three main portions; the lowest, called the architrave (*q.v.*), originally the beam running from support to support; the central one called a frieze (*q.v.*), consisting of an unmoulded band with or without ornament; and the topmost, called the cornice (*q.v.*), formed of a series of mouldings that project from the face of the frieze. Occasionally, in Greek and Renaissance work, the frieze is omitted, as in the caryatid porch of the Erectheum at Athens. In Georgian and American colonial work, the architrave is sometimes omitted, as in many of the designs of Robert Adam.



ENTABLATURE

ENTADA, in botany, a woody climber belonging to the family Leguminosae and common throughout the tropics. The best-known species is *Entada scandens,* the nicker bean or sword bean, so called from its large woody pod, 2 to 4 ft. long and 3 to 4 in. broad, which contains large, flat, hard, polished, chestnut-coloured seeds, often made into snuff-boxes or match-boxes. A preparation from the kernel is used as a drug by the natives in India. The seeds will float for long in water, and are often thrown up on the north-western coasts of Europe, having been carried by the Gulf Stream from the West Indies; they retain their vitality, and under favourable conditions will germinate.

ENTAIL. The law of entail was initiated in England by the Statute of Westminster the second (1285) in the chapter headed *De Donis Conditionalibus.* Strictly speaking, a form of entail was known before the Norman feudal law had been introduced into England. The common form was a grant "to the feoffee and the heirs of his body." These grants were also known as *feuda conditionata,* because if the donee had no heirs of his body the estate reverted to the donor. The donee could, however, if he had an heir of the body born alive, alienate the land, and defeat the right of the donor. Since the passing of the above statute an estate given to a man and the heirs of his body has been known as an estate tail, or an estate in fee tail, the word tail being derived from the French *tailler,* to cut, the inheritance being by the statute cut down and confined to the heirs of the body. The power of alienation was re-introduced by the judges in Taltarum's case (*Year Book,* 12 Edward IV., 1472) by means of a fictitious suit or recovery which had originally been devised by the regular clergy for evading the statutes of mortmain. This was abolished by an act passed in 1833. (*See* ESTATE; FINE.) A deed enrolled in the central office of the Supreme Court was substituted, but by the Law of Property Act 1925 the necessity of enrollment was abolished. Disentailment by a tenant in tail in remainder still requires the consent of the protector, generally the tenant for life, required by the act of 1833. By s. 176 of the Law of Property Act 1925 a tenant in tail in possession, by following the terms of the section, may dispose of the estate by will as if he had been absolute owner of it as an equitable interest at his death. Under the same act an estate in tail is now an equitable estate only (s.39) and an entailed interest may be created even in personal property (s.130).

ENTASIS, in architecture, the convex curve given to the taper of a column, spire or similar upright member, in order to avoid any appearance of hollowness or weakness. Entasis is almost universal in classic columns. It is exaggerated in Greek archaic Doric work, but grows more and more subtle during the 5th and 4th centuries B.C. Many attempts have been made to find a mathematical basis for the entasis, and it has been reduced to all kinds of elliptical, hyperbolic, parabolic and even cycloidal curves. The immense variety of forms found indicates, probably, that the curve was laid out free-hand and purely empirically. Entasis is occasionally found in Gothic spires, and in the smaller Romanesque columns.

ENTELECHY, a term used by Aristotle for that which realizes or makes actual the otherwise merely potential. The idea which is expressed by the term entelechy (ἐντελέχεια) is intimately connected with Aristotle's distinction between matter and form, or the potential and actual. Briefly, one may say that he analysed each thing into the stuff or elements of which it is composed and the form or the order in which they are arranged. The mere stuff or matter is not yet the real thing, it needs what is variously described as a certain form or essence or function to complete it; only it must be remembered that matter and form are never separated; they can only be distinguished. So, *e.g.,* in the case of a living organism one may distinguish the mere matter of the organism (as though it were a mere synthesis of inorganic substances, one might almost say) from a certain form or essence or function or inner activity without which it would not really be a living organism at all; and this "soul" or vital function, as it may be called, is what Aristotle calls the "entelechy" (or first entelechy) of a living organism. Similarly, in the case of man rational activity is what makes him really a man, as distinguished from a mere animal, and so on. Leibniz, following Aristotle, called his "monads" (or spiritual substances) entelechies, in virtue of their inner self-determined activity. And more recently the term has been revived by H. Driesch in connection with his vitalistic biology to denote an interval perfecting principle which, he supposes, exists in all living organisms. (*See* ARISTOTLE, LEIBNITZ, FORM, VITALISM, EVOLUTION.)

ENTERIC FEVER, a name often given to typhoid fever (*q.v.*). When physicians separated from typhus fever a group of cases having special features they called the latter "typhoid." As the distinction between typhus and typhoid fevers became better recognized a tendency arose to replace the name "typhoid" by "enteric" as indicating the predominant intestinal lesions. In time it was recognized that "enteric" fever was not a single disease but that more or less identical symptoms were caused by different varieties of bacilli. Hence arose the modern differentiation of enteric fever into typhoid fever and three varieties of paratyphoid fever, each of the four conditions being dependent upon a special variety of bacillus, viz., B. typhosus, B. paratyphosus A, B. paratyphosus B, and B. paratyphosus C. In epidemiology and other conditions in which this differentiation is not or cannot be made "enteric" is used as a group term.

ENTERITIS, a general medical term for inflammation of the bowels, often associated with gastritis and dependent upon bacterial infection conveyed by food, but also resulting from irritant poisons, *e.g.,* copper sulphate.

ENTEROPNEUSTA, a class of Protochordates. *See* BALANOGLOSSUS; PTEROBRANCHIA.

ENTEROZOA, a zoological term, now obsolete, for all animals other than Protozoa (*q.v.*); the reference is to the possession of an enteron or body-cavity. The word is now replaced by Metazoa (*q.v.*).

ENTERTAINMENTS DUTY. This particular form of the taxation of luxuries was adopted by the parliament of the United Kingdom as a means of raising further revenue during the World War. The duty was imposed by the Finance (New Duties) act, 1916, sec. 1 of which provides that as from May 15, 1916, a duty is to be charged on all payments for admission to any entertainment as defined by the act, at the rates specified. The rates of duty were varied by subsequent acts, but the scheme of the duty as laid down in the Act of 1916 has not been substantially altered, and remains as a description of the principles under which the tax has continued to be collected. The machinery by which the duty is levied is provided by an enactment that no person is to be admitted for payment to any entertainment except with a ticket stamped with a stamp denoting that the proper duty has been paid, or (in special cases with the approval of the commissioners of customs and excise) through a barrier which automatically registers the number of persons admitted. An exception is made in cases where the proprietor of the entertainment makes arrangements approved by the authorities for furnishing returns of the payments made for admission, and gives security for the due payment of the duty.

"Entertainment" includes any exhibition, performance, amusement, game or sport to which persons are admitted for payment. The duty, however, is not charged in any of the following cases:

(*a*) Where the whole of the takings are devoted to philanthropic or charitable purposes without any charge on the takings for any expenses of the entertainment; (*b*) Where the entertainment is of a wholly educational character or is provided by a school not conducted for profit; (*c*) Where the entertainment is intended only for the amusement of children and the charge for admission does not exceed one penny per head; (*d*) Where the entertainment is provided for educational or scientific purposes by a society not seeking to make profit, or with the object of reviving national pastimes. If the whole of the proceeds are devoted to philanthropic or charitable purposes, and the expenses of the entertainment do not exceed 30% of the receipts, the duty paid is repaid to the proprietor on proof of the facts. A "proprietor" for the purposes of the duty is defined as including any person responsible for the management of the entertainment.

The duty is not charged in respect of entertainments consisting solely of an exhibition (1) of the products of an industry, or of materials, machinery, appliances or foodstuffs used in the production, or displays of skill by workers in the industry; or (2) of works of graphic art, sculpture, and arts craftsmanship, executed and exhibited by persons who practise graphic art, sculpture or arts craftsmanship for profit and as their main occupation, or of displays of skill by such persons in such arts or crafts; or (3) of articles or displays of skill which are of material interest in connection with the public health. Failure to comply with the requirements of the act involves the person admitted in a penalty of £5, and the proprietor in a penalty of £50 in respect of each offence. In the case of subscriptions to clubs or societies which include the right of admission to entertainments, the duty is payable on the amount of the subscription or on such part thereof as the commissioners consider to represent the right of admission to entertainments. Rent paid primarily for the purpose of securing admission to an entertainment (*e.g.*, the rent of a box at the opera) is chargeable to the duty.

It has been held by the courts in England that a musical performance provided during a meal to the guests at a restaurant is not an entertainment within the meaning of the act. On the other hand, where a Masonic festival was held which consisted of a dinner followed by a concert, the concert was held to be an entertainment.

The rate of duty depends upon the amount of the payment for admission. The rates have varied from time to time. Those in force in 1928 were as follows:

Payment exceeding	6d. but not exceeding	7d.	— 1d.
" "	7 " " "	8	— 1½
" "	8 " " "	1/1	— 2
" "	1/1 " " "	1/3	— 3
" "	1/3 " " "	2/0	— 4
" "	2/0 " " "	3/0	— 6
" "	3/0 " " "	5/0	— 9
" "	5/0 " " "	7/6	—1/-
" "	7/6 " " "	10/6	—1/6
" "	10/6 " " "	15/0	—2/-
" "	15/0—2/0 for the first	15/- and 6d. for every 5/- or part of 5/- over 15/-.	

The annual yield of the tax is about £5,750,000.

(J. S. S.)

ENTHUSIASM, a word originally meaning inspiration by a divine afflatus or by the presence of a god. The Gr. *ἐνθουσιασμός*, from which the word is adapted, is formed from the verb *ἐνθουσιάζειν*, to be *ἔνθεος*, possessed by a god (*θεός*). Applied by the Greeks to manifestations of divine "possession," by Apollo, as in the case of the Pythia, or by Dionysus, as in the case of the Bacchantes and Maenads, it was also used in a transferred or figurative sense; thus Socrates speaks of the inspiration of poets as a form of enthusiasm (Plato, *Apol. Soc.* 22 C). Its uses, in a religious sense, are confined to an exaggerated or wrongful belief in religious inspiration, or to intense religious fervour or emotion. In England, and more especially in the 18th century, Enthusiasm was the term applied, not without a suggestion of suspicion or contempt, to emotional or fanatical religion. Enthusiasm, says Locke, is "founded neither on reason nor divine revelation," but rises "from the conceits of a warmed or over-weening brain"; it is, says Johnson, "A vain belief of private revelation; a vain confidence of divine favour or communication." But in modern usage enthusiasm has lost its peculiar religious significance, and means a whole-hearted devotion to an ideal, cause, study or pursuit.

ENTHYMEME, in formal logic, the technical name of a syllogistic argument which is incompletely stated. Any one of the propositions may be omitted, but in general it is that one which is most obvious or most naturally present to the mind. In point of fact the full formal statement of a syllogism is rare, especially in rhetorical language, when the deliberate omission of one of the propositions has a dramatic effect. Thus the suppression of the conclusion may have the effect of emphasizing the idea which necessarily follows from the premises. Far commoner is the omission of one of the premises which is either too clear to need statement or is such that its omission is desirable. This use of the word differs from Aristotle's original application of it to a syllogism based on probabilities or signs (*ἐξ εἰκότων ἢ σημείων*); *i.e.*, on propositions which are generally valid (*εἰκότα*) or on particular facts which may be held to justify a general principle or another particular fact (*Anal. prior β* xxvii. 70 a 10).

See text-books on logic; Sir W. Hamilton's *Discussions;* Mansel's ed. of *Aldrich*, Appendix F; H. W. B. Joseph, *Introd. to Logic;* A. Wolf, *Essentials of Logic* (1926).

ENTOMOLOGY (Gr. *ἔντομα*, insects, and *λόγος*, a discourse), the science that treats of insects, *i.e.*, of the animals included in the class Insecta of the great phylum Arthropoda. The term, however, is somewhat elastic in its current use, since students of centipedes and spiders are often reckoned among entomologists. As the number of species of insects is believed to exceed that of all other animals taken together, it is no wonder that their study should form a special division of zoology.

Beetles (Scarabaei) are the subjects of some of the oldest sculptured works of the Egyptians, and references to locusts, bees and ants are familiar to all readers of the Hebrew scriptures. The interest of insects to the eastern races was, however, economic, religious or moral. The science of insects began with Aristotle, who included in a class "Entoma" the true insects, the arachnids and the myriapods, the Crustacea forming another class ("Malacostraca") of the "Anaema" or "bloodless animals." For nearly 2,000 years the few writers who dealt with zoological subjects followed Aristotle's lead.

The foundations of modern entomology were laid by a series of wonderful memoirs on anatomy and development published in the 17th and 18th centuries. Of these the most famous are M. Malpighi's treatise on the silkworm (1669) and J. Swammerdam's *Biblia naturae*, issued in 1737, 50 years after its author's death, and containing observations on the structure and life-history of a series of insect types. Aristotle and Harvey (*De generatione animalium*, 1651) had considered the insect larva as a prematurely hatched embryo and the pupa as a second egg. Swammerdam, however, showed the presence under the larval cuticle of the pupal structures. His only unfortunate contribution to entomology—indeed to zoology generally—was his theory of pre-formation, which taught the presence within the egg of a perfectly formed but miniature adult. A year before Malpighi's great work appeared, another Italian naturalist, F. Redi, had disproved by experiment the spontaneous generation of maggots from putrid flesh, and had shown that they can only develop from the eggs of flies.

Meanwhile the English naturalist, John Ray, was studying the classification of animals; he published, in 1705, his *Methodus insectorum*, in which the nature of the metamorphosis received due weight. Ray's "Insects" comprised the Arachnids, Crustacea, Myriapoda and Annelida, in addition to the Hexapods. Ray was the first to formulate that definite conception of the species which was adopted by Linnaeus and emphasized by his binominal nomenclature. In 1735 appeared the first edition of the *Systema naturae* of Linnaeus, in which the "Insecta" form a group equivalent to the Arthropoda of modern zoologists, and are divided into seven orders, whose names—Coleoptera, Diptera, Lepidoptera, etc., founded on the nature of the wings—have become firmly

established. The fascinating subjects of insect bionomics and life-history were dealt with in the classical memoirs (1734–42) of the Frenchman, R. A. F. de Réaumur, and (1752–78) of the Swede, C. de Geer. From the 18th century until the present day, it is only possible to enumerate the outstanding features in the progress of entomology. In the realm of classification, the work of Linnaeus was continued in Denmark by J. C. Fabricius (*Systema entomologica*, 1775), and extended in France by G. P. B. Lamarck (*Animaux sans vertèbres*, 1801) and G. Cuvier (*Leçons d'anatomie comparée*, 1800–05), and in England by W. E. Leach (*Trans. Linn. Soc.* xi., 1815). These three authors definitely separated the Arachnida, Crustacea, and Myriapoda as classes distinct from the Insecta. The work of J. O. Westwood (*Modern Classification of Insects*, 1839–40) connects these older writers with their modern successors. Among the latter F. Brauer (1885) laid the foundations of the system of classification used to-day and recognized the fundamental division of insects into the two subclasses Apterygota and Pterygota. Further advances were made by D. Sharp (1899), who first showed the importance of external and internal methods of wing-growth in classification, and other systems were formulated by C. Börner (1904) and A. Handlirsch (1908).

In the anatomical field the work of Malpighi and Swammerdam was at first continued most energetically by French students. P. Lyonnet had published in 1760 his elaborate monograph on the goat-moth caterpillar, and H. E. Strauss-Dürckheim in 1828 issued his great treatise on the cockchafer. But the name of J. C. L. de Savigny, who (*Mém. sur les animaux sans vertèbres*, 1816) established the homology of the jaws of all insects whether biting or sucking, deserves especial honour. Many anatomical and developmental details were carefully worked out by L. Dufour (in a long series of memoirs from 1811–60) in France, by G. Newport ("Insecta" in *Encyc. Anat. and Physiol.*, 1839) in England, and by H. Burmeister (*Handbuch der Entomologie*, 1832) in Germany. Through the 19th century, as knowledge increased, the work of investigation became necessarily more and more specialized. Anatomists like F. Leydig, F. Müller, B. T. Lowne and V. Graber investigated in detail some one species or special points in the structure of some particular organs, using in elucidation the ever-improving microscopical methods of research. These investigators were followed by researchers in various fields; among the more notable, B. Grassi, J. Kunckel d'Herculais, A. S. Packard, A. Berlese and F. Silvestri. One of the most important advances in general entomology is due to J. H. Comstock who, with his collaborator, J. G. Needham, laid the foundations of our modern conception of wing-venation, replacing the existing chaos by an orderly system. Among other important landmarks are N. Wagner's discovery of paedogenesis in the gall midge *Miastor* (1863): P. Marchal's discovery of polyembryony in the Chalcids (1898) and F. Silvestri's subsequent researches in that subject. The last mentioned investigator's discovery of the obscure orders Protura in 1907 and the Zoraptera in 1913 is also notable. The difficult subject of the internal changes undergone in the late larva and pupa during metamorphosis is essentially a modern study. Since A. Weismann (1864), J. Van Rees (1885) and A. Kowalevski (1871) laid the basis of these investigations, notable advances have been made by J. Anglas (1900), C. Perez (1902–20), A. Berlese (1900) and others.

The embryology of insects is entirely the study of the last century. C. Bonnet indeed observed in 1745 the virgin reproduction of Aphides, but it was not until 1842 that R. A. von Kolliker described the formation of the blastoderm in the egg of the midge *Chironomus*. Later A. Weismann traced details of the growth of embryo and pupa among Diptera, and A. Kowalevski, in 1871, first described the formation of the germ layers in insects. Further progress in embryology resulted from improvements in technique, and in Germany the subject has attracted a large band of workers among whom V. Graber, K. Heider, R. Heymons, O. Bütschli and H. Henking, may be mentioned. In Russia, N. Kholodkovski was an early embryologist of note and in the United States the researches of W. M. Wheeler are important.

The work of de Réaumur and de Geer in the bionomics and life-history of insects has been continued by numerous observers, among whom may be specially mentioned in France E. Perris, J. H. Fabre, C. Janet and C. Ferton. In England the early workers, W. Kirby and W. Spence, were followed by J. Lubbock (Lord Avebury), L. C. Miall, D. Keilin and others. In the United States a large number of life-histories were elucidated by C. V. Riley; A. S. Packard studied the Lepidoptera, while, concerning Hymenoptera, W. M. Wheeler and G. W. and E. G. Peckham made significant contributions. Experimental entomology is a relatively new and growing subject attracting many workers to-day. M. Standfuss, F. Merrifield and E. B. Poulton have studied problems of coloration in this connection, while the effects of temperature and other factors have been investigated by P. Batchmejew and others. The past history of insects has also attracted attention. One of the first significant contributions was made by O. Herr (1847–53); S. H. Scudder has studied the insect remains in American rocks, while in Europe, C. Brongniart and A. Handlirsch are outstanding names; fossils of Australia and elsewhere have been studied with conspicuous ability by R. J. Tillyard.

In the last 30 years or so there have been remarkable developments in the study of insects in relation to man and his welfare, and the subject of Economic Entomology (*q.v.*) has assumed a position of commanding importance. The investigations of insects from the purely utilitarian aspect has also proved a far reaching stimulus to entomology, which to-day can claim a larger band of students and devotees than any other branch of zoology.

After the publication of C. Darwin's *Origin of Species* (1859) a fresh impetus was given to entomology as to all branches of zoology, and it became generally recognized that insects form a group convenient and hopeful for the elucidation of certain problems of animal evolution. The writings of Darwin himself and of A. R. Wallace (both at one time active entomological collectors) contain much evidence drawn from insects in favour of descent with modification. The phylogeny of insects has since been discussed by F. Brauer, A. S. Packard, A. Handlirsch and many others; mimicry and allied problems of coloration by H. W. Bates, F. Müller, E. B. Poulton, M. C. Piepers, and G. A. K. Marshall; the bearing of insect habits and structure on theories of selection by A. Weismann, G. W. and E. Peckham, G. H. T. Eimer and others: variation was the subject of studies by W. Bateson and M. Standfuss; while problems of heredity have been investigated through the medium of insects by T. H. Morgan and his colleagues, L. Doncaster, R. Goldschmidt and others.

Societies for the discussion and publication of papers on entomology became established as the number of students grew larger. The Société Entomologique de France was founded in 1832 and the Entomological Society of London in 1833, similar societies were founded in Breslau in 1839, Holland in 1845, Belgium in 1855, while one of the first American societies was that of Philadelphia, founded in 1859. In Europe the development and progress of such societies have been largely due to the efforts of men who devoted their leisure time to entomology, though in America it is the professional entomologist who figures largest in such activities. Recognition of the scientific and educational value of entomology as a branch of zoology is a very recent development and has in the main been stimulated by the growing importance of the economic aspects of the subject.

The great amount of literature on entomology that appears annually in various languages far exceeds that on any other branch of zoology. H. A. Hagen's *Bibliotheca Entomologica* (Leipzig, 1862–63) catalogues all publications up to 1863, while the yearly volumes of the *Zoological Record*, commencing in 1864, keep the student abreast of the times. An account of the labours of Malpighi, Swammerdam, and other early entomologists is given in L. C. Miall's *Lives of the Early Naturalists* (1912) and in L. F. Henneguy's *Les Insectes* (1904). Among scientific periodicals devoted to general entomology the *Transactions of the Entomological Society of London* and the *Entomologist's Monthly Magazine* are the leading English journals. In France the *Bulletin and Annales de la Société Entomologique de France* occupy first place. Among North American periodicals the *Canadian Entomologist*, *Proceedings of the Entomological Society of Washington*, and the *Annals of the Entomological Society of America* may be mentioned. References to the chief literature on entomology are given in the article INSECTS and in those articles devoted to the separate orders.

(G. H. C.; A. D. I.)

ECONOMIC ENTOMOLOGY

Economic entomology is the name given to the study of insects in their relations to man, his domestic animals and crops, and of the practical methods by which the activities of the injurious species may be counteracted. The subject also takes into account those insects that are beneficial to man, either with respect to certain economic products which they yield, such as silk, wax and lac, or as agents in controlling other insects which have injurious propensities. It is convenient, therefore, to deal with insects of economic importance under two categories; *i.e.*, species that are injurious and those which are beneficial.

INJURIOUS INSECTS

Injurious insects include members of almost all orders and comprise species which destroy cultivated plants and forest trees, others which injure grain and stored products, manufactured goods and raw materials; there are again species which infest domestic animals as well as those which molest or harm man himself. An idea of the losses occasioned by insect pests may be gained from the following figures. The Mexican cotton-boll weevil is estimated to cost the cotton-growing States of North America from £20,000,000 to £30,000,000 annually; the codling moth causes over £2,400,000 loss to fruit growers in the United States each year; rice leaf-hoppers in 1914 entailed a loss of nearly £1,000,000 in one division only of the Central Provinces of India. In Great Britain the ox warble fly has been estimated to injure hides to the extent of £400,000 per annum and the frit fly to destroy eight bushels of oats in each acre grown in an average year. The aggregate losses from insect pests to farm crops alone in the United States were estimated to amount in 1912 to a sum greater than the total cost of education in that country for the same year.

It has to be remembered that the very methods man has adopted in civilization favour the multiplication and spread of insect pests. The cultivation of large areas of country devoted to the production of a single crop provides unlimited means for the rapid multiplication of pests affecting that crop; at the same time the growth of railroad and maritime communications facilitates the spread of insects from one country into another. From among 73 of the worst insect pests of the United States, 37 have been introduced from foreign countries. Of these latter most of them have entered America unaccompanied by natural enemies that help to keep them in check in the lands whence they originally came. The European corn borer, cotton-boll weevil, San José scale, gypsy and brown-tail moths, alfalfa weevil, oriental peach moth and Japanese beetle, along with other pests, have all entered the United States from foreign lands, and have found conditions highly favourable to their multiplication and spread. Similarly the woolly aphis and greenhouse white-fly are believed to have entered the British Isles and other European countries from abroad, the grape-vine Phylloxea, a North American insect threatened in 1870 to destroy vine culture in Europe, and quite recently the Colorado potato beetle has become established in the Gironde area of France. Quarantine regulations, if strict, do much to preclude the entry of foreign pests into a country, but the innate difficulties attending the total exclusion of such immigrants are too great for legislative methods to be anything more than only partially effective.

Some of the more important insect pests are enumerated below, while further information is given in the separate articles devoted to the various orders to which these pests belong.

Insects Affecting Cultivated Crops.—Among the more important pests of cereals, frit fly (*Oscinella frit*) takes a serious toll of oats and to a lesser degree wheat, barley and rye over most of Europe, and the gout fly (*Chlorops taeniopus*) attacks barley. Wireworms or injurious larvae of click beetles (family *Elateridae*) attack the roots, not only of cereals but of many other crops also, and at times cause great damage. Among other pests, the Hessian fly (*Mayetiola destructor*) attacks wheat on both sides of the Atlantic, while the chinch bug (*Blissus leucopterus*) is exceedingly destructive to all kinds of cereals and grasses over eastern North America. Caterpillars of the type known as army worms and cut worms, together with locusts (*q.v.*) are important enemies of many crops in various parts of the world. The European corn borer (*Pyrausta nubilalis*) is an Old World pest of maize and other plants, but since 1917, when it was discovered near Boston (Mass.), it has become one of the worst of all immigrant insects found in the United States and Canada, where it now threatens the very existence of the maize crop and has largely resisted attempts to check its ravages and increasing spread.

Clovers and lucerne are subject to injury from various insects especially root-feeding larvae of weevils (*Sitona*); although lucerne is relatively free from serious pests in Europe, the alfalfa weevil (*Phytonomus posticus*) is a major pest in Utah, Colorado and adjacent States, having been imported from Europe. Vegetables suffer many pests and certain of these occur in both Europe and North America, notable examples being the onion fly (*Hylemyia antiqua*), the cabbage root fly (*Pegomyia brassicae*), carrot fly (*Psila rosae*), the asparagus beetle (*Crioceris asparagi*) and the cabbage white-butterflies (*Pieris*). In the United States curcubitaceous plants suffer heavily from the striped cucumber beetle (*Diabrotica vittata*) and the squash bug (*Anasa tristis*). In Great Britain and most parts of Europe the potato is singularly free from pests of the foliage, but in North America it is consistently attacked by the Colorado beetle (*Leptinotarsa decemlineata*). Beans, mangolds and sugar-beet are infested by the bean aphis (*Aphis rumicis*) over much of Europe, while flea beetles (*Phyllotreta spp.*) riddle the foliage and destroy seedling turnips, mangolds and other crops.

The cotton crop in many parts of the world has a formidable enemy in the pink boll-worm (*Pectinophora gossypiella*), while bugs of the genus *Dysdercus* known as cotton stainers also cause great damage, especially in the West Indies. The Mexican cotton-boll weevil (*Anthonomus grandis*) is one of the most severe of all insects affecting this crop, but is confined to Central America and the United States. In the latter country vast sums of money are annually spent in combating it. Sugar cane is especially attacked by moth borers, notably the widely spread species *Diatraea saccharalis*. Other moth borers include *Chilo simplex* in India, where it is a most important enemy of the crop, and the grey borer (*Laspeyresia schistaceana*) of Java. The borer weevil (*Rhabdocnemis obscura*) attacks not only sugar cane, but also banana and various palms all over the tropics, while in Trinidad, the frog-hopper (*Tomaspis saccharina*) causes immense damage and is exceedingly difficult to control. At one time the leaf-hopper (*Perkinsiella saccharicida*) threatened the existence of the sugar cane industry in the Hawaiian Islands until it became effectually suppressed by biological methods of control.

In North America tobacco suffers from the flea beetle (*Epitrix parvula*) and caterpillars of hawk moths among other pests. In Ceylon tea is affected by the shot-hole borer beetle (*Xyleborus fornicatus*), while in Assam the Capsid bug *Helopeltis theivora* is a major pest locally known as tea blight. Coffee has numerous pests including moth borers, beetle borers, leaf-miners and numerous scale insects.

The insect enemies of fruit and fruit trees would require several columns for their enumeration alone. Scale insects are of great importance in many lands. The San José scale (*Aspidiotus perniciosus*) in warm climates attacks all fruit and many other kinds of tree and multiplies with great rapidity. In North America it is a permanent enemy, extending all over the United States and into southern Canada. The fluted scale (*Icerya purchasi*) of Australia has spread throughout the world wherever citrus fruits are grown, but is effectively controlled by biological measures. Citrus fruits suffer from many other scale insects and from mealy bugs. In California several species of these pests are being repressed by biological measures, but spraying and fumigating under tents are resorted to on a large scale also. Among aphides the woolly aphis (*Eriosoma lanigera*) of the apple is prevalent in all parts of the world wherever that fruit is extensively cultivated, and mention must also be made of the Phylloxera of the vine (*q.v.*). Among beetle pests the plum curculio (*Conotrachelus nenuphar*) is well known in North America, where the recently introduced Japanese beetle (*Popillia japonica*) skeletonizes the leaves and destroys the fruit of many trees and shrubs; its larvae,

INSECT PESTS AFFECTING AMERICAN TREES AND CROPS

1. Mexican boll weevil (*Anthonomus grandis*) showing larva and pupa, the most destructive pest affecting the cotton crop in the U.S.A. 2. Oyster shell scale (*Mytilaspis pomorum*) or bark louse. The insect lives under the shell-like covering feeding on the sap of the tree. 3. Gipsy moth (*Porthetria dispar*), an enemy of fruit trees. This insect, of recent appearance in America, is being combated by government aid. 4. Japanese beetles (*Popillia japonica*) devouring a peach. These pests likewise consume the leaves of fruit trees, and the larvae are destructive below ground to roots of grasses. 5. San José scale (*Aspidiotus perniciosus*) on the bark of fruit tree. The insect feeds on the leaves and sap of many trees and shrubs. 6. European corn-borer (*Pyrausta nubilialis*) lodging in a weed. The moth lays its eggs on the leaf or stalk. Larva and pupa develop in the stem and bore toward the grain or ear of corn. 7. The corn-borer feeding in ears of maize. This insect threatens the most valuable crop of the United States, Indian corn. Measures to check its spread include destruction of stalks after harvesting and introduction of the European parasites of the borer

it may be added, are destructive below ground to lawns and golf-greens. In Europe the apple blossom weevil (*Anthonomus pomorum*) destroys the opening flower buds, and among moth pests, caterpillars of the winter moth (*Cheimatobia brumata*) and other Lepidoptera destroy the foliage of various fruit trees; in North America those known as canker worms and tent caterpillars are exceedingly destructive. Since 1916 the oriental peach moth (*Laspeyresia molesta*) has become an immigrant pest attacking plum, cherry, peach, quince and apple with great severity in the eastern United States. The stem borer leopard moth (*Zeuzera pyrina*) attacks both fruit and shade trees in several parts of the world, while the codling moth (*Cydia pomonella*) has spread throughout the world where the apple is cultivated and causes vast damage by its caterpillars, boring into the fruit. Among fly pests the Mediterranean fruit fly (*Ceratitis capitata*) and its allies attack an enormous variety of succulent fruits in most warm countries with the exception of California. Other pests include the pear fruit midge (*Contarinia pyrivora*) and the pear leaf midge (*Perrisia pyri*). Hymenopterous pests include various sawfly caterpillars attacking apple, pear, cherry, gooseberry and currants, and most species occur in both Europe and North America.

Insects Affecting Forest and Shade Trees.—In Europe the oak and other forest trees suffer defoliation by various caterpillars, notably those of the pea green moth (*Tortrix viridana*), nun moth (*Lymantria monacha*) and of numerous Geometers such as the pine moth (*Bupalis piniaria*), winter moth (*Cheimatobia brumata*), march moth (*Anisopteryx aescularia*) and mottled umber moth (*Hibernia defoliaria*). In America the gypsy moth (*Porthetria dispar*) and the brown-tail moth (*Euproctis chrysorrhoea*) have both been accidentally introduced from Europe and defoliate a great variety of trees. The first-mentioned species especially has entailed and is still entailing enormous expense in efforts to control its spread; already about £5,000,000 have been devoted to destroying these two pests by the legislatures of the eastern States, apart from very large allocations of Federal money for the same purpose. The European elm-leaf beetle (*Galerucella luteola*) is another serious defoliator, and in parts of the United States thousands of fine elms have been killed by this insect. Sawfly caterpillars of various species are very destructive defoliators of larch and other coniferas on both sides of the Atlantic, and these same trees also suffer heavily from shoot-destroying moth larvae, notably, the pine-shoot moth (*Evetria buoliana*) in Europe and restricted regions in the United States, and the spruce and balsam bud-worm (*Harmolegia fumiferana*), in the United States and Canada. Great injury to conifers is also caused by aphides of the genus *Chermes* and its allies. Perhaps the most severe of all forest pests are the bark and ambrosia beetles (*Scolytidae*), which attack conifers and to an extent some broad-leafed trees. The species *Dendroctonus ponderosae* is stated to have destroyed in 1919 more than a billion cubic feet of timber in the Black Hills forest reserve in the United States. Other species are almost equally destructive both in the United States and Canada and probably few coniferous forests in any part of the world are exempt from the depredations of these beetles.

The solid wood of all types of tree is infested with timber-boring larvae of Buprestid and Longicorn beetles, particularly in warm countries where these two families attain their maximum development. It is estimated that 1,200,000 cu.ft. of Sal timber is damaged annually in the Indian forests by the Longicorn, *Hopolcerambyx spinicornis*. In many parts of the world timber is injured by wood-wasps (*Siricidae*) and wood-boring moth larvae, notable examples of the latter belong to the family *Cossidae*, which includes the leopard moth, goat moth and the bee-hole borer of teak. Mention must also be made of the pine weevil (*Hylobius abietis*), which is exceedingly destructive to young conifers in Great Britain.

Insects Affecting Stored Products and Manufactured Goods.—Most of the insects which come under this category are cosmopolitan pests that are readily transferred from one country to another through commerce. Among the many pests of stored grain, flour and meal, the granary weevils (*Calandra granaria* and *oryzae*) are among the best known, while the mealworms (*Tenebrio*) and the saw-toothed grain beetle (*Silvanus surinamensis*) also occur with great frequency. Among moths, the caterpillars of the Mediterranean flour moth (*Ephestia kuehniella*) and the Indian meal moth (*Plodia interpunctella*) render flour and meal unfit for consumption, while the caterpillars of the Angoumois grain moth (*Sitotroga cerealella*) attack grain in the field as well as in storage.

Among pests which attack clothing and carpets, the clothes moths (*Tinea pellionella* and *Tineola biselliella*) are well known and their larvae also attack wool, hair, feathers and dried skins. Beetles of the genera *Anobium* and *Xestobium* bore into furniture and the rafters of old buildings, and the larder beetle (*Dermestes lardarius*) and its allies infest skins, wool, meat, ham and cheese. Stored and manufactured tobacco is attacked by the cigarette beetle (*Lasioderma serricorne*) and dried museum specimens of natural objects by the beetle *Anthrenus scrophulariae*, which also attacks carpets and other materials. Drugs such as aconite and opium, together with biscuits, chocolate, pepper, ginger and many other substances, are infested by *Sitodrepa paniceum*, which is often known as the drugstore beetle.

Insects Affecting Domestic Animals.—Among the most important of these are the ox warble flies (*Hypoderma*), which are prevalent throughout Europe, North America and other parts of the world. They occasion great losses to cattle raisers by the presence of the grubs beneath the skin which cause irritation and deterioration of the flesh, reduction of milk and perforation of the hides; anaphylactic shock may also result when the grubs under the skin are crushed, and illness or even death of the host may supervene. The sheep *bot-fly* (*Oestrus ovis*) is of worldwide distribution and its larvae infest the sinuses of the head; sheep also suffer from the ked or "tick" (*Melophagus ovinus*) which causes irritation and loss of flesh, and is especially harmful to lambs. The sheep-maggot flies of Australia cause immense losses through their larvae infesting the wool and skin and causing septic wounds. Horses and mules are very prone to attack from bot flies of the genus *Gastrophilus* and their larvae infest the throat, stomach and intestines, attaching themselves to the lining walls of the parts concerned. In Russia the flesh fly (*Sarcophaga magnifica* [*Wolfarti*]) causes great suffering to domestic animals, owing to even the smallest wound becoming infested with its larvae. The screw-worm fly (*Chrysomyia macellaria*) is a very similar type of pest in the south-west United States and its larvae often cause fatal injuries. Lice or Siphunculata are irritating blood-sucking ectoparasites which cause wasting of the flesh when very numerous: horses, cattle and swine are all liable to infestation. Biting lice or Mallophaga are particularly irritating pests of poultry and some species also infest domestic animals; lastly, fleas of various kinds occur on domestic animals and birds.

Insects Affecting Man.—Many kinds of flies and certain other insects harm or molest man himself in various ways: some of these are merely irritating or annoying, while others act as agents, conveying the pathogenic organisms of some of the most virulent diseases from one person to another. For a discussion of this subject the reader is referred to MEDICAL ENTOMOLOGY and PARASITOLOGY.

Insect Vectors of Plant Diseases.—During recent years it has become increasingly evident that certain insects disseminate diseases among plants. Several bacterial diseases, such as fire blight of apples and pears and wilt diseases in other plants, are known to be spread from plant to plant by insects. The recently recognized group of virus diseases known under the names of mosaic, leaf curl and leaf roll, have been shown in some cases to be conveyed from diseased to healthy plants by the punctures of sap-sucking Hemiptera. Thus, curly top in beet is transmitted by the leaf hopper, *Eutettix tenella*, sugar-cane mosaic by the aphid, *Aphis maidis*, and aster yellows disease by the leaf-hopper, *Cicadula sexnotata*. Recent research points to the growing importance of virus diseases, and their transmission by insects, in plant pathology.

BENEFICIAL INSECTS

It is only too often overlooked that man derives vast direct and indirect benefits from insects. Practically every species is preyed upon and kept within bounds by the attacks of other insects, either

parasites or predators, while bacterial and protozoal diseases, birds and insectivorous mammals, also contribute to the destruction of a large bulk of insect life. But for these natural controls man would stand little chance of successfully competing with insects in maintaining his food supply. Among predators, ground beetles and ladybirds along with their larvae, together with larvae of lacewings and many flies, are of great importance, but the palm of efficiency must be allotted to the parasitic forms such as Tachinid flies, and almost all members of the great groups of parasitic Hymenoptera, which probably account for the destruction of a greater proportion of insect life than we have adequate means of appreciating. The importance of these predators and parasites is becoming increasingly recognized by economic entomologists, and is further discussed in the succeeding section on control measures.

There is also to be recollected the fact that insects are the most important of all agents concerned with the pollination of flowers. In the case of fig-growing the flowers of the cultivated fig need to be pollinated from the wild or caprifig. The structure of the fig flower is such that pollination requires to be carried out by the intervention of a small Chalcid *Blastophaga*. In California and elsewhere profitable fig-growing did not become possible till this insect was introduced and established so that it could carry out its useful work. One need scarcely mention the enormous benefits man has derived from the use of honey, beeswax and silk. Lac, which is still an important commercial product, and has not been supplanted by any artificial substitute, is yielded by the Indian scale insect (*Tachardia lacca*). Cochineal is yielded by another Coccid, *Dactylopius coccus,* indigenous to Mexico, but now established in other lands, and the drug cantharidin is obtained from blister beetles (family *Cantharidae*). Again, several kinds of insect are used as ornaments, such as the ground pearls of the West Indies and the Buprestid beetles of the Orient and South America, while many showy butterflies and beetles are used for various decorative purposes. Finally, a number of insects are, or have been, used by uncivilized man as food. Apart from manna of biblical times—which is almost certainly a kind of honey dew—grasshoppers, caterpillars, water-boatmen and termites are used as food by various races. Many aquatic insects are important items in the diet of fresh-water fishes, and other insects are used by anglers as bait.

Another possible benefit to be derived from insects is their utilization in checking the spread of noxious weeds resisting all other measures of restraint. Success in this field has been achieved in the Hawaiian Islands, in checking the spread of *Lantana* by introducing into that territory insects which prey upon that plant in its natural home in Mexico. Strenuous and encouraging efforts are being made to control prickly pear in Australia by similar means, and experiments are being carried out with a view to attempting the control of blackberry, gorse and other noxious weeds in New Zealand by insects imported from other parts of the world. Work of this character has its drawbacks and every care has to be exercised lest the introduced species may turn their attention to economic plants and so become pests rather than benefits to the countries concerned.

CONTROL MEASURES

Methods of controlling noxious insects are very diverse and are discussed under four headings below.

Cultural Methods.—Cultural methods as a rule involve some change in the normal course of agricultural operations and frequently they have the advantage of being preventive rather than remedial in effect. Such methods aim at enabling the crop to escape the severity of attack by a specific pest by altering the time of sowing, by special type of cultivation or manuring, by changing the rotation so that the susceptible crop occupies a different place in the rotation scheme, or by the use of a less susceptible variety of the crop concerned. It is also to be remembered that many pests are concealed feeders and are, therefore, safe from the effects of insecticidal treatment, or the crop may be of such a character as to render such treatment impossible. As examples of cultural measures the following are noteworthy. The only satisfactory means of coping with the frit fly consists in sowing sufficiently early, so that by the time the insect appears the crop has reached a stage when it is not liable to attack. Attacks of wheat bulb fly (*Hylemyia coarctata*) may be avoided by never allowing that crop to follow a summer fallow or early potatoes, since the eggs are laid in the bare soil or on ground sparsely covered by a growing crop. Again, American vines are largely resistant to the gallicolae generations of the Phylloxera, certain varieties of cotton are resistant to attacks by leaf-hoppers, and apples grown on North Spy stocks are not liable to attack by woolly aphis. Manuring with nitrogenous fertilizers has been shown to facilitate the recovery of tea from attacks of the shot-hole beetle borer in Ceylon, and phosphatic manures appear to hasten the maturing of the ears of barley to a condition which is less liable to attack by gout fly. In Trinidad the control of the sugar-cane frog-hopper is no longer an entomological problem, but is one of cultivation. Under conditions where the water content of the soil is disturbed, it is probable that the constitution of the sap of the plants is altered and that water shortage is a possible cause of increased susceptibility to frog-hopper damage.

Physico-chemical Methods.—Most measures which come under this category are remedial rather than preventive and the most important involve the application of chemical substances termed insecticides. Insecticides may be divided into stomach poisons, contact poisons, fumigants and winter washes. Many of them may be applied either in the form of wet sprays or as dusts.

Stomach poisons are effective against biting insects which devour foliage, and their object is to coat the plants with a toxic substance which the insects will devour, along with their food. In the application of sprays the essential basis, therefore, is the toxic compound, but other material (soap, etc.) has to be added in order to facilitate the mixing of such a compound with water and to ensure its spreading over and effectively wetting the foliage. Among the best-known stomach poisons are arsenicals, especially Paris green, lead arsenate and calcium arsenate.

Contact poisons are used against sucking insects which derive their nutriment from the sap. It is evident that coating the plant with an external poison will have little effect against pests of this character and consequently contact insecticides, which kill by being applied to the outsides of the insects themselves, become necessary. The most valuable of all contact insecticides is nicotine, which is largely used in the form of nicotine sulphate at the rate of one gallon of the compound (containing 40% nicotine) to about 800 to 1,000gal. of water. Among other contact insecticides pyrethrum, derris, quassia, oil-emulsions, soaps and lime-sulphur are used for various pests.

Fumigants are effective in glasshouses, warehouses and also for treating living trees in the field, in which case the plants are covered with special hoods or tents for the purpose. Hydrocyanic acid gas is one of the best-known fumigants for glasshouse work throughout the world; carbon disulphide is put to various uses and is also applied against root pests in the soil. Among other fumigants, nicotine, carbon tetrachloride, chlorpicrin and paradichlor-benzene may be mentioned.

FIG. 1.—KNAPSACK SPRAYER, SUITABLE FOR LIQUID INSECTICIDES AND IN GENERAL USE FOR SPRAYING POTATO CROPS AGAINST BLIGHT

Winter washes are applied during the dormant season and are designed to kill the eggs and other over-wintering stages of insects present upon the trunks and branches of fruit trees. Such washes include caustic alkalis, lime-sulphur, miscible oils and tar distillate compounds.

The usual method of applying insecticides is in the form of sprays, and on a small scale, knap-sack sprayers (fig. 1) which can be carried on the back of the operator, are widely in vogue. On a field scale horse-drawn or mechanically driven machines are necessary (fig. 2) and many patterns are on the market. The nozzles aim at producing the spray in a fine mist and can be fitted

to any length of tubing so as to reach to the tops of high trees if necessary. Pumps keep the insecticide constantly mixed, and at the same time discharge it forcibly through the nozzles wherever it is required. In America the use of insecticides in the form of dusts has come greatly into use during recent years. The toxic compound is used in powdered form, diluted and mixed with a suitable carrier such as kaolin, hydrated lime or ground dolomite.

FIG. 2.—STEAM SPRAYING PUMP IN KENTISH HOP FIELDS
The pump is a simple, reliable apparatus suited to unskilled hands. It is of the single cylinder direct-acting type, can supply wash for eight jets to spray simultaneously, and weighs 12 cwt.

The dusting can either be done by hand machines or horse-drawn apparatus. In the latter case the dust is expelled by the air blast created by a fan which is geared to the wheels of the machine. At the present time dusting materials are usually more expensive than those required for spraying, but the labour and time consumed are less and the equipment lighter and more easily used on bad ground. Also, the water difficulty—400 to 500gal. being required to spray an acre of fruit trees—is done away with. Dusting, however, can usually only be carried out when the foliage is wet with dew to give adhesion to the particles and is precluded by high winds. During the last seven years the use of the aeroplane has come very much to the front in the United States, particularly for dusting cotton with calcium arsenate against the boll weevil. Many acres of fruit have also been treated by this method, and by applying Paris green, large areas of standing water have been dusted to kill mosquito larvae. The evolution of types of aeroplanes capable of manoeuvring under the special conditions required, has led to rapid advances in this method of control. Before many years elapse it is likely to be widely used in the control of forest pests and locust invasions, and tests have already been carried out in Germany, Russia and other countries. In Great Britain the uses of the aeroplane are very limited, but in the cases of potatoes and fruit where considerable areas are under cultivation, the method has its possibilities. Among the advantages of the aeroplane is speed, it being possible to dust 600 to 1,000ac. in one hour and one plane is capable of doing the work of 50 to 75 cart dusting machines in the same time.

Among other physico-chemical methods the use of heat for killing pests in mills and warehouses is coming to the fore, while in some cases light traps are effective in the quantitative destruction of such pests as the paddy borer. As a rule, however, the expense and trouble of maintaining light traps are not commensurate with the results obtained. The use of attractive volatile reagents has great possibilities as lures, very much on the same principle of the moth collector's sugar mixture. Fermented molasses is used as a bait for the destruction of vine moths in France and geraniol has recently been shown to be powerfully attractive to the Japanese beetle in the United States.

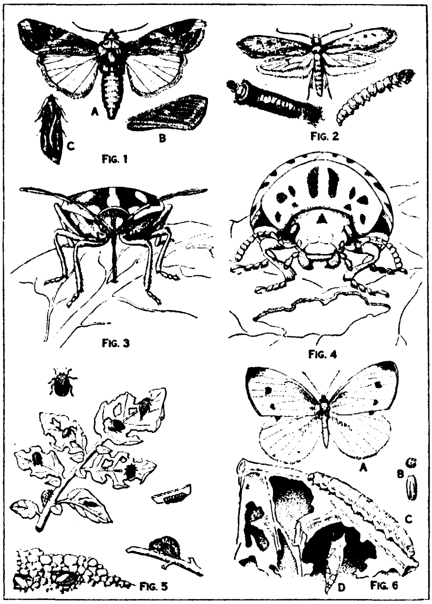
Biological Methods.—Biological or natural methods of control involve the use of parasites, predators, or disease organisms for the purpose of ensuring a high rate of mortality to the particular pest concerned. This type of control has been successful in cases where a noxious insect has been introduced into a country unaccompanied by those natural enemies which restrain it in the land whence it came. The first example of this kind was achieved in 1889, when the Australian ladybird (*Novius cardinalis*) was introduced into California for the purpose of destroying the cushiony scale (*Icerya purchasi*) of citrus fruits. The experiment proved so successful that this method of control has been applied in almost all countries where that pest has been prevalent, with equally satisfactory results. In the Hawaiian Islands almost all the pests of sugar cane have been so effectually controlled by biological means that they are no longer a menace. Special mention needs to be made of the control of the cane leaf-hopper by Chalcid wasps and a Capsid bug (*Cyrtorhinus mundulus*) introduced from Queensland and Fiji. The cane-borer beetle has also been largely kept under control by a Tachinid fly obtained in New Guinea, and the *Anomala* beetle by a Scoliid wasp from the Philippines. Great benefit has been derived from the introduction of a tiny Chalcid (*Aphelinus mali*) from the United States into New Zealand, where it is effectually destroying the woolly aphis of apple. In Fiji the coco-nut moth gives every promise of being controlled by a Tachinid fly which is prevalent in Malaysia. There are again other cases where results have not been so readily obtained, and efforts have been going on for many years to secure some measure of control over the gypsy and brown-tail moths by the importation of a whole range of parasites that attack these insects in their various stages. In the same way likely parts of the world are being searched for parasites of the European corn-borer, the Japanese beetle and other introduced pests of the United States.

Legislative Control.—Legislative control may be broadly divided into two classes—external measures and internal measures. External measures are framed to exclude the entry of foreign pests into a country through commerce, and they form the subject of legislation in most civilized nations. Internal measures take the form of special acts designed for enforcing the adoption of adequate methods of treatment by growers, and are aimed at destroying or restraining the spread of noxious insects within a particular country. The assistance of legislation enables the official entomologist to secure the compulsory application of important measures for the benefit of the community.

GROWTH AND DEVELOPMENT OF ECONOMIC ENTOMOLOGY

Great Britain.—In most civilized countries there now exist services under Government auspices for dealing with insect and other pests of cultivated plants and crops. For many years economic entomology was not officially recognized in Great Britain and the subject was left to the good will of two public-spirited private individuals; viz., John Curtis and Eleanor A. Ormerod. John Curtis's work was coincident with the founding of the Royal Agricultural Society in 1840, and on behalf of that body he prepared a series of reports upon insects affecting various crops for the years 1841 to 1857. Previously he had contributed essays on injurious insects to the columns of the *Gardener's Chronicle* of Lindley, and the experience thus gained from both these activities enabled him to publish his standard book on farm insects in 1860. Eleanor Ormerod carried forward and greatly extended the work of Curtis, and may be rightly regarded as the patron saint of British economic entomology. From 1876 to 1893, in her capacity of honorary consulting entomologist to the Royal Agricultural Society, she accomplished an enormous amount of valuable advisory work. During that period she published at her own expense, 17 well illustrated reports on injurious insects, which did much towards educating the farmers of the country in the matter of crop pests. She also published a *Manual of Injurious Insects* and numerous smaller works. Her efforts made the work of Curtis and the early American entomologists accessible to the agricultural community and she may be truly said to have been the pioneer who laid the basis for future progress in Great Britain. In 1889 the Board of Agriculture was formed and Sir Charles Whitehead was its technical adviser on crop pests and other problems. He issued a number of reports and bulletins up to the year 1894. For some years following the board had no

whole-time technical adviser on entomological matters and sought any assistance needed, mainly from outside quarters. In 1907 the Destructive Insects act of 1877 (which previously only applied to the Colorado beetle) was enlarged so as to enable the board to deal with all pests which may attack crops, trees and bushes. In consequence of passing this act the board created a special staff of inspectors set apart for dealing with plant pests,



1. Fall army worm; A. moth; B. forewing; C. pupae; 2. Clothes moth; 3. Harlequin cabbage bug; 4. Colorado potato bug; 5. Life history of Colorado potato bug; 6. Common cabbage worm; A. female butterfly; B. egg as seen from above and side; C. larva in natural position on cabbage leaf. D. suspended chrysalis

and also an official entomologist with office accommodation in London. In 1909 the passing of the Development Fund act marked a great advance with respect to all problems relating to insects and other pests of cultivated plants. It provided much needed financial resources for a definite scheme for research and advisory work. The development scheme progressed in several stages, and finally led to the establishment of a phytopathological service of England and Wales. The latter is now divided into two sections, one official and the other non-official. The official section is directly controlled by the Ministry of Agriculture (formerly the Board of Agriculture) and is divided into the plant-pathology laboratory at Harpenden, Herts, an administrative unit in London, and an inspectorial staff of about 30 members. The pathological laboratory is under a director who is, at present, also the official Government entomologist, and there is a small staff of entomologists and mycologists. The non-official section is distributed through various universities, colleges and institutes in the country, and consists of research and advisory divisions. Financial provision comes from Government funds, but the actual duties are largely carried out without State supervision. The research division is located among five centres, the most important being the phytopathological research institute attached to the Rothamsted Experimental Station. In addition to workers in mycological subjects, this institute has a permanent staff of four entomologists and is a main centre for entomological investigation in Great Britain. Entomologists are also on the staffs of the Long Ashton Fruit Station, Bristol, the fruit station at East Malling and the Lea Valley station for glasshouse crops at Cheshunt. The advisory division is located in 14 centres or provinces, each centre being established at a university or agricultural college. The advisory staff consists of an entomologist and other specialists in each province, who diagnose troubles on behalf of farmers and carry out experiments in the practical control of pests within the local area concerned.

The Imperial Bureau of Entomology.—A second important development in British economic entomology took place with the founding of the Imperial Bureau of Entomology in 1913. This bureau, whose offices are in London, is supported financially by contributions from the Imperial Government and the Governments of the dominions, colonies and other dependencies of the empire. It issues a monthly review of all current literature bearing on economic entomology in various countries, and a bulletin for the publication of original researches. It also gives advice to entomologists throughout the empire, identifies insects and advises the Colonial Office on appointments and other entomological matters. Under a grant from the Empire Marketing Board it also maintains a parasite laboratory at Farnham Royal, Bucks.

United States.—In the United States economic entomology has advanced to a higher degree of efficiency than in any other country. Most of the important advances in remedial measures have been made in America, where also some of the most exact and thorough life-history studies of insect pests have been traced out. Economic entomology in America may be said to start with T. W. Harris, of Massachusetts, who was probably the first entomologist in that country to receive public compensation for his labours. His now classic report on insects injurious to vegetation appeared in 1841, and was elaborated in 1862 as a treatise in book form; this work is still much consulted by the practical entomologists of the north-eastern section of the country. The first scientific man officially commissioned to investigate insect pests was Asa Fitch, who held the courtesy title of State entomologist of New York from 1854 to 1872. His 14 annual reports on the injurious insects of New York comprise a mass of useful information respecting their life-histories. Almost simultaneously with Fitch's appointment came the establishment of an entomologist under the general Government of the United States. In 1854 T. Glover was selected for this post and he was succeeded by C. V. Riley in 1878. Owing to a misunderstanding Riley resigned the following year and J. H. Comstock succeeded him as Federal entomologist. Comstock, during the two years of his office, published exceedingly valuable works dealing with cotton, orange and scale insects, which are masterpieces of thoroughness and practicability. In 1881 C. V. Riley resumed charge, and from this time till 1894 he remained continuously in office. He accomplished work of the highest order and has been largely instrumental in placing economic entomology upon its present sound footing in the United States. He developed not only the scientific aspects of the subject and published a vast amount of detailed life-history studies, but under his direction advances were made in insecticides and spraying methods of far-reaching application. Riley's work at the Federal division of entomology, and his earlier labours in the employ of the State of Missouri (to be mentioned hereafter), place him among the outstanding economic entomologists of the world. He was succeeded in 1894 by L. O. Howard, who remained in office till 1927, when C. L. Marlatt assumed charge. Under Howard's lengthy and sagacious administration, economic entomology in the Federal Department of Agriculture has been carried forward into a position of efficiency and commanding importance unequalled in any other country. At the present day it forms one of the largest bureaus of the department and has a fiscal grant from Congress which amounted in 1925–26 to $2,500,000 and a staff of over 400 trained entomologists. The chief of the bureau is located in Washington, together with the offices of the heads of the various divisions into which it is organized. The staff are stationed all over the country wherever problems need urgent attention, and in the case of

major investigations the work is centred in special laboratories established in areas best adapted to the enquiries in question. Among the most notable of these special laboratories are the cotton-boll weevil laboratory at Tallulah (La.); the gypsy moth laboratory at Melrose Highlands (Mass.); the Japanese beetle laboratory at Riverton (N.J.); the corn borer laboratory at Arlington (Mass.); the bee culture laboratory at Somerset (Md.), and the European parasite laboratory at Hyères, France.

Outside the activities of the Federal Government the legislatures of the various States have their own entomological organizations. Up to 1888 only four States supported official economic entomologists: Massachusetts (A. S. Packard Jr.), New York (Asa Fitch), Illinois (W. Le Baron) and Missouri (C. V. Riley). It was in the capacity of State entomologist for Missouri that C. V. Riley issued his nine reports, which first established his reputation; they are characterized by their original, scientific and practical character, and the very wide range of insect pests which they cover. These reports and the excellence of their original illustrations have made their author's name familiar to economic entomologists outside the United States. In 1888 the organization of the agricultural experiment stations under the Hatch Act was of great importance to economic entomology in America, and at the present day there are one or more experiment stations in every State of the Union. These stations, often in conjunction with State agricultural colleges, maintain among them a staff of more than 200 entomologists, and disseminate a vast amount of practical information through the medium of reports and bulletins.

Mention must also be made of the United States entomological commission, founded under special act of Congress in 1877, which gave a great impetus to original investigation. Although primarily intended to study the Rocky Mountain locust depredations, the commission also carried out important work on other major pests as well as publishing a standard treatise on insects affecting forest and shade trees. Outside official circles the most important organization is the American Association of Economic Entomologists, which was founded in 1889 and had, in 1927, 849 practical entomologists on its membership roll.

Canada.—The first Government entomologist in Canada was James Fletcher, of the Dominion experimental farms, Ottawa, who was appointed in 1884, and his reports and other contributions laid the basis for future work in that country. Fletcher's activities were furthered in every way by W. Saunders, the then director of the experimental farms, who was also an economic entomologist of high reputation. In 1908 Fletcher was succeeded by C. G. Hewitt, through whose energies entomology was raised to the status of a separate branch of the Canadian Department of Agriculture, with greatly enhanced scope and activities, and its own offices and laboratories in Ottawa. At the present day the branch is directed by the dominion entomologist assisted by an associate dominion entomologist and two divisional chiefs; there are also entomologists in charge of 14 branch laboratories distributed throughout the country. Outside official work, economic entomology in Canada is mainly centred in the Entomological Society of Ontario, whose annual reports, which are subsidized by the State, are of recognized practical and educational value.

Other Parts of the British Empire.—The agriculture departments of most of the dominions, colonies and other dependencies of the empire have on their staffs one or more men qualified to help the agricultural community to battle against insect pests. The largest entomological organization is that of the Union of South Africa, which maintains a staff of about 20 entomologists. A certain number of these are engaged in teaching the subject in colleges and schools of agriculture, but the majority are employed by the division of entomology under the Union Department of Agriculture. The division is directed by a chief and the staff are engaged in the study and control of cotton insects, locusts, tsetse fly, tobacco insects and other problems. In Australia the important post of Commonwealth entomologist has recently been established and there are one or more official entomologists attached to the agricultural departments of the provinces. In India there is an Imperial entomologist at the Pusa research institute and also entomologists in the agricultural departments of the different provinces. A number of entomologists are officially employed under the Wellcombe tropical research laboratories and the Gezira research farm in the Sudan.

Finally, it should be mentioned that good work in economic entomology is being done in most European countries and in Japan.

BIBLIOGRAPHY.—General works: For a general treatise on the insect pests of the world consult volume iv. by L. Reh in Sorauer's *Handbuch der Pflanzenkrankheiten* (1925). The *Manual of Dangerous Insects* (U.S. Dept. of Agricul., 1918) is a useful annotated list of extra-American species. Many of the leading text-books are American, and E. D. Sanderson and L. M. Peairs, *Insect Pests of Farm, Garden and Orchard* (1921); H. G. Fernald, *Applied Entomology* (1921); G. W. Herrick, *Manual of Injurious Insects* (1925) and *Household Insects* (1914); M. V. Slingerland and R. C. Crosby, *Manual of Fruit Insects* (1914); E. P. Felt, *Manual of Tree and Shrub Insects* (1924); and E. O. Essig, *Insects of Western North America* (1926) are among the best books. English readers will find J. Curtis, *Farm Insects* (1860); F. V. Theobald, *Agricultural Zoology* (1910) and *Insect Pests of Fruit* (Wye, 1909) contain accounts of most of the pests of Great Britain. Forest insects: A. T. Gillanders, *Forest Entomology* (1912); A. Barbey, *Traité d'Entomologie Forestière* (1925); O. Nusslin, *Forstinsektenkunde* (1927); K. Escherich, *Forstinsekten Mitteleuropas* (2 vols., 1914–1923).

Insects affecting domestic animals: M. Neveu-Lemaire, *Parasitologie des Animaux Domestiques* (1912); E. Seguy, *Les Insectes Parasites* (1924) and various other works on Parasitology. Control methods: R. A. Wardle and P. Buckle, *Principles of Insect Control* (Manchester, 1923); E. Bourcart, *Insecticides, Fungicides and Weedkillers* (1926); O. G. Anderson and F. C. Roth, *Insecticides, Fungicides and Appliances* (1923). For aeroplane dusting *see* B. R. Coad, E. Johnson and C. L. McNeil, *Bull. 1204, U.S. Dept. of Agric.* (1924) and A. D. Imms, *Journ. Ministry Agric.* (vol. xxiii., 1926). Development of Economic Entomology: consult the following special articles: L. O. Howard "Rise and Present Condition of Official Economic Entomology" (*Insect Life*, vol. vii.); "Progress in Economic Entomology in the United States" (*Yearbook, United States Dept. Agric.*, 1899); C. G. Hewitt, "A Review of Applied Entomology in the British Empire" (*Annals Entom. Soc. Amer.* vol. ix., 1916); J. C. F. Fryer and G. H. Pethybridge, "The Phytopathological Service of England and Wales" (*Journ. Ministry of Agric.*, vol. xxxi., 1924); P. Marchal, "Les Sciences biologiques appliquées de l'Agriculture aux États-Unis" (*Ann. Service des Epiphyties*, vol. iii., 1916. Periodical literature: Periodical literature on economic entomology has assumed enormous proportions and is published not only in special journals devoted to the subject, but is also scattered through numerous other serial publications. *The Review of Applied Entomology* abstracts all papers published on insects affecting agriculture, and the chief journals devoted to original papers in economic entomology include the *Bulletin of Entomological Research* (London), *Journal of Economic Entomology* (Geneva, N.Y.), *Zeitschrift für angewandte Entomologie, Redia* (Florence and *Bolletino del Laboratorio di Zoologia Agraria* (Portici). *The Annals of Applied Biology, Annales du Service Epiphyties*, and the *Journal of Agricultural Research* also publish numerous papers on injurious insects and control methods. Other periodical literature includes the almost innumerable annual reports and bulletins published by agricultural departments of almost every civilized country of the world. Among them, those of the various State experimental stations and of the Department of Agriculture of the United States, the Entomological Society of Ontario, and the agricultural departments of India, South Africa, Egypt, etc., may be specially mentioned. (A. D. I.)

MEDICAL ENTOMOLOGY

Although medical entomology includes in its scope venomous and parasitic arthropoda that inflict minor hurts upon the individual human body, its main concern is with arthropoda which, either as the necessary intermediary hosts or as the fortuitous mechanical disseminators of other pathogenetic organisms, stand in the main line of causation of serious endemic and epidemic disease.

Manson's Discovery.—Such insect-borne disease, though from of old a topic of popular belief and even of rational speculation, was first clearly demonstrated by Manson, who discovered, in 1879, how the embryos of the worm that causes a common filarial disease of the tropics are extracted from one human host by a female mosquito and then pass through their larval development within that insect's body before they can find their way into another human host. The value of this discovery, however, was not generally appreciated until 1898, when Ross discovered how the parasites of malaria, after an analogous dependence on the mosquito for transport and sustenance, are injected into their human host by the insect intermediary, it being, however, "Man-

son's theory, and no other, which actually solved the problem" of the mode of transmission of this disease.

In these and similar instances the insect is a go-between, safeguarding the transfer of a specifically "human" parasite from one human being to another. But many blood-sucking insects are normally infected with seemingly innocuous endoparasites of their own, and some maintain that such insects may inject their own parasites into the human body where they may not remain innocuous; and it is to be noted that surmise of the same still unsatisfied kind has been awakened by the recent discovery in the normal intestine of certain insects, particularly bugs and lice, of bodies similar to the minute Rickettsia-bodies isolated, in 1916, by Rocha Lima from typhus fever cases and regarded by him as specifically morbific.

Recent developments in medical entomology may be summarized thus:

Diseases Specifically Attributable to Mosquito Agency.—To filariasis, malaria and yellow fever, the parasite of which last was in 1918 determined by Noguchi as a *Leptospira*, must be added dengue fever, shown to be transmitted in Australia (Cleland and others) by *Stegomyia fasciata*, and in Syria (Graham) by *Culex fatigans*.

Diseases Specifically Attributable to Sandfly Agency.—In entomological company with phlebotomus fever will probably have to be placed oriental sore (Sergent brothers: Aragão), and also kala-azar, the natural history of which seems to be definitely associated with *Phlebotomus argentipes* (*see* KALA-AZAR and SANDFLY FEVER).

Diseases Attributable to Gad-fly (Tabanidae).—The details of the post-embryonic development of *Filaria* (*Loa*) *loa* in the course of its transmission from man to man by *Chrysops dimidiata* and *salacea* were described in 1921 by Dr. and Mrs. Connal. (Tularaemia, a recently recognized septic fever of American rabbits, may be imparted from rabbits to man by *Chrysops discalis*, but merely mechanically, since the infection may also pass to man without any insect intervention.)

Diseases Specifically Attributable to Tsetse-fly Agency.—Besides the notorious *Glossina palpalis* and *morsitans* several other common species of *Glossina* are now known to be intermediary in the spread of the trypanosomes of African sleeping sickness.

Diseases Specifically Attributable to Flea Agency.—Hirst, in Ceylon, and Cragg, in India, have produced good evidence that not all the three species of rat-fleas of the *Xenopsylla* genus are equally formidable in spreading bubonic plague, and that plague does not rage as an epidemic in places where *Xenopsylla astia* is the only flea infesting the local rats. The evidence of the intermediation of the dog-flea in the transmission of infantile kala-azar is still obscure.

Diseases Attributable to Bugs (Rhynchota).—The parasite of South American trypanosomiasis (Chagas's disease) is now known to be transmissible by several species of reduviid bugs—and also, experimentally, by other blood-sucking insects—and is believed to be imparted to man in the insects' excrement. An original natural source of infection is said to exist in armadillos and opossums.

Diseases Attributable to Lice.—In company with typhus and relapsing fever the war disease "trench-fever" is to be included. In all three instances the virus is inoculated by contamination. The lousy person as he scratches himself rubs the infective juice or excrement of the infected insects into the abrasions of his skin. Another and unpleasant complaint thus engendered is Pediculosis.

Diseases Attributable to Ticks.—Several species of *Ornithodorus* are now suspected of transmitting the spirillum of relapsing fever, and *O. talaje* in tropical America has been shown to be as dangerous in this respect as the African *O. moubata*. The virus of Rocky Mountain spotted fever, conveyed to man by *Dermatocentor venustus*, is declared by Wolbach to be a *Rickettsia*. Another tick of this genus, *D. andersoni*, has been found infected with the bacillus of tularaemia. In these tick-borne infections the parent tick, becoming infected, transmits the infection to its offspring.

Diseases Specifically Attributable to the Agency of Harvest Mites (Trombidiid larvae).—Besides Japanese river fever, the virus of which is inoculated by the *akamushi* mite, there are other local and seasonal epidemic fevers that have a similar causation. Among them is the pseudotyphus of Sumatra.

Diseases Specifically Attributable to Crustacean Agency.—Small freshwater copepods of the genus *Cyclops* have been known from the time of Fedshenko to be intermediary hosts of the guinea-worm (*Dracunculus medinensis*); and in 1917 Janicki and Rosen discovered, in *Cyclops strenuus* and the near-related *Diaptomus gracilis*, the long-sought first intermediary hosts of the larval ribbon worm (*Bothriocephalus latus*). Japanese workers have shown that species of river crabs play an intermediary part in the post-embryonic development of the lung-fluke.

Diseases Attributable to Fortuitous Insect Agency.—We must consider also the odious assistance lent by domestic insects—houseflies, cockroaches, cellar-beetles, ants, fish-insects and by the ubiquitous fauna—moth and beetle-larvae, booklice, food-mites—of granaries, provision stores, warehouses etc., in the indiscriminate and mainly mechanical dissemination of morbific material of various kinds. Houseflies are the most assuredly dangerous of these disturbers of the public health. Fibiger found that in rats infected with a filarial worm of the genus *Gongylonema*, through feeding on infected cockroaches, cancerous growths started from the lesions caused in the rat by the worm.

Although the insects here very briefly reviewed are dangerous to public health, it is beginning to be realised that the peril is conditional. In an environment unmodified by sanitation, such as prevails in extensive areas in the tropics, these insects are a constant danger and, at the present time, must be attacked with energy and with resource based upon a study of their life-history, seasons and habits. But in countries having settled standards of personal and domestic hygiene and an efficient sanitary administration these insects have ceased to be a standing menace to the public health, as is exemplified by the history of plague, typhus and malaria in England since the establishment of a sanitary régime.

See A. Alcock, *Entomology for Medical Officers* (1920).

(A. W. A.)

ENTOMOSTRACA, a term now obsolete but formerly used in zoology to denote collectively all the Crustacea (*q.v.*) except the Malacostraca (*q.v.*). The word is misleading, as the groups thus brigaded together have no special relationship to one another.

ENTR'ACTE, the interval between the acts of a dramatic performance, or between the different items of a miscellaneous entertainment; *entr'acte* music being that intended to be played during this period. "Act-tune" was an earlier term, now quite obsolete.

ENTRAGUES, CATHERINE HENRIETTE DE BALZAC D' (1579–1633), marquise de Verneuil, mistress of Henry IV., king of France, was the daughter of Charles Balzac d'Entragues and of Marie Touchet, mistress of Charles IX. She induced Henry IV. to promise to marry her after the death of Gabrielle d'Estrées, a promise which led to bitter scenes at court when shortly afterwards Henry married Marie de Medici. She was deeply compromised in the conspiracy of Marshal Biron against the king in 1606; and in 1608 Henry actually took her back into favour. She seems then to have been involved in the Spanish intrigues which preceded the death of the king in 1610.

See H. de la Ferrière, *Henri IV. le roi, l'amoureux* (1890).

ENTRECASTEAUX, JOSEPH-ANTOINE BRUNI D' (1739–1793), French navigator, was born at Aix, and entered the navy at the age of fifteen. In the war of 1778 he commanded a 32-gun frigate, and successfully convoyed a fleet of merchant vessels from Marseille to the Levant, though they were attacked by two pirate-vessels, each of which was larger than his own. In 1785 he was put in command of the French fleet in the East Indies, and in 1787 he was made governor of Mauritius and the Isle of Bourbon. While in command of the East India fleet he made a voyage to China, and in 1791 he was given command of an expedition to search for La Pérouse, lost since Feb. 1788.

The expedition comprised the "Recherche" and "L'Esperance," with Captain Huon de Kermadec as second in command. No tidings were obtained of La Pérouse, but in the course of his search Entrecasteaux made important geographical discoveries. He traced the outlines of the east coast of New Caledonia, made surveys of the Tasmanian coast, and touched at several places on the south coast of New Holland. The two ships entered Storm bay, Tasmania, on April 21, 1792, and remained there until May 16, surveying and naming d'Entrecasteaux channel, the entrances to the Huon and Derwent rivers (the latter they called Rivière du Nord), Bruni island, and other places. They then sailed for the East Indies, and near Java Entrecasteaux died of scurvy on July 20, 1793.

See M. de Rossel, *Voyage de Dentrecasteaux* (1808).

ENTRE MINHO E DOURO (popularly called *Minho*), a province of northern Portugal; bounded on the N. by Galicia in Spain, E. by Traz-os-Montes, S. by Beira and W. by the Atlantic ocean. Pop. (1920) 1,304,461; area 2,790 sq.m. Of the mountain ranges the most important are the Serra da Peneda (4,728 ft.), between the rivers Minho and Lima; the Serra do Gerez (4,357 ft.), on the Galician border; the Serra da Cabreira (4,021 ft.), immediately to the south; and the Serra de Marão (4,642 ft.), in the extreme south-east. As its name implies, the province is bounded by two great rivers, the Douro (*q.v.*) on the south, and the Minho (Spanish *Miño*) on the north. There are three other large rivers which, like the Minho, flow west-south-west into the Atlantic. The Limia or Antela (Spanish *Linia*) rises in Galicia, and reaches the sea at Vianna do Castello; the Cavado forms, at its mouth, the small harbour of Espozende; and the Ave descends from its sources in the Serra da Cabreira to Villa do Conde. A large right-hand tributary of the Douro, the Tamega, rises in Galicia, and skirts the western slopes of the Serra de Marão.

The climate is mild, except among the mountains, and such plants as heliotrope, fuchsias, palms, and aloes thrive in the open throughout the year. Wheat and maize are grown on the plains, and other important products are wine, fruit, olives and chestnuts. As the province is occupied by a hardy and industrious peasantry, and the density of population (467·6 per sq.m.) is more than twice that of any other province on the Portuguese mainland, the soil is very closely cultivated. Small quantities of coal, iron, antimony, lead and gold are mined; granite and slate are quarried; and there are mineral springs at Monção, which is on the river Minho. The Oporto-Corunna railway traverses the western districts and crosses the Spanish frontier at Tuy; its branch lines give access to Braga, Guimarães and Povoa de Varzim; and the Oporto-Salamanca railway passes up the Douro valley. The chief towns are separately described; they include Oporto, one of the greatest wine-producing cities in the world; Braga, the seat of an archbishop who is primate of Portugal; the seaports of Povoa de Varzim and Vianna do Castello; and Guimarães.

ENTREPÔT, a storehouse or magazine for the temporary storage of goods; also a place where goods, which are not allowed to pass into a country duty free, are stored under the superintendence of the custom-house authorities till they are re-exported. Any town which has a considerable distributive trade is called an *entrepôt.*

ENTREPRENEUR. In economics, a term describing the person who assembles the various means of production, and by mobilizing them, renders them operative and useful. He is a promoter or initiator of production. The derivation is from Fr. *entre,* between; *prendre,* to take.

By making the factors of production operative, the entrepreneur earns a profit. What he needs in his operations are: (1) the use of land (a site) for which he pays rent; (2) the use of capital, for which he pays interest; (3) labour, for which he pays wages. By organizing the use of these to advantage, he seeks to make his own remuneration. What he buys for his operations constitutes the cost of production; that cost, plus his profit, amounts to the expenses of production.

The function of the entrepreneur is thus of the first importance. He may or may not be a landlord; he may or may not use in his operations his own capital; his essential function is that of industrial organizer. The owner of a site may or may not know how to use it; the owner of capital may or may not know how to make it fruitful; the worker with hand or brain may or may not know how to use his energies to advantage; it is the special business of the entrepreneur to know how best to make use of site, capital and labour. His is the function of enterprise, and in functioning he causes land, capital and labour to function. (*See* ECONOMICS.)

ENTRE RÍOS, an eastern province of the Argentine Republic lying between 30° and 34° S. lat. and 58° and 61° W. longitude. It is bounded north by the province of Corrientes, east by Uruguay river which separates it from Uruguay and south and west by the Paraná river which separates it from the provinces of Buenos Aires and Santa Fe. Pop. (1914) 425,373; 1925 estimate, 549,118 or 18·1 per square mile. The chief foreign groups were from Uruguay, Russia and Italy.

The province has an area of approximately 30,240 sq.m., consisting for the most part of an undulating, well watered and partly wooded plain with low hills bordering on the two great flanking rivers and a swampy district of limited extent in the angle between them. The great forest of Monteil occupies an extensive region in the north, estimated at nearly one-fifth the area of the province. Its soil is exceptionally fertile and the natural pasture lands are excellent for stock grazing. Its climate is mild and healthy. Entre Ríos is sometimes called the "garden of Argentina" and its agricultural development makes the reason evident. Its agricultural acreage for the year 1925–26 included 1,132,200 ac. of wheat; 1,495,000 ac. of linseed; 556,000 ac. of alfalfa; 209,000 ac. of oats; 189,000 ac. of maize (Indian corn); 24,700 ac. of potatoes; and 15,600 ac. of peanuts. Grapes are an important crop along the Uruguay river. Entre Ríos is one of the chief live stock producing provinces of the nation. Its live stock, according to the census of 1921, was as follows: cattle, 2,714,000; sheep, 2,710,000; horses 509,000; swine, 79,000. The manufacturing interests of the province are almost wholly dependent on agricultural and pastoral products. The chief exports are live cattle, jerked, chilled and tinned beef, beef extracts, mutton, wool, dairy products, wheat, linseed, fruits and a limited quantity of forest products. Lime and gypsum are the principal minerals. The Paraná and Uruguay rivers provide exceptional facilities for the shipment of produce and a network of 1,527 m. of railway operated by the Entre Ríos and the Argentine North Eastern railways, affords ample transportation facilities to the ports and to the provinces lying to the north and to the south.

The capital and chief city of the province is Paraná, a busy port on the Paraná river, with a population of 36,089 in 1914 and 47,000 (estimated) in 1926. Other important centres, with their population in 1926, are Concordia (27,680), Gualeguaychú (21,-622), Concepción de Uruguay (18,076), all important ports on the Uruguay; and Gualeguay (16,484) and Victoria (15,757). Entre Ríos, in its early history, suffered severely from political disorder and civil war. Comparative quiet reigned from 1842 to 1870 under the autocratic rule of Gen. J. J. Urquiza. After his assassination in 1870 these partisan conflicts were renewed for two or three years, and then the province settled down to a life of comparative peace, followed by an extraordinary development in her pastoral and agricultural industries. Educational and cultural institutions have increased to a remarkable degree during this era of peace and prosperity.

ENVER PASHA (1881–1922), leader of the Young Turks, was born at Apana, on the Black Sea coast, where his father was a bridge keeper and his mother followed the despised profession of laying out the dead. His father was Turkish, his mother Albanian and he had a Circassian grandmother. He entered the Turkish Army as a subaltern, and was sent to Salonika, where he came into touch with the leaders of the Young Turk movement. In 1908 as aide-de-camp of General Hussein Hilmi, he, with Niazi Bey, raised the flag of revolution in Macedonia, originally with the object of restoring the constitution of 1876, which had been disregarded by Abdul Hamid, but also to save himself from a threatened arrest. Abdul Hamid professed to yield, and Enver

entered Constantinople as a fêted hero. He then went to Berlin as major and military attaché, and there pursued his military studies, 1909–11. His stay was only once interrupted, when, in the year 1909, he hastened to Salonika, and with Mahmud Shevket undertook a brief and victorious campaign against the reactionaries.

After the deposition of Abdul Hamid, Enver returned to Berlin. He took command at Benghazi in the Italo-Turkish War and wrote a book called *Tripoli* (German version, 1918) dealing with this period. The Peace of Lausanne brought his work in Africa to an end, and he returned to Constantinople to find Turkey in the midst of the Balkan war. During the December armistice Enver, then a lieutenant-colonel, was made chief-of-staff of the X Army Corps, of which he soon was virtually in command. His attempt at a landing at Sharköi (in the east of the Gallipoli peninsula), on Feb. 8, 1913, miscarried. During the peace negotiations, when Kiamil, as the Grand Vizier, took the course of deferring to the wishes of the British, Enver with his friends arrived in front of the Sublime Porte, shot the War Minister, Nazim Pasha, turned out Kiamil, forced himself upon the Sultan, and in collusion with the Young Turk Committee filled all the offices with Young Turks. The new Vizier, Mahmud Shevket, was assassinated in June 1913, and this further enraged the Committee against the Old Turks and the Union Libérale. The body of the state was purged of all elements which would not blindly carry out the policy of the Committee. More than 1,200 officers, among them 153 generals and colonels, were dismissed by Enver in one day. In July 1913 he made a triumphal entry into Adrianople, which had already been evacuated by the Bulgarians. On Jan. 3, 1914, he promoted himself Minister of War.

When the World War broke out, Enver began to cherish strategical ambitions. In the winter of 1914–15 he led an entire Turkish Army in the disastrous offensive in the snow-covered mountains on the Russo-Turkish border. With Liman von Sanders, the chief of the German military mission in Constantinople, his relations were strained, and the situation was not improved by certain Germans who flattered Enver and intrigued against Liman von Sanders. He became a megalomaniac to whom no one offered advice, and though he had no share in the Dardanelles defence, he took all the credit for it. In internal politics he became, by degrees, the absolute ruler of the country, but when the Turkish collapse came he fled by way of Odessa to Germany. In 1919 he was condemned to death at Constantinople *in contumaciam*. In the same year, after a brief exile among friends in Germany, he fled to Russia. There at first he helped Denikin to maintain the independence of the Caucasus, but when Denikin approached the Entente Powers, Enver left him, stayed for a short time in Azerbaijan, and was mixed up in adventures in Asia Minor and with the Asiatic propaganda of the Soviet Government.

Finally he turned against the Soviet Government and leading an unsuccessful insurrection against them in the mountains of Russian Turkistan—a revival of the "Pan-Turanian" ambitions which he cherished during the War—he was killed at Douchembe, in Bukhara, on Aug. 4, 1922.

ENVOY, a diplomatic agent of the second rank. The word *envoyé* came first into general use in the 17th century, as a translation of the Lat. *ablegatus* or *missus* (*see* DIPLOMACY). Hence the word envoy is commonly used of anyone sent on a mission.

ENZELI LANGUAGE: *see* PAHLAVI.

ENZINAS, FRANCISCO DE (DRYANDER) (*c.* 1520–*c.* 1553), Spanish theologian, was born at Burgos and educated at Louvain. While in Wittenberg he was advised by Melanchthon to translate the New Testament from Greek into Spanish. This was published at Antwerp in 1543. Imprisoned in Brussels for heresy, he managed to escape about 1545, and returned to Wittenberg, where he wrote *The State of the Netherlands and of the Religion of Spain,* published first in Latin, then in French (Geneva, 1558). On Cranmer's invitation he came to England in 1548, and was made professor of Greek at Cambridge. Two years later he returned to the Continent. He died at Geneva.

ENZIO (*c.* 1225–1272), king of Sardinia, was a natural son of the emperor Frederick II., and married, in 1238, Adelasia, widow of Ubaldo Visconti and heiress of Torres and Gallura in Sardinia. Enzio took at once the title of king of Torres and Gallura, and in 1243 that of king of Sardinia, but his sovereignty existed in name alone. In July 1239 he was appointed imperial vicegerent in Italy, and sharing in his father's excommunication in the same year, took a prominent part in the war which broke out between the emperor and the pope. He commenced his campaign by subduing the march of Ancona, and in May 1241 commanded the forces which defeated the Genoese fleet at Meloria. Later he fought in Lombardy. He was wounded and taken prisoner by the Bolognese at Fossalta on May 26, 1249, and remained a captive until his death on March 14, 1272. His marriage with Adelasia had been declared void by the pope in 1243; he left one legitimate, and probably two illegitimate daughters.

See F. W. Grossman, *König Enzio* (Göttingen, 1883); and H. Blasius, *König Enzio* (Breslau, 1884).

ENZYMES. There are many chemical reactions which proceed alone at a very slow rate. By the addition of minute quantities of certain inorganic substances, termed catalysts, the rate of such reactions can be tremendously increased. Enzymes may be regarded as catalysts of biological origin which are formed in all living cells. They enable the cell to carry out the chemical processes necessary for its existence at a sufficient speed and at temperatures much below those which would be required in the laboratory.

It is now realized that most of the changes going on in the living cell are due to constituents similar to the zymase of the yeast cell, which brings about the fermentation of sugar. In many cases the enzymes act within the cell, but in others the enzymes are discharged from the cells which formed them and carry out their particular changes outside the cells. Thus the enzyme ptyalin, elaborated in the salivary gland cells, is discharged into the mouth, where it commences its action on the starch of the food.

The action of all enzymes shows certain characteristic features which closely resemble those shown by inorganic catalysts. The chemical reactions in which enzymes play a part are, so far as is known, reversible in type. In such reactions, an equilibrium point is reached at which the rate of the forward or breakdown process equals that of the reverse or synthetic process. In the presence of an enzyme the same equilibrium point is reached much more rapidly. Since the actual point of equilibrium reached depends solely on the ratio of the velocities of the forward and reverse reactions, the enzyme must accelerate both reactions equally. Thus enzymes are capable of increasing the rate of synthetic as well as breakdown processes. Which change will predominate depends on the concentration of the molecules involved and is not determined by the enzyme.

Enzymes show great specificity—a given enzyme will act only on a single substance or group of closely related substances. In the case of enzymes acting on carbohydrates this specificity is so extreme that it has been suggested that there must be a "lock and key" relationship between the enzymes and the molecule on which it acts—the substrate.

The activity of enzymes is influenced in a remarkable degree by factors such as temperature, acidity or alkalinity, and the presence of certain metallic salts. There is an optimum temperature for the action of an enzyme; above this temperature the enzyme is rapidly destroyed and its activity diminishes. Owing to this sensitiveness to external factors, an enzyme is frequently able to change only a limited amount of substrate, for the products of its activity accumulate and by their accumulation gradually inhibit the activity of the enzyme.

Enzymes are active in extremely minute amounts. Thus the enzyme invertase can hydrolyse one million times its weight of cane sugar without appreciable loss of activity. The majority of the reactions in which enzymes take part are hydrolytic, and involve the addition of the elements of water. Thus the enzymes of the alimentary canal break down the foodstuffs by hydrolysis. There are other types of enzyme action which are important, notably those concerned with oxidation processes. Enzymes accelerating such processes are known as oxidases, and to enzymes of

this class are due the colour changes seen when a cut potato or apple is exposed to the air.

The chemical structure of enzymes is not yet known. They were formerly regarded as proteins, but according to Euler and others they are not proteins, but are in colloidal combination with the cell proteins. Their sensitiveness to heat and other factors depends probably on this association. Willstätter conceives the molecule of an enzyme as consisting of a colloidal carrier and of a purely chemical active group. Complete separation of these is not yet possible. There is no doubt that, owing to its close association with a colloid, the enzyme molecule has an extensive surface area, and it appears certain that one of the first stages in the action of an enzyme is the concentration of molecules of the substrate on this surface by the physical process of adsorption. Whether a chemical combination between enzyme and substrate occurs has yet to be demonstrated.

EOCENE, in geology, the name suggested by Sir Charles Lyell in 1833 for the earliest period of the Tertiary era. The term was intended to convey the idea that this was the period which saw the dawn of the recent or existing forms of life, because it was estimated that among the fossils of this period only 3½% of the species are still living. Since Lyell's time much has been learned about the fauna and flora of the period, and many palaeontologists doubt if any of the Eocene *species* are still extant, unless it be some of the lowest forms of life. Nevertheless, the name is a convenient one and is in general use. The Eocene as originally defined was not long left intact, for E. Beyrich in 1854 proposed the term "Oligocene" for the upper portion, and later, in 1874, K. Schimper suggested "Palaeocene" as a separate appellation for the lower portion. The Oligocene division has been generally accepted as a distinct period, but "Palaeocene" is not so widely used. In the present article we shall include also the "Palaeocene" deposits. Although in Germany the Oligocene deposits are transgressive and cover wide areas from which the Eocene is absent, in France and southern England there is little or no break between the Eocene and Oligocene and it is much more logical to include the whole of the lower Tertiary in a single period. This is the tendency among modern stratigraphers and the names "Palaeogene," "Nummulitic" or "Older Tertiary Period" (in opposition to Neogene or Newer Tertiary Period) are widely used to embrace the Palaeocene, Eocene and Oligocene. As a whole, the Palaeogene System is characterized by the almost exclusive occurrence of *Nummulites* (a few early forms have been recorded from the highest Cretaceous); further, its stratigraphic unity is ensured since the upper and lower limits are marked each by periods of marine regression whose effects are traceable over practically the whole of Europe. There are, in fact, very few areas indeed where sedimentation proceeded uninterruptedly on the one hand from the Cretaceous to the Palaeogene and on the other hand from the Palaeogene to the Neogene.

The stratigraphy of the Eocene was first worked out in detail in the basins of Paris, Belgium, Hampshire and London with the result that the Anglo-Franco-Belgian basin has become the type area. This is unfortunate, since the deposits there, both in the Eocene and Oligocene periods, were laid down in a large but shallow gulf affected by a succession of secondary oscillations of level which have resulted in a complex series of alternating marine and continental deposits. A continuous succession of marine deposits is found in the Mediterranean area—laid down in the Tethys or Mediterranean sea of Eocene times which stretched from Italy to India and in which were evolved the series of Nummulites by which the subdivisions of the period are dated.

Conditions During the Eocene.—When, after the great regression at the end of the Cretaceous, the sea once more invaded Europe there was but little change in the structure of the continent as a whole. On the north and north-west lay the North Atlantic continent—represented to-day by the ancient massifs of Scandinavia, Scotland, Ireland, Wales and Cornubia. Running through the heart of Europe was an important land mass, the remnants of which are found to-day as the Bohemian massif, the Ardennes, Vosges and Black Forest, Central Plateau of France and the massif of Brittany. Between these two land masses lay the Northern sea, from which a broad gulf or "epicontinental sea" formed the Anglo-Franco-Belgian basin. To the west lay the Tertiary Atlantic ocean with gulfs covering south-west France and north-east Spain as the basins of Aquitaine and Aragon. To the south-east of Central Europe lay the Tethys, the great Mediterranean sea of early Tertiary times, covering the area where the Alps were yet to rise. The Tethys extended over Italy and most of south-eastern Europe, stretched across Asia Minor and Syria into Persia and India. Marginal seas and gulfs covered most of the Atlas region and stretched into Egypt, wide gulfs occupied Assam, Burma and much of the East Indies. In North America Eocene deposits are found in a succession of basins which fringed the Pacific ocean and covered parts of the present west coast. Eocene seas stretched over the Gulf of Mexico and the present West Indies, the south-eastern States and parts of Central America. Continental Eocene deposits cover a wide area in the heart of the continent. In South America, Africa and Australia the continental masses were beginning to assume their present form and the Eocene deposits are again found mainly in fringing basins. We are scarcely affected by the problem of whether these continental masses occupied the same position relatively to one another or whether they have drifted apart as envisaged in Wegener's theory of continental drift.

It is towards the centres of the larger Tertiary seas that Eocene sedimentation succeeds without a break that of the Cretaceous and where the boundary line is difficult to draw. This is the case in parts of Egypt, Denmark, some areas in northern India, as well as in the continental region of central North America. In the classical localities of England and France a great gap in time separates the Tertiary from the Mesozoic deposits, though the angular discordance between the Cretaceous and Eocene is usually but slight.

Associated, no doubt, with the slight crustal movements which closed the Cretaceous and inaugurated the Eocene period there were local and intermittent manifestations of volcanic activity throughout the period. Intrusive rocks are found in the Eocene of the central and northern Apennines. Tuffs, basalts and other igneous rocks appear also in many of the Rocky Mountain States, in Central America, the West Indies and South America.

It has been very generally assumed by geologists, mainly upon the evidence of plant remains, that the Eocene period opened with a temperate climate in the northern latitudes, later becoming almost subtropical. The frequent admixture of temperate forms with what are now tropical genera makes it difficult to speak with certainty as to the degree of warmth experienced. The meteorological researches of Dr. C. E. P. Brooks (*Climate through the Ages*, London, 1926) have tended to confirm the belief in the existence of a warmer climate over Europe in early or middle Eocene times, becoming cooler towards the close of the period. The difference in the character of the faunas of the Tethys and the Northern sea points fairly conclusively to the differentiation of climate-zones in Europe comparable to those of the present day.

Life of the Period.—By far the most abundant and characteristic marine organisms were the foraminifera which flourished in the warm seas in countless myriads. Foremost among these are the *Nummulites,* which by their extraordinary numerical development and great size, as well as by their wide distribution, demand special recognition. Many other genera are of almost equal importance as rock builders—*Orthophragmina, Lepidocyclina, Operculina, Assilina, Orbitolites, Miliola, Alveolina.* The Nummulites, together with the Orthophragmines and Lepidocyclines, are the best fossils on which to base wide range correlation. Their centre of evolution and dispersal was in the Mediterranean province, where they are abundant at all levels in such a way that "zonal assemblages" may be determined. Whilst the determination of species is very difficult and possible only to the

specialist, the following broad groups are easily recognizable and can be utilized by the field geologist:—

Oligocene—small nummulites and lepidocyclines.
Upper Eocene—small nummulites and orthophragmines.
Middle Eocene—large and small nummulites, orthophragmines and assilines.
Lower Eocene—small nummulites and orthophragmines.

It was only at certain periods that a temporary connection was established between the Eocene Mediterranean and such areas of the Northern sea as the Paris basin, hence it is only isolated species and not phylogenetic series which are found in the latter areas. Thus whilst sedimentation was continuous in the Anglo-Franco-Belgian basin there are marked faunal breaks with a sudden influx of new forms.

In the northern province only isolated corals occur but in the Mediterranean reef-building forms of modern genera flourished. This is strong evidence of the differentiation into climatic zones as at present with a warm Mediterranean and a cold Northern sea.

In the marine mollusca the most noteworthy change is the entire absence of ammonoids, the group which throughout the Mesozoic era had taken so prominent a place, but disappeared completely with the close of the Cretaceous. Nautiloids were more abundant than they are at present, but as a whole the Cephalopods took a more subordinate part than they had done in previous periods. On the other hand, gastropods and pelecypods found in the numerous shallow seas a very suitable environment, flourished exceedingly, and their shells are often perfectly preserved and in enormous numbers. Of the gastropod genera *Cerithium* with its estuarine and lagoonal forms is very characteristic and the series of mutations have been of great service in studying the detailed stratigraphy of the Paris basin. *Rostellaria, Voluta, Fusus, Pleurotoma, Conus* may also be cited. *Cardium, Venericardia, Crassatella, Cytherea, Lucina, Anomia, Ostrea* are a few of the many genera of pelecypods abundantly represented. Echinoderms are especially important in the Tethys and the warmer seas and include the sea urchins *Linthia, Conoclypeus,* etc.

Crustacea were fairly abundant and most of the orders as well as numerous families of modern insects were represented.

When we turn to the higher forms of life, the reptiles and mammals, we find a remarkable contrast between the fauna of the Eocene and those periods which preceded and succeeded it. The great groups of reptiles, whose members had held dominion on land and sea during most of the Mesozoic time, had almost entirely disappeared by the beginning of the Eocene; in their place placental mammals made their appearance and rapidly became the dominant group. Among the early Eocene mammals no trace can be found of the numerous and clearly-marked orders with which we are familiar to-day; instead we find obscurely differentiated forms, which cannot be fitted without violence into any of the modern orders. The early placental mammals were generalized types (with certain non-placental characters) with potentialities for rapid divergence and development in the direction of the more specialized modern orders. Thus, the Creodonta foreshadowed the Carnivora, the Condylarthra presaged the herbivorous groups; but before the close of this period, so favourable were the conditions of life to a rapid evolution of types, that most of the great orders had been clearly defined, though none of the Eocene genera are still extant. Among the early carnivores were *Arctocyon, Palaeonictis, Amblyctonus, Hyaenodon, Cynodon, Provivera, Patriofelis.* The primitive dog-like forms did not appear until late in the period, in Europe; and true cats did not arrive until later, though they were represented by *Eusmilus* in the Upper Eocene of France. The primitive ungulates (Condylarths) were generalized forms with five effective toes, exemplified in *Phenacodus.* The gross Amblypoda, with five-toed stumpy feet (*Coryphodon*), were prominent in the early Eocene; particularly striking forms were the *Dinoceratidae, Dinoceras,* with three pairs of horns or protuberances on its massive skull and a pair of huge canine teeth projecting downwards, *Tinoceras, Uintatherium, Loxolophodon* etc. These enormous creatures, whose remains are so abundant in the Eocene deposits of western America, died out before the close of the period. The divergence of the hoofed mammals into the two prominent divisions, the odd-toed and even-toed, began in this period, but the former did not get beyond the three-toed stage. The least differentiated of the odd-toed group were the Lophiodonts: tapirs were foreshadowed by *Systemodon* and similar forms (*Palaeotherium, Palaplotherium*); the peccary-like *Hyracotherium* was a forerunner of the horse, *Hyrachyus* was a primitive rhinoceros. The evolution of the horse through such forms as *Hyracotherium, Pachynolophus, Eohippus,* etc., appears to have proceeded along parallel lines in Eurasia and America, but the true horse did not arrive until later. Ancestral deer were represented by *Dichobune, Amphitragulus* and others, while many small hog-like forms existed (*Diplopus, Eohyus, Hyopotamus, Homacodon*). The primitive stock of the camel group developed in North America in late Eocene time and sent branches into South America and Eurasia. Certain very generalized forms (Gandodonta) are commonly considered to be ancestral edentates, while the Tillodonta, whose affinities are still uncertain, are often grouped with the rodents, though far larger than any modern members of this group. The Insectivores had Eocene forerunners, and the Lemuroids—probable ancestors of the apes—were forms of great interest. The Cetaceans were well represented by *Zeuglodon* and others.

The non-placental mammals although still numerous were taking a secondary place; *Didelphys,* the primitive opossum, is noteworthy on account of its wide geographical range.

Among the birds, the large flightless forms, *Eupterornis, Gastornis,* were prominent, and many others were present, such as the ancestral forms of our modern gulls, albatrosses, herons, buzzards, eagles, owls, quails, plovers. Reptiles are represented solely by still surviving orders; they are not very common, though the remains of crocodilians, tortoises, turtles and some large snakes are locally plentiful.

The flora of the Eocene period, although full of interest, does not convey the impression of newness that is afforded by the fauna. The reason for this difference is this: the newer flora had been introduced and had developed to a considerable extent in the Cretaceous period, and there is no sharp break between the flora of the earlier and that of the later period. The reason for this difference is that the flora of modern aspect, characterized by the dominance of the flowering plants, had already come into being in the Cretaceous period; hence in general facies there is no sharp line of demarcation between Cretaceous and Eocene floras. Early Eocene floras are tropical or sub-tropical in character but in post Ypresian times there is evidence of cooling climatic conditions. (*See* PALAEOBOTANY.)

Eocene Stratigraphy.—The lower limit of the Eocene (including the Paleocene) is, generally speaking, well defined. There is general agreement that the Danian stage forms the highest Cretaceous and that the Eocene commences with the Montian. In the Montian there are no longer *Rudistes* or *Ammonites* but, on the other hand, a series of *Cerithium,* decidedly Tertiary in aspect, appears. The upper limit of the Eocene is far from clearly defined; it is usually taken at the summit of the Bartonian stage (including the Ludian).

The type area for Eocene stratigraphy is the Anglo-Franco-Belgian basin. At the opening of the Eocene period a broad gulf advanced from the Northern sea (roughly from the area occupied by the North sea of to-day) and covered most of south-eastern England, north-eastern France, Belgium and Holland. The deposits laid down in that gulf are now found confined mainly to four tectonic basins—the basins of London, Hampshire, Paris and Belgium. Occasional outliers or relict blocks serve to connect these areas and to indicate the original extent of the beds. The Eocene sea advanced intermittently, more or less towards the south in the Paris basin, more or less towards the west in England. In the intervals between the marine phases and on the borders of the gulf, lacustrine, fluviatile and estuarine deposits were laid down. Sediment was poured into the basin by rivers flowing from the west in England and from the south in France.

The multiple variations in facies have led to the distinction of a crowd of stages and a very complex nomenclature. Many of the beds and stages separated have a purely local significance. The marine faunas reflect the variations in facies, it is very difficult to separate faunal differences due simply to changes in facies from those due to evolution and immigration. It was only at certain periods that the gulf was in direct communication via the Atlantic coast with the Mediterranean area, so that only at times is there a marked influx of species from the southern seas.

The very varied deposits are most simply grouped into six or seven stages. Each stage commenced with a marine invasion, followed by a shallowing of the sea and then by continental conditions, the whole abruptly terminated by the next marine invasion. The deposits of each stage correspond to a "cycle of sedimentation." It will be clear also that the deposits are predominantly marine towards the centre of the old gulf; predominantly continental towards its margins. The arrangement of the wedges of strata is illustrated in the annexed diagrams.

The *Montian Stage* (Mons, Belgium) marks the first episode in the invasion of the Tertiary sea. During the long period of emergence which separated the Cretaceous and Tertiary periods in this part of Europe, the Chalk of the Parisian region and Belgium had been carved into hills and valleys and the earliest Tertiary deposits occupy valleys invaded by the sea and consist of limestones very localized in their occurrence—in a trough near Mons, at Meudon near Paris, Laversines near Beauvais and at Vertus near Épernay. The Montian is absent in England. The *Landenian Stage* (Landen in Belgium) is marked by a widespread marine invasion, the deposits no longer confined to old valleys. Generally the lower Landenian deposits consist of glauconitic sands resting on a plane of marine denudation on the Chalk surface. At the base there is generally a layer of green coated flints in a clayey, glauconitic matrix (the Bullhead Bed of English geologists). This is succeeded by a series of sands (Thanet Sands of the London basin, Sables de Bracheux of the Paris basin, Lower Landenian of Belgium). In some parts of Belgium the lowest beds are pure white chalky marls (Heersian) with plant remains.

In the London basin a thin bed of rounded pebbles separates the Thanet sands from the glauconitic sands of the Woolwich Bottom Bed (the oldest Tertiary found in the Hampshire basin). Over nearly the whole of the old gulf the marine sands are succeeded by a series of freshwater sands and mottled clays (the Reading Beds of England, Upper Landenian of Belgium, Argile plastique of France) or by a series of estuarine clays and sands often crowded with brackish-water fossils such as *Cyrena* and *Cerithium*. These are the Woolwich Beds of England, the Lignites du Soissonnais of France. The lower marine base of the Landenian is often referred to as the Thanetian Stage; the upper continental stage as the Sparnacian. Only in East Kent—towards the centre of the old gulf—is there Landenian marine throughout. In the sandy beds of the Upper Landenian masses of sand consolidated by a siliceous cement are common which, when weathered out and left on the surface form "sarsens." The *Ypresian Stage* is marked by a still more widespread marine invasion. At the base are often beds of well rounded black flint pebbles with or without a sandy matrix (Blackheath Beds of England, Sinceny Beds of France). The fauna of the pebble beds consists of survivors from the Woolwich phase mixed with new marine invaders common to the overlying deposits. In East Kent purely marine, sandy equivalents of these beds are known as the Oldhaven Beds. In England and Belgium the principal member of the Ypresian Stage is a thick mass of dark blue clay—reaching nearly 500 feet in thickness in parts of the London basin. This is the famous London Clay—the Argile des Flandres or Argile Yprésien of Belgium—which is the most characteristic Tertiary formation of the London basin and in addition occupies large areas in the Hampshire basin. It is so well contrasted with all the underlying sandy beds in the London basin that the latter are often grouped together as the "Lower London Tertiaries." In the Paris basin the place of the London Clay is taken by a group of sands, richly fossiliferous—the Sands of Cuise from which the name Cuisian is derived and often used instead of Ypresian. The characteristic fossil of the sandy phase of the Ypresian is *Nummulites planulatus-elegans*. Towards the south-east in Belgium the clay passes upwards into some extremely fine sands—the Upper Ypresian or Sands of Mons-en-Pevèle. In England the sandy upper part of the London Clay is known as the Claygate Beds which pass up into the continental phase, the Bagshot Beds. On the hills of Essex the Bagshot Beds are represented by beds of shingle; south-west of London by a series of coarse, false-bedded sands which give rise to a delightful stretch of heathland for which the county of Surrey is well known. In the Hampshire basin the Bagshot Beds are very important and include the well known Alum Bay Leaf Beds, Bournemouth Leaf Beds and the Pipe Clays of Poole. They are there a succession of false-bedded sands with lenticular clay and pebble beds, all often highly charged with vegetable matter. In the Paris basin the continental Ypresian is represented by the "Sables à Unios" and at Ay near Épernay have furnished important mammalian remains.

The *Lutetian Stage* (Lutetia = Paris) in general marks the widest extent of the Eocene marine invasion. The Paris basin was undoubtedly thrown into communication with the Mediterranean area and enormous numbers of *Nummulites laevigatus-Lamarcki* swarmed into the basin and formed the most characteristic fossil of the stage. The Lutetian Stage is particularly well developed in the Paris basin and there, apart from the basal sandy beds, consists mainly of beds of limestone, the famous Calcaire grossier. Many beds, especially of the middle division, afford excellent building stone which has been widely quarried throughout the Paris basin. It is the presence of the Calcaire grossier which has given rise to the characteristic scenery of the Paris basin—wooded limestone plateaux intersected by steep sided valleys where the limestone has been cut through. The upper part of the Calcaire grossier is estuarine (caillasses) and represents the continental phase. In Belgium the Flanders Clay, in the Plain of Flanders, passes up into a group of glauconitic clays and sands—the "Paniselian" of Belgian geologists (from Mont Panisel near Mons). The contemporaneity of this series with the Lutetian is generally agreed, though some geologists regard the Paniselian as equivalent rather with the upper part of the London Clay. It does not yield *Nummulites laevigatus*. In the heart of Belgium the Ypresian sands are succeeded by white marine sands (Bruxellian) with this fossil and it is difficult to prove the contemporaneity of the Bruxellian and the Paniselian which are, however, probably two facies of the same deposit. The Bruxellian is well seen round Brussels. In England the Lutetian is represented by the lower part of the Bracklesham Beds, a group of sands, clays and carbonaceous sands well developed in the Hampshire basin and there yielding *Nummulites laevigatus*. Eocene beds, younger than the Bagshot Sands, are found in the London basin only over a small area in Surrey, and fossils are scarce.

The *Ledian* or *Auversian Stage* (Lede in Belgium; Auvers in the Paris basin) is represented in the Paris basin by a series of sands (Sables de Beauchamp, or the Sables moyens of the older geologists) in which the characteristic fossil is *Nummulites variolarius-Herberti*. A similar but thin group of sands overlies the Bruxellian in Belgium, whilst in the Hampshire basin this stage is represented by the upper part of the Bracklesham Beds with the same fossil. Fresh-water limestones occur on the borders of the Paris basin belonging to the upper part of the Auversian.

The *Bartonian Stage* (Barton, Hampshire in England) is not quite so clearly defined in its upper limits as the preceding stages and there is still more than one interpretation commonly accepted. In England the richly fossiliferous Barton clay of the Hampshire basin has near its lower limits a bed with *Nummulites prestwichii*. The clays pass up into marine sands (Barton Sands and Headon Hill Sands) and then into brackish and freshwater clays and sands fading gradually into the Lower Headon Beds. The limit of the Eocene in Hampshire is drawn sometimes at the base of the Lower Headon Beds—a line difficult to define—but more naturally at the base of the succeeding marine Middle Headon Beds. In the Paris basin, the marine Bartonian is thin (Sables de Marines or Marinesian) but the continental phase is well represented by the freshwater St. Ouen Limestone with *Planorbis, Limnaea,* etc.

Succeeding this, however, are the famous Montmartre gypsum deposits and the thin band of marl with stunted marine fossils (Ludian). The Paris basin seems to have been cut off from the sea at this period and to have formed a salt water lagoon in which the Ludian fauna was evolved *in situ* and the gypsum deposited. On the evidence of mammalian remains, the limit of Eocene and Oligocene must be drawn in or at the top of the main mass of gypsum. In Belgium the Ludian is followed by fine sands with *Nummulites wemmelensis* (=*N. prestwichii*) known as Wemmelian, but a higher thin stage of sandy clays, rarely seen, constitutes the Asschian of the Ludian of the Paris basin.

In England the famous Eocene sections are at either end of the Isle of Wight, the cliffs of the mainland from the Isle of Purbeck to the Solent and in the London basin in very numerous inland sections. Reference should be made especially to *Geology in the Field* (1910) and the *Proceedings of the Geologists' Association.*

In Denmark, Scandinavia and northern Germany the Eocene is for the most part poor in fossils and is usually hidden under the Quaternary. The interest of the first two regions lies in the continuous sequence which exists from the Cretaceous upwards. Over the large area in central Europe which separated the Northern sea of Eocene times from the Mediterranean, the Eocene deposits are very localized and consist of fluviatile sands and clays, red earths and lacustrine limestones.

As already mentioned the Atlantic of Eocene times extended over parts of south-west France and north-east Spain as broad gulfs. There are the small gulfs of Basse Loire with Lutetian deposits and the large gulf of Aquitaine. The latter had its greatest extent in Lutetian times; the oldest recognizable beds along the northern borders of the old gulf are Ypresian, along the south border in the beautiful cliff sections of Biarritz they are Lutetian. Elsewhere in the basin there is a complete series of deposits from the Cretaceous upwards. On the borders, as in the Paris basin, are continental deposits. There is no doubt that the chain of the Pyrenees existed in a rudimentary form even in the Eocene and separated the Aquitaine gulf from the Eocene area of the Ebro valley.

The deposits which were laid down in the Eocene geosyncline now represented by the Alps are very different from those of the northern basins. Thicknesses are measured by thousands of feet rather than by dozens; the beds are intensely folded and even metamorphosed; the principal beds are nummulitic limestones, often hard and crystalline, with thin marls and nummulitic sandstones. Such rocks are not only found in southern Europe, including all the Alpine tracts, the Balkans and southern Russia, but they are well developed in northern Africa, Asia Minor, Palestine and may be followed through Persia, Baluchistan and India to China and Tibet. Locally, as in Italy between Vicenzia and Verona (the Vicentin), one finds a littoral phase of the Alpine geosyncline with a complete series of Eocene deposits, except the Landenian, richly fossiliferous. In Italy the term "Priabonian" is often used instead of Bartonian and Ludian.

While the foraminiferal limestones were being formed over most of southern Europe, a series of clastic beds were in course of formation in the Carpathians and the northern Alpine region—viz. the Flysch (*q.v.*) and the Vienna sandstone. Some portions of this Alpine Eocene are coarsely conglomeratic, and in places there are boulders of non-local rocks of enormous dimensions included in the argillaceous or sandy matrix. The Flysch is sparingly fossiliferous and difficult to correlate. In Egypt one finds the Eocene deposits transgressive over a continent which lay to the south of the old ocean; the "Libyan" of older authors includes the highest Cretaceous and lower Eocene; the Mokattam—including the famous limestones with huge nummulites so well known near Cairo—represents the middle and upper Eocene. In the north of India, the Eocene has been divided into the Ranikot (Landenian-Ypresian), Laki (Lutetian) and Kirthar (Lutetian and Bartonian). Exact correlation with Europe is extremely difficult. The first of the three stages in the Himalayan uplift took place in the middle Eocene and even in early Eocene times there existed round the fringes of Asia a series of basins in which sediments were deposited in much the same way as in the Anglo-Franco-Belgian basin. Two excellent examples exist in the Gulf of Assam and the twin gulf of Burma. Unlike the northern European deposits the beds in the Burma gulf are upwards of 10,000 feet in thickness; the deposits towards the landward end of the gulf are predominantly continental—sands and fresh-water to estuarine clays; towards the seaward end of the gulf they are predominantly marine.

Broadly it may be said that the same is true of the Tertiary gulfs which fringe the North and South American continents. The deposits of the Atlantic and Gulf Coast tracts belong definitely to the epicontinental non-folded type; the deposits of the West Indies and the Pacific coastal chains are rather of the geosynclinal type, whilst the deposits in the interior of the continent are of continental type. On the Atlantic coast there are no nummulites and correlation with Europe is difficult. Alabama is typical of the Gulf Coast Eocene; the succession is:—

Upper—Jacksonian—Limestone with Orthophragmina.
Middle { Claibornian with a rich fauna of mollusca. / Chickasawan Sands and Lignites.
Lower—Midwayan or Clayton Limestones.

On the Pacific coast marine formations are found in California and Oregon; such are the Tejon series with lignite and coal; the Escondido series of southern California (7,000ft.), part of the Pascadero series of the Santa Cruz mountains; the Pulaski, Tyee, Arago and Coaledo beds—with coals in Oregon. In the Puget formation of Washington we have a great series of sediments, largely of brackish water origin, and in parts coal-bearing. The total thickness of this formation has been estimated at 20,000ft. (it may prove to be less than this), but it is probable that only the lower portion is of Eocene age. The most interesting of the North American deposits are those of the Rocky mountains and the adjacent western plains, in Wyoming, Nevada, Nebraska, Colorado, etc.; they are of terrestrial, lacustrine or aeolian origin, and on this account and because they are not strictly synchronous, there is considerable difficulty in placing them in their true position in the time-scale. The main divisions or groups are generally recognized as follows:—

Stages		*Mammalian fauna*
Uinta Stage (Ludian)		*Diplacodon*
Bridger Stage, upper (Bartonian)		*Telmatotherium*
Bridger Stage, lower (Upper Lutetian)		*Uintatherium*
Wind River Stage, upper (Lower Lutetian)		
Wind River Stage, lower (Ypresian)		*Bathyopsis*
Wasatch Stage	Landenian	*Coryphodon*
Torrejon Stage	Landenian	*Pandolambda*
Puerco Stage	Landenian	*Polymastodon*

See A. de Lapparent, *Traité de géologie* vol. iii. (5th ed., 1906) which contains a good general account of the period with numerous references to original papers. Also M. Gignoux *Géologie stratigraphique* (1926) for a more modern general account; L. D. Stamp, *Stratigraphy* (1923), for the British Isles, with references; P. Lemoine, *Géologie du Bassin de Paris;* H. F. Osborn, *The Age of Mammals* (1910) for the American mammalian horizons. (L. D. S.)

EOHIPPUS, the "four-toed horse," the earliest known stage in the ancestry of the horse, found in the Lower Eocene formations of the western United States. A number of skeletons and many skulls, jaws or other fragmentary specimens are preserved in American museums. The closely-related *Hyracotherium* of western Europe is known from a skull and a number of jaws. The species range from the size of a fox to that of a cat. The fore foot has four well-developed toes, the hind foot three, with tiny splints representing the first and fifth digits; the third digit in manus and pes is only slightly larger than the others. The radius and ulna are complete and separate, also the tibia and fibula. The incisors are small, spatulate; canines larger, pointed; molars with low rounded cusps partly converted into crests; premolars smaller and simpler than molars. The animal appears to have been digitigrade, walking upright upon the padded toes like the dog or cat, not resting only upon the hoof as do later modern horses. The progressive changes from *Eohippus* to the existing horses are shown in a series of intermediate stages in the American Tertiary formations (*see* EQUIDAE).

EOLITHS. The term Eoliths is used of those objects which belong to the dawn (Eos) of the stone (Lithos) age. It does not

denote naturally chipped stones of any age which appear, at first sight, to be human artefacts. True Eoliths are of Tertiary age. At a congress held in Paris in 1867 it was claimed that certain chipped flints found in Tertiary deposits at Thenay, near Orleans, were humanly fashioned. Many eolithic discoveries have been described, notably as follow: from upper Miocene lacustrine beds at Otta near Madrid, by Carlo Ribeiro in 1872; from the upper Miocene at Puy Courny near Aurillac (France), by J. B. Rames in 1877; from the gravels of the Kent plateau, by B. Harrison in 1899; and from the middle Oligocene at Boncelles (Belgium), by E. de Munck in 1907.

The opponents of the human origin theory for these objects considered (and consider) that natural forces can produce similar specimens (*see* FLINTS). Monsieur Boule has described flints which had passed through a cement-making machine at Mantes, near Paris, which seemed very similar to the Eoliths. Again, Monsieur l'Abbé Breuil showed that well-trimmed edges due solely to earth pressure flaking had been formed on flints collected from the base of the Eocene deposits in the Paris basin. The same phenomenon can be seen in the "Bull Head" beds of Essex and elsewhere. Some few years ago Reid Moir produced specimens from the Tertiary gravel and sand exposures near Ipswich. The finds included scraper-like and awl-like objects and a new type named by him the Rostrocarinate, a chipped flint, shaped like the inverted end of a Canadian canoe, flat underneath with a keel above. At first these finds too were rejected on the same grounds as before. It was further demonstrated that frequently several shades of patina were present; all the chipping could not therefore have been contemporary. Lately, however, specimens which comply with the necessary criteria for humanly fashioned tools (*see* FLINTS) have been unearthed—at one site in what appear to be definite "floors."

In East Anglia the more important Eolith sites so far discovered are near Ipswich in gravel pits at Fox Hall, at Thorington Hall, at Bramford, and at Bolton and Laughlin's pit. The Tertiary deposits were laid down over the lower parts of East Anglia at a time when the land stood at a low level, and shelly sands of Marine origin were formed in the shallow sea. When these deposits, or "Crags" as they are called, arose above high-water level for any length of time they supported a sparse vegetation, and, as it would seem, some of the earliest members of the human race. The Eoliths are associated, for the most part with a bone bed at the base of the "Red Crag." That the Eoliths cannot be of later age than the crags is clear, for the patina on them is that of the pebbles composing the gravels, which are dated by the included Tertiary fauna. Nor can it be claimed that natural forces had by grinding pebbles together chipped them at some earlier date and then washed them into the Crag during the process of its formation. For at Thorington Hall the material is mainly sand, with rare pebbles, and natural flaking due to differential movement of the gravels is thus precluded. Further, just above the implements were found bivalve shells with their delicate hinges unbroken. Had earth movement occurred, other than on a continent-building scale involving without contortion the whole countryside, the hinges would certainly have been smashed. Again there are at Fox Hall two distinct "floors" where implements have been found, both chips and also larger tools occurring together. This could not have occurred had there been a washing-in of older objects from a distance, for the selective action of water would have separated the heavier objects from the lighter chips. We must, therefore, be prepared to accept the fact of the existence of a tool-making animal, probably man, as long ago at least as the late Tertiary period.

BIBLIOGRAPHY.—For an account with bibliography see *Ancient Hunters* 3rd ed., by W. J. Sollas, chap. iii. (M. C. B.)

ÉON DE BEAUMONT, CHARLES GENEVIÈVE LOUISE AUGUSTE ANDRÉ TIMOTHÉE D' (1728–1810), commonly known as the CHEVALIER D'ÉON, French political adventurer, was born near Tonnerre in Burgundy on Oct. 7, 1728. He qualified as an advocate and contributed to Fréron's *Année littéraire*. Sent by Louis XV. to Russia on a secret mission (1755) he adopted a woman's dress, in order to become reader to the Empress Elizabeth. He was sent on a second mission to Russia, and was frequently employed on diplomatic errands during the Seven Years' War. He also served in the French army, and was wounded. In 1762 he was sent to London as agent, then as minister plenipotentiary. He was superseded, involved in legal disputes with his successor, and raised gossip by his *Les Loisirs du Chevalier d'Eon* (Amsterdam, 1774). Bets were laid on his sex, and when he returned to France the king decreed that he must wear woman's dress, which he did to the end of his life, though he frequently figured in fencing matches. He died in London on May 22, 1810. During the closing years of his life he is said to have enjoyed a small pension from George III. A post-mortem examination of the body conclusively established the fact that d'Eon was a man.

The best modern accounts are in the duc de Broglie, *Le Secret du roi* (1888); J. B. Telfer, *Strange Career of the Chevalier d'Eon* (1888); A. E. Vizetelly, *The True Story of the Chevalier d'Eon* (1895); O. Homberg and F. Jousselin, *Le Chevalier d'Éon* (1904); and A. Lang, *Historical Mysteries* (1904).

EOSINES, brilliant pink dyestuffs which are brominated or iodinated derivatives of fluorescein. (*See* DYES, SYNTHETIC.)

EÖTVÖS, JOZSEF, BARON (urt'vursh), Hungarian writer and statesman (1813–1871), was born at Buda on Sept. 13, 1813. He spent many years in western Europe, where he became acquainted with western liberal ideas and with the leaders of the Romantic movement. In the diet of 1839–40 he advocated Jewish emancipation, and in the columns of the *Pesti Hirlap* he put forward a plea for responsible government, without which, he maintained, the necessary reforms in Hungary could not be carried out. His novel, *The Village Notary* (1844–46), which is a Hungarian classic, was liberal and progressive in tendency, as were the romance *Hungary in 1514* and the comedy *Long Live Equality*. After the February revolution of 1848 he was minister of education in the first responsible Hungarian Government. On the retirement of the prime minister Batthyány, Eötvös retired to Munich for a time, and therefore took no active part in the War of Independence. But he served the cause of freedom by his *Influence of the Ruling Ideas of the 19th Century on the State* (Pest, 1851–54; German ed. Vienna and Leipzig, simultaneously). After his return to Hungary in 1851 he held aloof from politics. In 1859 he published his *Guarantees of the Power and Unity of Austria* (German ed., Leipzig, 1859), in which he sought a compromise in the monarchy which would permit of responsible government. In the diets of 1861, 1865 and 1867 he gave loyal and effective support to Deák. In the Andrássy cabinet of 1867 he was minister of education, the only one of the ministers of 1848 to return to office. He established the system of national education in Hungary. Good Catholic though he was (in matters of religion he had been the friend and was the disciple of Montalembert), Eötvös disliked the proclamation of the dogma of papal infallibility, promulgated in 1870, and when the bishop of Fehérvár proclaimed it, Eötvös cited him to appear at the capital *ad audiendum verbum regium*. He was a constant defender of the *Ausgleich* with Austria, and during the absence of Andrássy presided over the council of ministers. He died on Feb. 2, 1871.

Eötvös occupied as prominent a place in Hungarian literature as in Hungarian politics. The best of his verses are to be found in his ballads, but his poems are insignificant compared with his romances. It was *The Carthusians*, written on the occasion of the floods at Pest in 1838, that first took the public by storm. The Magyar novel was then in its infancy, being chiefly represented by the historico-epics of Jósiká. Eötvös modernized it, giving prominence in his pages to current social problems and political aspirations. The famous *Village Notary* came still nearer to actual life, while *Hungary in 1514*, in which the terrible Dozsa *Jacquerie* (*see* DOZSA) is so vividly described, is especially interesting because it rightly attributes the great national catastrophe of Mohács to the blind selfishness of the Magyar nobility.

Eötvös's works were collected in 17 vols. (1901–13). There is a good English version (London, 1850) and numerous German versions of *The Village Notary*, while *The Emancipation of the Jews* has been translated into Italian and German (Pest, 1841–42), and a German translation of *Hungary in 1514*, under the title of *Der Bauernkrieg in Ungarn* was published at Pest in 1850.

See Zoltan Ferenczi, *Baron Joseph Eötvös* (Hung.) (Budapest, 1903); this is the best biography.

EÖTVÖS, ROLAND VON, Baron (1848–1919), Hungarian physicist, son of Baron Josef Eötvös, was born in Budapest July 27, 1848. He studied at Budapest and Heidelberg, and in 1872 he was appointed professor of physics in the University of Budapest. In the following year he was elected member, and in 1889 president, of the Hungarian Academy of Sciences. From 1894–95 he was Minister of Public Instruction. His first scientific studies were connected with capillarity; in 1885 he published the result of these investigations in which he deduced the law connecting the variations of surface tension with temperature. From 1890 onwards he examined the phenomena connected with the problems of gravitation and of terrestrial magnetism. He constructed a number of magnetic instruments. Later he constructed the double-armed torsion balance. This so-called Eötvös-balance is an extremely delicate instrument for determining the variations of gravity quickly and accurately; it became an essential instrument for the location of subterranean materials. In a treatise which won him the Benecke prize from Göttingen university in 1909, Eötvös demonstrated with great exactitude that the attraction of bodies is independent of the quality of the substance. Towards the end of his life he studied the variations of the gravitation (*q.v.*) of bodies moving on the earth. He demonstrated by experiments that if a body moves towards the east it loses in weight. Eötvös showed the rotation of the earth by means of a slowly rotating gravity balance. He died in Budapest on April 8, 1919.

EÖTVÖS BALANCE: *see* Balance: *Torsion Balance.*

EPACRIDACEAE, a large family of dicotyledonous shrubs and trees, chiefly Australian, but also represented in India, New Zealand, South America and the Hawaiian islands. There are 30 genera and some 400 species. In Australia they fill the place occupied elsewhere by the Ericaceae (*q.v.*) or heath family. The flowers are usually white or red, symmetrical and pentamerous. The fruit is a capsule or a drupe. *Astroloma* is the Australian, *Lissanthe* the Tasmanian, cranberry. Species of *Epacris* are cultivated for ornamental flowers.

EPAMINONDAS (Epameinondas, Ἐπαμεινώνδας) (*c.* 418–362), Theban general, was born about 418 B.C. He was educated by Lysis of Tarentum, a Pythagorean philosopher in exile. In 385 he was fighting on the Spartan side in the attack on Mantineia, where he saved the life of Pelopidas. In 371 he represented Thebes at the congress at Sparta, and by his refusal to surrender the Boeotian cities under Theban control prevented the conclusion of a general peace. In the ensuing campaign he commanded the Boeotian army that met the Peloponnesian levy at Leuctra, and by a brilliant victory, due mainly to his innovations in tactics, at once established the predominance of Thebes among the land-powers of Greece.

These innovations were substantially the use of a 50-deep phalanx as a striking head, with the centre and left *en échelon* behind it, in close co-operation with cavalry on the flank. In 370, in support of the new Arcadian league, he took a large army into Laconia; here he dealt a lasting blow at Sparta's predominance in the Peloponnese by liberating the Messenians and rebuilding Messene. In 369 he forced the isthmus lines and secured Sicyon for Thebes; it was probably in this campaign that he founded Megalopolis, the centre of the Arcadian league. Somewhere about this time he seems to have been put on trial on some charge connected with his command; the evidence is conflicting: Plutarch says it was after the 370 campaign, that the charge was of exceeding his term, and that he was acquitted.

Diodorus' account is that it was after the 369 campaign, that the charge was laxity, and that he was removed from the command. Plutarch's account is to be preferred, but Diodorus may be right about the charge.

In the following year he served as a common soldier in Thessaly, and upon being reinstated in command contrived the safe retreat of the Theban army from a difficult position. Returning to Thessaly next year at the head of an army he procured the liberation of Pelopidas from the tyrant Alexander of Pherae without striking a blow. In his third expedition (366) to Peloponnesus, Epameinondas again eluded the isthmus garrison and won over the Achaeans to the Theban alliance. When subsequent complications threatened the position of Thebes in Peloponnesus he again mustered a large army in order to crush the newly formed Spartan league (362). After some masterly operations between Sparta and Mantineia, by which he nearly captured both these towns, he engaged in a battle on the latter site. His tactics (*see* Mantineia) were similar to those of Leuctra. His death on the field converted what was practically a complete victory into an unprofitable draw.

His title to fame rests mainly on his brilliant qualities both as a strategist and as a tactician; his influence on military art in Greece was of the greatest. For the purity and uprightness of his character he likewise stood in high repute; his culture and eloquence equalled the highest Attic standard. In politics his chief achievement was the final overthrow of Sparta's predominance in the Peloponnese; as a constructive statesman he displayed no special talent, and the lofty pan-Hellenic ambitions which are imputed to him at any rate never found a practical expression.

EPARCH, an official, a governor of a province of Roman Greece, ἔπαρχος, whose title was equivalent to, or represented that of the Roman *praefectus*. The area of his administration was called an eparchy (ἐπαρχία). The term survives as one of the administrative units of modern Greece, the country being divided into nomarchies, subdivided into eparchies, again subdivided into demarchies (*see* Greece: *Local Administration*). "Eparch" and "eparchy" are also used in the Russian Orthodox Church for a bishop and his diocese respectively.

EPAULETTE, properly a shoulder-piece (from Fr. *épaule*, a shoulder), and so applied to the shoulder-knot of ribbon to which a scapulary was attached, worn by members of a religious order. The epaulette was first used merely as a shoulder-knot to fasten the baldric, and the application of it to mark distinctive grades of rank was begun in France at the suggestion, it is said, of Charles Louis Auguste Fouquet, duc de Belle-Isle, in 1759. In modern times it always appears as a shoulder ornament for military and naval uniforms. At first it consisted merely of a fringe hanging from the end of the shoulder-strap or cord over the sleeve, but towards the end of the 18th century it became a solid ornament, consisting of a flat shoulder-piece, extended beyond the point of the shoulder into an oval plate, from the edge of which hangs a thick fringe, in the case of officers of gold or silver. The epaulette is worn in the British navy by officers above the rank of sub-lieutenant; in the army it ceased to be worn about 1855. It is worn by officers in the United States navy above the rank of ensign; since 1872 it is only worn by general officers in the army. In most other countries epaulettes were worn by officers until the World War. In the French army until 1914 they were worn by the men also, with a fringe of worsted, various distinctions of shape and colour being observed between ranks, corps and arms of the service. The "scale" is similar to the epaulette, but has no fringe.

ÉPÉE, CHARLES-MICHEL, Abbé de l' (1712–1789), French educationist famous for his work on behalf of the deaf and dumb, was born at Paris on Nov. 25, 1712, being the son of the king's architect. He became a canon of Troyes, but was deprived of his ecclesiastical functions on account of his Jansenist leanings. He then began to instruct two deaf mutes. The Spaniard Pereira was then in Paris, and it has been affirmed that it was from him that Épée obtained his manual alphabet. In any case there can be no doubt that he attained far greater success than Pereira or any of his predecessors, and that the whole system now followed in the instruction of deaf mutes virtually owes its origin to his intelligence and devotion. In 1755 he founded at his own expense a school for deaf mutes, which afterwards was succeeded

by the "Institution Nationale des Sourds Muets à Paris," founded by the National Assembly in 1791. He died on Dec. 23, 1789. He wrote *La Véritable Manière d'instruire les sourds et muets, confirmée par une longue expérience* (1784). His *Dictionnaire général des signes* was completed by his successor the abbé Sicard.

ÉPÉE-DE-COMBAT is a weapon still used in France for duelling and there and elsewhere (blunted, of course) for exercise and amusement in fencing. It has a sharp-pointed blade, about 35in. long, without any cutting edge, and the guard, or shell is bowl-shaped, having its convexity towards the point. The *épée* is the modern representative of the small-sword, and both are distinguished from the older rapier, by being several inches shorter and much lighter in weight. The small-sword (called thus in opposition to the heavy cavalry broadsword), was worn by gentlemen in full dress throughout the 18th century, and it still survives in the modern English court costume.

Methods of foil-fencing after the introduction of the fencing mask are described in the article. Jacob, a Parisian fencing-master, was the first to establish in the last quarter of the 19th century a definite method of the épée, which differed essentially from all its forerunners. He was soon followed by Baudry, Spinnewyn, Laurent and Ayat. The methods of the four first-named, not differing much *inter se,* are based on the perception that in the real sword fight, where hits are effective on all parts of the person, the "classical" bent-arm guard, with the foil inclining upwards, is hopelessly bad. It offers a tempting mark in the exposed sword-arm itself, while the point requires a movement to bring it in line for the attack, which involves a fatal loss of time. The épée is really in the nature of a short lance held in one hand, and for both rapidity and precision of attack, as well as for the defence of the sword-arm and the body behind it, a position of guard *with the arm almost fully extended, and épée in line with the forearm,* is far the safest. Against this guard the direct lunge at the body is impossible, except at the risk of a mutual or double hit (*le coup des deux veuves*). No safe attack at the face or body can be made without first binding or beating, opposing or evading the adverse blade, and such an attack usually involves an initial forward movement. Beats and binds of the blade, with retreats of the body, or counter attacks with opposition, replace the old foil-parries in most instances, except at close quarters. And much of the offensive is reduced to thrusts at the wrist or forearm, intended to disable without seriously wounding the adversary. The direct lunge (*coup-droit*) at the body often succeeds in tournaments, but usually at the cost of a counter hit, which would be fatal with sharp weapons.

Ayat's method, as might be expected from a first-class foil-player, is less simple. Indeed for years, too great simplicity marked the most successful épée-play, because it usually gained its most conspicuous victories over those who attempted a foil defence, and whose practice gave them no safe strokes for an attack upon the extended blade. But by degrees the épéists themselves discovered new ways of attacking with comparative safety, and at the present day a complete épée-player is master of a large variety of movements, both of attack and defence.

It was mainly by amateurs that this development was achieved. Perhaps the most conspicuous representative of the new school was J. Joseph-Renaud, a consummate swordsman, who had also been a champion foil-player. Lucien Gaudin, Alibert and Edmond Wallace may be also mentioned as among the most skilful amateurs, Albert Ayat and L. Bouche as professors—all of Paris. Belgium, Italy and England have also produced épéists quite of the first rank. The épée lends itself to competition far better than the foil, and the revival of the small-sword soon gave rise in France to "pools" and "tournaments" in which there was the keenest rivalry between all comers.

In considering the épée from a British point of view, it may be mentioned that it was first introduced publicly in London by C. Newton-Robinson at an important assault-at-arms held in the Steinway Hall on May 4, 1900. Professor Spinnewyn was the principal demonstrator, with his pupil, the late Willy Sulzbacher. The next day was held at the Inns of Court R. V. School of Arms, Lincoln's Inn, the first English open épée tournament for amateurs. It was won by W. Sulzbacher, C. Newton-Robinson being second, and Paul Ettlinger, a French resident in London, third. This was immediately followed by the institution of the Épée Club of London, which, under the successive presidencies of a veteran swordsman, Sir Edward Jenkinson, and of Lord Desborough, subsequently held annual open international tournaments. In 1906, the Amateur Fencing Association recognized the best-placed Englishman, Edgar Seligman (the actual winner), as the English épée champion.

Épée practice became popular among Belgian and Dutch fencers about the same time as in England, and this made it possible to set on foot international team-contests for amateurs, which have done much to promote good feeling and acquaintanceship among swordsmen of several countries. In 1903 a series of international matches between teams of six was inaugurated in Paris. Up to the year 1909 the French team uniformly won the first place, with Belgium or England second. In 1906 a British épée team of four, consisting of Lord Desborough, Sir Cosmo Duff-Gordon, Bart., Edgar Seligman and C. Newton-Robinson, with Lord Howard de Walden and Theodore Cook as reserves (the latter acting as captain of the team), went to Athens, to compete in the international match at the Olympic games. After defeating the Germans rather easily, the team opposed and worsted the Belgians. It thus found itself matched against the French in the final, the Greek team having been beaten by the French and the Dutch eliminated by the Belgians. After a very close fight the result was officially declared a tie. In fighting off the tie, however, the French were awarded the first prize.

In the Olympic games of London, 1908, the Épée International Individual Tournament was won by Alibert (France), but Montgomerie, Haig and Holt (England), took the 4th, 5th and 8th places in the final pool. In the International Team competition the English representatives, Daniell, Haig, Holt, Montgomerie and Amphlett, took second place to the French. Egerton Castle was captain of the English team.

The method of ascertaining the victor in épée tournaments as indeed with all three weapons, is by dividing the competitors into "pools," usually of six or eight fencers. Each of these fights an assault for first hit only, with every other member of the same pool, and he who is least often hit, or not at all, is returned the winner. If the competitors are numerous, fresh pools are formed out of the first two, three or four in each pool of the preliminary round, and so on until a small number are left for a final pool, the victor in which is the winner of the tournament.

An average épée weighs, complete, about a pound and a half, while a foil weighs approximately one-third less. The épée blade is triangular in section and almost exactly like that of the old small-sword after the abandonment of the *colichemarde* form, in which the *forte* of the blade was greatly thickened. In length from guard or shell to point it measures about 35in., and in width at the shell about $\frac{1}{2}\frac{3}{8}$in. From this it gradually and regularly tapers to the point. There is no cutting edge. The side of the épée which is usually held uppermost is slightly concave, the other is strengthened with a midrib, nearly equal in thickness and similar in shape to either half of the true blade. The material is tempered steel. There is a haft or tang about 8in. long, which is pushed through a circular guard or shell (*coquille*) of convex form, the diameter of which is normally 5in. and the convexity $1\frac{3}{4}$in. The shell is of steel or aluminium, and if of the latter metal, sometimes fortified at the centre with a disk of steel the size of a crown piece. The insertion of the haft or tang through the shell may be either central or eccentric to the extent of about 1in., for protection of the outside of the forearm.

After passing through the shell, the haft of the blade is inserted in a grip or handle (*poignet*), averaging 7in. in length and of quadrangular section, which is made of tough wood covered with leather, india-rubber, wound cord or other strong material with a rough surface. The grip is somewhat wider than its vertical thickness when held in the usual way, and it diminishes gradually from shell to pommel for convenience of holding. It should have a slight lateral curvature, so that in executing circular movements the pommel is kept clear of the wrist. The pommel, usually of

steel, is roughly spherical or eight-sided, and serves as a counter-balance. The end of the haft is riveted through it, except in the case of *épées démontables,* which are the most convenient, as a blade may be changed by simply unscrewing or unlocking the pommel. An épée is well balanced and light in hand when, on poising the blade across the forefinger, about 1in. in advance of the shell, it is in equilibrium.

For practice, the point is blunted to resemble the flat head of a nail, and is made still more incapable of penetration by winding around it a small ball of waxed thread, such as cobblers use. This is called the "button." In competitions various forms of *boutons marqueurs,* all of which are unsatisfactory, are occasionally used. The *pointe d'arrêt,* like a small tin-tack placed head downwards on the flattened point of the épée, and fastened on by means of the waxed thread, is, on the contrary, most useful, by fixing in the clothes, to show where and when a good hit has been made. The point need only protrude about $\frac{1}{16}$th of an inch from the button. There are several kinds of *pointes d'arrêt.* The best is called, after its inventor, the "Leon Sazie," and has three blunt points of hardened steel each slightly eccentric. The single point is sometimes prevented by the thickness of the button from scoring a good hit. A mask of wire netting is used to protect the face, and a stout glove on the sword hand. It is necessary to wear strong clothes and to pad the jacket and trousers at the most exposed parts, in case the blade should break unnoticed. A vulnerable spot is just under the sword-arm.

Recent Developments in Great Britain.—All that has been written under foil-fencing (*q.v.*) with regard to the increase in popularity and the more general appeal of the art to all classes, applies with even greater force to the épée. This is very natural for it is easier to become a moderate épée fencer, good enough to extract great enjoyment from the play, with far less time and study than to reach an equal degree of skill with the foil. Some of the many clubs which sprang up after the World War confined themselves to foil-fencing—all honour to them. Others, after a start with the foil, took up both épée and sabre later; some frankly discarded the foil and devoted themselves to the épée from the start. Given a good teacher of épée play pure and simple, it is quite possible for an adaptable pupil to reach a high degree of excellence with that weapon without preliminary training with the foil, a fact that is borne out by the history of the Grosvenor Fencing Club, a club formed towards the end of 1922, by Mr. G. M. Burt, who won the Épée championship of that year. By keenness and sheer hard work the members of this club made such steady improvement that in 1927 they won the Savage Shield, from a field that included all the leading clubs of London and the provinces. On the other side of the picture it must be noticed that the épée fencer, who has no original grounding with the foil, will rarely make a good foil or sabre fencer. A good foil fencer on the other hand can easily become a firstrate épée fencer, Mr. R. Montgomerie being a striking example.

The épée has been popularized not only in London and at the provincial Salles, it has even spread to the villages. Thanks to Mr. W. Godden, a veteran international fencer, a club for village lads was started in Buckinghamshire in 1926, and aroused much local enthusiasm. All the London hospitals have clubs, which fight with all three weapons, but specialize in épée play.

One feature of épée fencing which has arisen in latter years is to be deplored. Assaults with that weapon are now decided in international events by two hits out of three instead of by a single hit. There appear to be three good and sufficient arguments against this practice: (a) where the target is the whole body, such concentration is required that a single hit is quite sufficient to determine the issue; (b) the knowledge that a single hit is not fatal tends to carelessness over the first hit; (c) a fencer who has won the first hit can win the encounter equally with a good second hit or a *coup double,* and anything which tends to exploit the *coup double* is much to be deprecated.

The principal épée events held annually in London, in addition to the Amateur Championship, are the Épée competition of the Amateur Fencing Association, corresponding to the Foil competition, which is limited to fencers who have never reached the final pool of the Épée championship, nor competed in an international match, and the inter-Salle competition with teams of four for the Savage Shield. Épée Champions since 1910 are:—

1910	E. M. Amphlett	1922	G. M. Burt
1911	J. P. Blake	1923	M. D. V. Holt
1912	R. Montgomerie	1924	C. H. Biscoe
1913	C. G. M. Vereker	1925	Major C. B. Notley
1914	R. Montgomerie	1926	Hon. I. D. Campbell-Gray
1915–1919	No competition	1927	Major C. B. Notley.
1920	M. D. V. Holt		
1921	Captain H. F. S. Huntingdon

EPERJES: *see* PREŠOV.

ÉPERNAY, a town of northern France, capital of an arrondissement in the department of Marne, 88 m. E.N.E. of Paris on the main line of the Eastern railway to Châlons-sur-Marne. Pop. (1926), 19,067. The town stands on the left side of the valley of the Marne, where it receives the Cubry. Épernay (*Sparnacum*) belonged to the archbishops of Reims from the 5th to the 10th century, when it passed to the counts of Champagne. It suffered severely during the Hundred Years' War and was burned by Francis I. in 1544. It was captured by Henry of Navarre in 1592. In 1642, along with Château-Thierry, it was erected into a duchy and assigned to the duke of Bouillon.

In the central and oldest quarter the streets are narrow and irregular; the suburbs, especially that of La Folie, on the east, contain handsome villas. The town has also extended to the right bank of the Marne. One of its churches preserves a portal and stained-glass windows of the 16th century. Épernay is the principal *entrepôt* of the Champagne wines, which are bottled and kept in extensive vaults in the chalk rock on which the town is built. The manufacture of the apparatus and material used in the champagne industry occupies many hands, and the Eastern Railway Company has important workshops there. Épernay is the seat of a sub-prefect and has tribunals of first instance and of commerce.

ÉPERNON, a town of northern France in the department of Eure-et-Loir, at the confluence of the Drouette and the Guesle, 17 m. N.E. of Chartres by rail. Pop. (1926) 2,067. It belonged originally to the counts of Montfort, who, in the 11th century, built a castle here of which the ruins are still left, and granted a charter to the town. In the 13th century it became an independent lordship, which remained attached to the crown of Navarre till, in the 16th century, it was sold by King Henry (afterwards King Henry IV. of France) to Jean Louis de Nogaret, for whom it was raised to the rank of a duchy in 1581. The new duke of Épernon was one of the favourites of Henry III., who were called *les Mignons;* the king showered favours upon him, giving him the posts of colonel-general in the infantry and of admiral of France. Under the reign of Henry IV. he made himself practically independent in his government of Provence. He died in 1642. After the death of his second son Bernard (1661) the title of duke of Épernon was borne by the families of Goth and of Pardaillan.

EPHEBEUM, in architecture, a hall of an ancient Greek palaestra (buildings for exercise and meeting), reserved for the exercises of youths from 16 to 18 years old.

EPHEBI, a name given, in Athens and other Greek towns, to a class of young men from 18 to 20 years of age, who formed a sort of college under State control. On the completion of his 17th year the Athenian youth attained his civil majority, and, provided he belonged to the first three property classes and passed the scrutiny (*dokimasia*) as to age, civic descent and physical capability, was enrolled on the register of his deme. He thereby at once became liable to military training and duties. After admission to the college, the ephebus took the oath of allegiance and was sent to Munychia or Acte to form one of the garrison. At the end of the first year of training, the ephebi were reviewed, and, if their performance was satisfactory, were provided by the State with a spear and a shield, which, with the *chlamus* ("cloak") and *petasos* ("broad-brimmed hat"), made up their equipment. In their second year they were transferred to other garrisons in Attica,

patrolled the frontiers, and on occasion took an active part in war. During these two years they were free from taxation, and were not allowed to appear in the law courts as plaintiffs or defendants. During the Eleusinia they fetched the sacred objects from Eleusis and escorted the image of Iacchus on the sacred way (*see* MYSTERY).

After the end of the 4th century B.C. enrolment ceased to be obligatory, lasted only for a year, and the limit of age was discontinued; with the admission of foreigners the college lost its national character. The military element was no longer all-important, and the *ephēbia* became a sort of university for well-to-do young men of good family, whose social position has been compared with that of the Athenian "knights" of earlier times. The institution lasted till the end of the 3rd century A.D.

BIBLIOGRAPHY.—A whole chapter (42) of the Aristotelian *Constitution of Athens* is devoted to the subject. *See* also Daremberg and Saglio's *Dictionnaire des antiquités*, which contains further bibliographical references; G. Gilbert, *The Constitutional Antiquities of Athens* (Eng. trans., 1895); G. Busolt, *Die griechischen Staats- und Rechtsaltertümer* (1892); T. Thalheim and J. Ohler in Pauly-Wissowa, *Realencyklopädie der classischen Altertumswissenschaft*, v. pt. 2 (1905); L. Whibley, *Companion to Greek Studies* (1916).

EPHEDRA: *see* GYMNOSPERMS.

EPHEDRINE, an alkaloid (*see* ALKALOIDS) first prepared by Nagai (1887) from the Chinese drug "Ma Huang," since then found in other species of Ephedra, and having the composition $C_{10}H_{15}ON$. The naturally occurring laevo form has been synthesized and shown to be $CH_3{\cdot}NH{\cdot}CH(CH_3){\cdot}CH(OH){\cdot}C_6H_5$. It melts at 40° C, has a specific rotation $[\alpha]_D - 6{\cdot}3°$, and forms well defined salts. Ephedrine has become important, since 1925, as a partial substitute for adrenalin (*q.v.*), particularly in the treatment of asthma. (*See* EPHEDRA; JOINT-FIRS.)

EPHEMERIS. An ephemeris is a table giving, for stated points of time, the position or other numerical particulars of one or more of the heavenly bodies. Such tables are essential to the navigator, whose observations of the sun, moon, and stars would be valueless without a knowledge of their exact positions; to the astronomer who wishes to direct his telescope to a particular celestial object, or to check the time-keeping of his clock; and to the computer who predicts eclipses or the return of comets. The word ephemeris is frequently applied to a collection of such tables embodied in the form of an almanac, and it is used in that sense in the following remarks.

National Ephemerides.—The oldest of the five principal astronomical ephemerides is the *Connaissance des Temps ou des Mouvements Célestes,* founded by J. Picard in 1679 and published at Paris under the auspices of the Bureau des Longitudes. Its most distinguished superintendent was Le Verrier, immortalized as the co-discoverer with Adams of the planet Neptune.

The *Nautical Almanac,* which first appeared in 1766 for the year 1767, owes its existence to the initiative of Nevil Maskelyne, then Astronomer Royal. At that time no wholly satisfactory method of determining longitude at sea existed. The method of Lunar Distances, destined to become the standard method during the nineteenth century, but since discarded, was then impracticable because of the inaccuracy of the existing lunar tables, and because special knowledge and long and tedious computation were necessary in their use. When the tables of Tobias Mayer, of Göttingen, came into the hands of Maskelyne, he quickly realized their value to navigation. To make them practically useful, however, it was necessary to prepare from them an ephemeris of the moon for every noon and midnight, which should be published and made available to seamen. Maskelyne's representations to the Board of Longitude resulted in the establishment of the *Nautical Almanac* under his superintendence.

After the death of Maskelyne in 1811 the *Nautical Almanac* fell into disrepute and became notorious for its errors. As a result of many attacks made on it, principally by Francis Baily and Sir James South, the Admiralty appealed to the Royal Astronomical Society in 1830. The society appointed a strong committee, whose many recommendations were accepted in their entirety and embodied in the *Almanac* for 1834. Apart from improvements in the basic data from which the ephemerides are constructed, and a few changes made in 1896 at the suggestion of the Royal Astronomical Society, the form of the *Almanac* remained substantially unaltered until the issue of that for 1923, when the volume was completely re-cast. Changes necessitated by the alteration in 1925 of the beginning of the astronomical day from noon to midnight were made and consideration was given to the changed requirements of modern astronomers and of computers equipped with calculating machines.

As the greater part of the *Nautical Almanac* is not of interest to the seaman, the issue was commenced in 1914 of *The Nautical Almanac, Abridged for the Use of Seamen,* in which the material required for navigation was set up afresh, but only to the lesser degree of accuracy required by that science, Right Ascensions, for instance, being given to the nearest second only.

The third great national ephemeris emanated from Berlin, under the editorship of J. E. Bode. The first volume appeared in 1774, with the title *Astronomisches Jahrbuch oder Ephemeriden für das Jahr 1776.* In 1830 J. F. Encke changed the title to *Berliner Astronomisches Jahrbuch.* It is now produced by the Astronomisches Rechen-Institut, and is highly valued because of its presentation of data in a form adapted to the needs of workers in dynamical astronomy. A supplementary annual volume entitled *Kleine Planeten* contains opposition ephemerides of over 1,000 of the minor planets.

The *Almanaque Nautico y Ephemerides Astronomicas,* adapted to the Naval Observatory of San Fernando, near Cadiz, in Spain, appeared first in 1827 for the year 1830.

Finally the *American Ephemeris and Nautical Almanac* was first published at Washington in 1852 for the year 1855, the editor being Admiral C. H. Davis. Later, under the superintendence of Simon Newcomb, this ephemeris stepped into the front rank and became the best of the national ephemerides.

In addition to the ephemerides already enumerated, nearly every other country publishes one of its own, based on one or more of the above mentioned almanacs. The reason for this is the necessity for having the explanation and directions for use in the language of the country concerned, rather than any special requirements of its astronomers and navigators.

International Co-operation.—Although five extensive national ephemerides are printed they are not all computed independently. Conferences of the directors were held at Paris in 1896 and 1911, while more recently opportunities for co-operation have been afforded by the triennial meetings of the International Astronomical Union, one of whose "commissions" is devoted to ephemerides. The *Nautical Almanac* is responsible for the ephemerides of the sun and planets, using the tables prepared by Newcomb and G. W. Hill for the *American Ephemeris,* and of the moon, using the tables of E. W. Brown, which, since 1923, have replaced those of P. A. Hansen. The *Connaissance des Temps* prepares independent ephemerides of the sun and planets from the Le Verrier-Gaillot tables, and of the moon from Radau's tables based on Delaunay's theory. In addition it produces the apparent places of circumpolar stars, predictions of eclipses, and data for the four great satellites of Jupiter, based on the tables of R. A. Sampson. The *American Ephemeris* is charged with the production of elements of eclipses and occultations from the sun and moon data supplied by the *Nautical Almanac,* of sunrise, sunset, moonrise and moonset tables, and of tables relating to the satellites, and to physical observations of the sun, moon, and planets. The *Berliner Jahrbuch* undertakes the heavy task of preparing asteroid ephemerides, and also tables for the satellites of Saturn, from the elements of H. Struve. The *Almanaque Nautico* shares with the other ephemerides the work of producing apparent places of over 1,000 stars.

Tables of Heavenly Bodies.—Some reference has already been made to the tables used in producing the ephemerides. When a theory of the motion of a heavenly body has been evolved by a master of celestial mechanics, the available observations are used to supply the numerical constants of the theory. Then tables are formed by means of which the position of the body may be found for any desired date. These tables allow for every known gravitational effect acting on the body; for in-

stance, the effect of the attractions of other members of the solar system, and of changes in the size, shape, plane, and orientation of the orbit of the body. In Brown's *Tables of the Moon* no fewer than 1,400 terms are included, and the determination of a single position, which involves the use of 180 tables, is a good day's work for a computer.

Ephemerides of the apparent positions of stars are based on catalogues produced by combining all available observations of these stars and on a knowledge of the motions of the earth, which give rise to precession, nutation and aberration.

In the making of the observations from which these all-important tables and catalogues are formed, the national observatories have, of course, played a leading part; and in several of the ephemeris offices much work has been done in the analysis of these observations, in preparation of the numerical material on which the predictions are based, and in the production of working trigonometrical and other tables.

Computation of an Ephemeris.—The production of an ephemeris involves very heavy computing and careful checking, though it may perhaps be a matter for surprise that a calculation is rarely repeated. The principal check employed is known as differencing, and depends on the fact that the quantities are tabulated for equal intervals of time, and should exhibit a certain smoothness of progression. As a simple illustration of checking by differences, a column of numbers and their cubes may be considered. The process consists in subtracting each cube from the one following and setting down the result as the first difference. Similarly the second, third and higher differences may be found.

		Differences					Differences		
No.	Cube	First	Second	Third	No.	Cube	First	Second	Third
1	1				1	1			
		7					7		
2	8		12		2	8		12	
		19		6			19		6
3	27		18		3	27		18	
		37		6			37		5
4	64		24		4	64		23	
		61		6			60		9
5	125		30		5	124		32	
		91		6			92		3
6	216		36		6	216		35	
		127		6			127		7
7	343		42		7	343		42	
		169		6			169		6
8	512		48		8	512		48	
		217					217		
9	729				9	729			

In the table on the left the third differences are uniformly 6. In the other table 5^3 or 125 has been replaced by 124, with the result that the smoothness of the third difference is interrupted. The effect of an error of even a single unit in the last figure of a function is seen to be a considerable distortion of the smoothness of the final order of differences. Not only does the process of differencing provide a most powerful method of detecting accidental errors but it also enables the computer to locate the erroneous value and to determine the sign and magnitude of the error.

Calculating Machines.—Until the early part of this century tables of logarithms formed the chief tools of the computer, but the tendency now is to employ mechanical calculators whenever possible. The simplest of these is the adding machine, in which addition is performed by the depression of numbered keys. In the lunar and planetary tables, which consist of periodic sine or cosine terms, a constant is usually added to each table so that no negative numbers occur, and after adding perhaps 30 or 40 terms from as many tables a simple subtraction of the sum of the constants is made. Thus a Comptometer or other adding machine relieves the computer of the tedium of much mental addition, and, moreover, reduces the possibility of error.

Still more important are machines for multiplication and division. These are as a rule faster, more accurate, and less fatiguing than logarithms. Electrically driven machines such as the Monroe or Mercedes are particularly efficient in heavy work, while hand machines, such as the Nova-Brunsviga, are no less valuable for casual computations. Two special advantages possessed by calculating machines are that they will add products while forming them, and that they avoid the writing of intermediate figures.

The summation of a large number of the positive terms in Brown's *Tables of the Moon* is now done very efficiently by means of the Hollerith tabulating machine. Here the same numbers are used repeatedly, but never twice with the same partners. The numbers are, therefore, punched on to cards, which are arranged in the correct order and passed through the machine. The machine performs the necessary additions and prints the required results, while the cards are automatically re-sorted to be used again.

A mechanical integrator can be of the greatest assistance in ephemeris work. Quantities are frequently computed for every fourth or eighth day, and the intervening values obtained by the process known as interpolation. In the form usually employed this process is the reverse of that previously described as differencing, and in carrying it out the second differences of the new quantities are first obtained and then the column of values is formed by repeated summation. The ideal mechanical integrator would produce and print these new values and their differences. In 1908 a machine was built by Herr Hamann, and successfully used by Bauschinger and Peters for the production of 8-figure logarithm tables; but as this machine was subsequently stolen, and the plans used are lost, it cannot be reproduced.

In 1927 two commercial machines appeared, not specifically designed for mechanical integration, but able to perform the work very satisfactorily. One, the Brunsviga-Dupla, is a hand machine with a capacity of 15 figures, but no printing device. The other, an electric Burroughs machine with two distinct adding mechanisms, will add and print 13 figures, together with four figures of the argument, while all carriage and spacing movements are performed automatically. In addition to its use in the production of ephemerides such a machine lends itself readily to the computation of extensive mathematical and trigonometrical tables.

(L. J. C.)

EPHEMEROPTERA, an order of insects (*q.v.*), comprising the may-flies (*q.v.*) and their allies.

EPHESIANS, EPISTLE TO THE. This book of the New Testament, the most general of all the Pauline epistles and the one having least apparent reference to an immediate occasion, may be described as a solemn contemplation of the lofty privilege into which God's eternal purpose has brought believers in Christ, followed by an exhortation to conduct worthy of this high calling. Beneath this simple structure of the epistle and pervading the whole is the fully developed conception of Christ as central in the universe and in history. God's purpose from eternity was in the fulness of times to unite in Christ the Jews (to whom had been given the covenants of promise), and so to bring human history to its goal, the one New Man, the measure of the stature of the fulness of Christ. Those who have believed in Christ, that is the Church, represent the result of this redemptive work; and a clear knowledge of the purpose itself, the secret of the ages, has now been revealed to men. The theme of the epistle has often, but not quite adequately, been described as the Unity and Divinity of the Church.

The writer's exposition of Christian privilege takes the form of a great expanded use of the conventional introductory paragraphs of congratulation and prayer seen in other epistles of Paul as also in the Greek letters of simple people. In it, packed full of thought as it is, the writer touches on many profound aspects of his great conception (i. 3–ii. 10), then (ii. 11–iii. 13) points out the significance of the readers' position as Gentile believers, with a long digression (iii. 1–13) declaring his own (Paul's) commission by God's grace to preach to the Gentiles. This first half of the epistle closes with a renewed prayer for the strengthening of the readers in character and in the understanding of their great privilege (iii. 14–19) and with an ascription of eternal glory to almighty God (iii. 20–21).

In the second half the writer turns with a characteristic and impressive "therefore" to an exposition (iv.–vi.) of the responsibilities which the privilege entails, especially the preservation within the Church of unity in peace, on which, in harmony with his underlying theme, he enlarges in a notable passage (iv. 3–16).

Detailed warning against obvious vices (iv. 17–v. 14) merges in an exhortation to specific virtues (v. 15–vi. 9); and here in a series of paragraphs on the duties of wives, husbands, children, parents, slaves and masters Paul seems to be striving to find in the common relation of Christians to the Lord the principle of a new and specifically Christian (as distinguished from Jewish or Stoic) ethics. The power of moral achievement comes from God (vi. 10–18a). With an entreaty that the readers will pray for other Christians and for Paul himself, and with a note regarding Tychicus, the bearer of the letter, and a farewell benediction (vi. 18b–24) the epistle closes.

Title.—The title and opening verse of the epistle present a problem. Except for the edition of Marcion (*c.* A.D. 150), in which (possibly by an inference of identification from Col. iv. 16) it was entitled "To the Laodiceans," the epistle has in all periods (including the 2nd century) borne the title "To the Ephesians." But probably as early as the 2nd century, certainly in the 3rd and 4th centuries and subsequently, there were in circulation excellent copies (including our Codices Vaticanus and Sinaiticus of the 4th century) which omitted the words "in Ephesus" from the first verse. The most natural explanation is that these words were lacking in the original and were later added to the verse from the title which the epistle had received when the collection of Paul's epistles was adapted for church use. To this would correspond the absence of reference in the epistle to the members and conditions of any single Gentile church; and altogether the book is best understood as a circular letter intended for a considerable group of churches, of which that at Ephesus may have been one. As a letter addressed to the church at Ephesus alone, where in a long period of years Paul had acquired uncounted friendly connections and of which he must have had abundant knowledge, the epistle would be incomprehensible. That it is, however, "the letter (to be got) from Laodicea" mentioned in Col. iv. 16 is not improbable.

Resemblance to Colossians.—The relationship, both literary and theological, between the Epistle to the Ephesians and that to the Colossians (*q.v.*) is very close. Many of the prominent ideas of the two writings are the same, especially the developed view of the central position of Christ in the whole universe; the conception of the Church as Christ's body, of which He is the head; the thought of the great Mystery, once secret, now revealed. There is further resemblance in the formal code of morals, similarly arranged by classes of persons and having much the same contents in the two epistles (Eph. v. 22–vi. 9; Col. iii. 18–iv. 1). In both cases Tychicus carries the letter, and in almost identical language the readers are told that he will by word of mouth give fuller information about the apostle's affairs (Eph. vi. 21–22; Col. iv. 7–8). Moreover, in a great number of characteristic phrases and even whole verses the two are alike. *See*, for instance, Eph. i. 7, Col. i. 14; Eph. i. 10, Col. i. 20; Eph. i. 21, Col. i. 16; Eph. i. 22, 23, Col. i. 18, 19; Eph. ii. 5, Col. ii. 13; Eph. ii. 11, Col. ii. 11; Eph. ii. 16, Col. i. 20; Eph. iii. 2, 3, Col. i. 25, 26, and many other parallels (very fully set forth in Moffatt's *Introduction*, pp. 375–381). Only a comparison in detail can give a true impression of the extraordinary degree of resemblance. Yet the two epistles do not follow the same course of thought, and their contents cannot be successfully exhibited in a common synoptical abstract. Each has its independent occasion, purpose, character and method; but the two draw on a common store of thought and use common means of expression.

Genuineness.—The earliest evidence of use of Ephesians (1 Peter [not later than *c.* 100 A.D.], Ignatius, Polycarp and Hermas), and of the general 2nd-century acceptance of its claim to be by Paul (Irenaeus, Tertullian, Clement of Alexandria, Muratorian Canon), is as complete as the remains of early Christian literature reasonably permit; but on internal grounds objections to the genuineness of the epistle have been pressed since the early part of the 19th century. In recent years a certain, but by no means universal, tendency among critics to accept Ephesians as genuine has followed the somewhat stronger reaction in favour of Colossians. As a matter of fact the question of authorship is less important to the student of the history of Christian thought than in the case of other Pauline epistles, because of the lack in Ephesians of specific allusions to the situation. The place of its ideas in Christian history is not very different whether they were those of Paul in his later years or of an otherwise unknown great writer in profound sympathy with Paul's thought but living in the period following the apostle's death.

The objections to the genuineness of the epistle consist partly of literary observations and points of detail, and these have on the whole not proved convincing. (1.) The style has a slow and cumbrous movement; but parallels can be found elsewhere in Paul (*e.g.*, Rom. iii. 23–26), while many positive traits of Pauline style can be pointed out in Ephesians. (2.) The vocabulary is not more distinctive than, for instance, that of Galatians. (3.) Such phrases as "the devil" (iv. 27, vi. 11, as in the Pastoral epistles, instead of "Satan" as in Paul's other epistles), "his holy apostles and prophets" (iii. 5, *cf.* ii. 20), "mystery" (v. 32) in a sense not exactly the same as any of the other various meanings of the word in Paul, with other similar considerations often adduced, are not sufficient to prove that another than Paul was the author. (4.) The relation to Colossians is to some a ground of suspicion, but to others seems best explained by accepting a common Pauline authorship for both epistles. Holtzmann's ingenious theory (1872) that our Epistle to the Colossians, while based on a genuine shorter letter of Paul, is the product of expansion by the same later hand which created Ephesians has gained but limited support from recent scholars.

The more serious objections come from the advanced Christology and the terms of Alexandrian philosophy used in stating it, together with the developed conception of the Church as undivided and as the body of Christ. These ideas, however, do not seem to lie beyond the possibility of inclusion within Paul's horizon, and Colossians, if accepted as genuine, provides Pauline parallels for most of them. That the thought of the epistle implies the atmosphere and situation of the 2nd century is a position which cannot be sustained.

On the other hand, Ephesians shows profound and subtle agreement with the distinctive modes of thought, ruling interests, and religious language of Paul. So full an understanding and complete a resemblance in thought on the part of another writer would be without a parallel in that period (even 1 Peter is far less close). Highly significant is the strong pride of Jewish race exhibited in Eph. ii. 11–22 combined with the writer's extreme satisfaction in the opening of salvation in Christ to the Gentiles to whom the epistle is addressed.

Date and Place.—If Ephesians was written by Paul, it was composed during the period of his imprisonment, either at Caesarea or at Rome (iii. i.; iv. 1; vi. 20). The theory lately advanced of an imprisonment at some time during the three years' stay at Ephesus is improbable. At very nearly the same time he must have written Colossians and Philemon; all three were sent by Tychicus. There is no strong reason for supposing that the three were written from Caesarea. In favour of Rome are the greater probability of the metropolis as the place where a fugitive slave would hide himself, the impression given in Colossians of opportunity for active mission-work (Col. iv. 3, 4; *cf.* Acts xxviii. 30, 31), and the fact that Philippians, which in a measure belongs to the same group, was pretty certainly written from Rome. Ephesians is not intended merely for Gentile Christians at large, for Tychicus carries the letter to the readers, Paul has some general knowledge of their circumstances (i. 15), and they are explicitly distinguished from "all the saints" (iii. 18, vi. 18). We may most naturally think of them as the members of the churches of Asia.

EPHESUS, an ancient Ionian city on the west coast of Asia

Minor. In historic times it was situated on the lower slopes of the hills, Coressus and Prion, which rise out of a fertile plain near the mouth of the river Caÿster, while the temple and precinct of Artemis or Diana, to the fame of which the town owed much of its celebrity, were in the plain itself, E.N.E. at a distance of about a mile. But there is reason to think both town and shrine had different sites in pre-Ionian times, and that both lay farther south among the foot-hills of Mt. Solmissus. The situation of the city was such as at all times to command a great commerce. Of the three great river basins of Ionia and Lydia, those of the Hermus, Caÿster and Maeander, it commanded the second, and had already access by easy passes to the other two.

HISTORY

The earliest inhabitants assigned to Ephesus by Greek writers are the "Amazons," with whom we hear of Leleges, Carians and Pelasgi. In the 11th century B.C., according to tradition (the date is probably too early), Androclus, son of the Athenian king Codrus, landed on the spot with his Ionians and a mixed body of colonists; and from his conquest dates the history of the Greek Ephesus. The deity of the city was Artemis; but we must guard against misconception when we use that name, remembering that she bore close relation to the primitive Asiatic goddess of nature, whose cult existed before the Ionian migration at the neighbouring Ortygia, and that she always remained the virgin-mother of all life and especially wild life, and an embodiment of the productive power of the earth. The well-known monstrous representation of her, as a figure with many breasts, swathed below the waist in grave-clothes, was probably of late and alien origin. In early Ionian times she seems to have been represented as a natural matronly figure, sometimes accompanied by a child, and to have been a more typically Hellenic goddess than she became in the Hellenistic and Roman periods.

Croesus and the Persians.—Twice in the period 700–500 B.C. the city owed its preservation to the interference of the goddess; once when the Cimmerians overran Asia Minor in the 7th century and burnt the Artemision itself; and once when Croesus besieged the town in the century succeeding, and only retired after it had solemnly dedicated itself to Artemis, the sign of such dedication being the stretching of a rope from city to sanctuary. Croesus presented most of the columns required for the restoration of the temple of Artemis, as well as some cows of gold. To counteract, perhaps, the growing Lydian influence, Athens, the mother-city of Ephesus, despatched one of her noblest citizens, Aristarchus, to restore law on the basis of the Solonian constitution. The labours of Aristarchus seem to have borne fruit. It was an Ephesian follower of his, Hermodorus, who aided the Decemviri at Rome in their compilation of a system of law about the middle of the 5th century B.C. And in the same generation Heraclitus, probably a descendant of Codrus, quitted his hereditary magistracy in order to devote himself to philosophy, in which his name became almost as great as that of any Greek. Poetry had long flourished at Ephesus. From very early times the Homeric poems found a home and admirers there; and to Ephesus belong the earliest elegiac poems of Greece, the war songs of Callinus, who flourished in the 7th century B.C. and was the model of Tyrtaeus (*q.v.*). The city seems to have been more than once under tyrannical rule in the early Ionian period; and it fell thereafter first to Croesus of Lydia, and then to Cyrus, the Persian, and when the Ionian revolt against Persia broke out in the year 500 B.C. under the lead of Miletus, the city remained submissive to Persian rule. When Xerxes returned from the march against Greece (478 B.C.), he honoured the temple of Artemis, although he sacked other Ionian shrines, and even left his children behind at Ephesus for safety's sake. After the final Persian defeat at the Eurymedon (466 B.C.), Ephesus for a time paid tribute to Athens, with the other cities of the coast, and Lysander first and Agesilaus afterwards made it their headquarters. To the latter fact we owe a contemporary description of it by Xenophon. In the early part of the 4th century it fell again under Persian influence, and was administered by an oligarchy.

From Alexander to the Romans.—Alexander the Great was received by the Ephesians in 334, and established democratic government. Soon after his death the city fell into the hands of Lysimachus, who introduced fresh Greek colonists from Lebedus and Colophon and renamed the city after his wife Arsinoë; but the old name was soon resumed. Ephesus was very prosperous during the Hellenistic period, and is conspicuous both then and later for the abundance of its coinage, which gives us a more complete list of magistrates' names than we have for any other Ionian city. The Roman coinage is remarkable for the great variety and importance of its types. After the defeat of Antiochus the Great, king of Syria, by the Romans, Ephesus was handed over by the conquerors to Eumenes, king of Pergamum, whose successor was Attalus Philadelphus. The third Attalus of Pergamum bequeathed Ephesus with the rest of his possessions to the Roman people, and it became for a while the chief city, and for longer the first port, of the province of Asia, the richest in the empire.

Henceforth Ephesus remained subject to the Romans, save for a short period, when, at the instigation of Mithridates Eupator of Pontus, the cities of Asia Minor revolted and massacred their Roman residents. The Ephesians even dragged out and slew those Romans who had fled to the precinct of Artemis for protection, notwithstanding which sacrilege they soon returned from their new to their former masters, and even had the effrontery to state, in an inscription preserved to this day, that their defection to Mithridates was a mere yielding to superior force. Sulla, after his victory over Mithridates, brushed away their pretexts, and inflicted a very heavy fine. In the civil wars of the 1st century B.C. the Ephesians twice supported the unsuccessful party, giving shelter to, or being made use of by, first Brutus and Cassius, and afterwards Antony.

The Christian Period.—All this time the city was gradually growing in wealth and in devotion to the service of Artemis. The story of St. Paul's doings there illustrates this fact, and the sequel is very suggestive—the burning, namely, of books of sorcery of great value. Addiction to the practice of occult arts had evidently become general in the now semi-orientalized city. The Christian Church which Paul planted there was governed by Timothy and John, and is famous in Christian tradition as a nurse of saints and martyrs. According to local belief, Ephesus was also the last home of the Virgin, who was lodged near the city by St. John and there died. But later events show that the pagan tradition of Artemis continued very strong and perhaps never became quite extinct in the Ephesian district. The city was proud to be termed *neocorus* or servant of the goddess.

Ephesus contested stoutly with Smyrna and Pergamum the honour of being called the first city of Asia; each city appealed to Rome, and we still possess rescripts in which the emperors endeavoured to mitigate the bitterness of the rivalry. One privilege Ephesus secured; the Roman governor of Asia always landed and first assumed office there: and it was long the provincial centre of the official cult of the emperor, and seat of the Asiarch. The Goths destroyed both city and temple in A.D. 262, and although the city revived and the cult of Artemis continued, neither ever recovered its former splendour. A general council of the Christian Church was held there in 431 in the great double church of St. Mary, which is still to be seen. On this occasion Nestorius was condemned, and the honour of the Virgin established as *Theotokus*, amid great popular rejoicing, due, doubtless, in some measure to the hold which the cult of the virgin Artemis still had on the city. Thereafter Ephesus seems to have been gradually deserted owing to its malaria; and life transferred itself to another and higher site (Ayassoluk) near the Artemision. The ruins of the Artemision, after serving as a quarry to local builders, were finally covered deep with mud by the river Caÿster, or one of its left bank tributaries, the Selinus, and the true site remained unsuspected until 1869.

EXCAVATIONS

The first light thrown on the topography of Ephesus was due to the excavations conducted by the architect, J. T. Wood, on behalf of the trustees of the British Museum, during the years

1863–1874. He first explored the Odeum and the Great Theatre situate in the city itself, and in the latter place found an inscription which indicated in what direction to search for the Artemision. Following up this clue, Wood lighted first on a ruin which he believed to be the tomb of Androclus, and afterwards on an angle of the wall of the time of Augustus. Soon afterwards he struck the actual pavement of the Artemision on the last day of 1869.

Excavation of the Artemision.—Wood removed the whole stratum of superficial deposit which overlay the huge area of the temple, and exposed to view not only the scanty remains of the latest edifice, built after 350 B.C., but the platform of an earlier temple, now known to be that of the 6th century to which Croesus contributed. Below this he did not find any remains. He sent to England parts of several sculptured drums of the latest temple, and archaic sculptures from the drums and parapet of the earlier building. He also made a plan of the Hellenistic temple, found many inscriptions and a few miscellaneous antiquities, and had begun to explore the Precinct, when the trustees of the British Museum suspended his operations in 1874. The site lay desolate till 1904, when the trustees sent D. G. Hogarth to re-examine the remains. Wood's "earliest temple" was re-cleared and planned, remains of three earlier shrines were found beneath it, a rich deposit of offerings, etc., belonging to the earliest shrine was discovered, and tentative explorations were made in the Precinct. This deep digging, however, resulted in the permanent flooding of the site.

History of the Artemision.—The history of the Artemision, as far as it can be inferred from the remains, is as follows. (1) There was no temple on the plain previous to the Ionian occupation, the primeval seat of the nature-goddess having been in the southern hills, at Ortygia (near mod. *Arvalia*). Towards the end of the 8th century B.C. a small shrine came into existence on the plain. This was little more than a small platform of green schist with a sacred tree and an altar, and perhaps later a wooden image, the whole enclosed in a *temenos*. But this early shrine was presently enriched by Greeks with many and splendid offerings of Hellenic workmanship. The whole treasure can be dated to a period considerably anterior to the reign of Croesus. This treasure is now divided between the museums of Constantinople and London. (2) Within a short time, perhaps after the Cimmerian sack (? 650 B.C.), this shrine was restored, slightly enlarged, and raised in level, but not altered in character. (3) About the close of the century the shrine was replaced by a temple of regular Hellenic form. The latter was built in relation to the earlier central statue-base, but at a higher level than either of its predecessors, doubtless for dryness' sake. There is now no certain evidence of its architectural character; but it is very probable that it was the early temple in which the Ionic order is said to have been first used, after the colonists had made use of Doric in their earlier constructions; and that it was the work of the Cnossian Chersiphron and his son, Metagenes, always regarded afterwards as the first builders of a regular Artemision. Their temple is said by Strabo to have been made bigger by another architect. (4) The latter's work must have been the much larger temple, exposed by Wood, and usually known as the Archaic or Croesus temple. This overlies the remains of No. 3, at a level higher by about a metre, and the area of its *cella* alone contains the whole of the earlier shrines. Its central point, however, was still the primitive statue-base, now enlarged and heightened. About half its pavement, parts of the *cella* walls and of three columns of the peristyle, and the foundations of nearly all the platform, are still in position. The visible work was all of very fine white marble. Fragments recovered show that the workmanship and Ionic style were of the highest excellence, and that the building presented a variety of ornament, rare among Hellenic temples. The whole ground-plan covered about 80,000 sq.ft. The height of the temple is doubtful. Judged by the diameter of the drums, the columns of the Croesus temple were not two-thirds of the height of those of the Hellenistic temple.

This fourth temple is, beyond question, that to which Croesus contributed, and it was, therefore, in process of building about 540 B.C. It took 120 years to complete. It was dedicated probably between 430 and 420 B.C., and the famous Timotheus, son of Thersander, carried off the prize for a lyric ode against all comers. Its original architects were, probably, Paeonius of Ephesus, and Demetrius, a priest of the shrine itself. Of this temple Herodotus speaks as existing in his day; and unless weight be given to an isolated statement of Eusebius, that it was burned about 395 B.C., we must assume that it survived until the night when one Herostratus, desirous of acquiring eternal fame if only by a great crime, set it alight. This is said to have happened in 356 B.C. on the October night on which Alexander the Great came into the world. But the exactness of this portentous synchronism makes the date suspect. (5) It was succeeded by what is called the Hellenistic temple, begun almost immediately after the catastrophe, according to plans drawn by the famous Dinocrates the architect of Alexandria. The platform was once more raised to a higher level by means of huge foundation blocks bedded upon the earlier structures. The new columns were of greater diameter than the old and over 60 ft. high; and from its great height the whole structure was regarded as a marvel, and accounted one of the wonders of the world. Since, however, other Greek temples had colonnades hardly less high, and were of equal or greater area, it has been suggested that the Ephesian temple had some distinct element of grandiosity, no longer known to us—perhaps a lofty sculptured parapet or some imposing form of *podium*. The fifth temple was once more of Ionic order, but the finish and style of its details as attested by existing remains were inferior to those of its predecessor. The great sculptured drums and pedestals, now in the British Museum, belong to the lower part of certain of its columns: but nothing of its frieze or pediments (if it had any) has been recovered. Begun probably before 350 B.C., it was in building when Alexander came to Ephesus in 334 and offered to bear the cost of its completion. It was probably finished by the end of the century. It stood intact, except for very partial restorations, till A.D. 262 when it was sacked and burned by the Goths: but it appears to have been to some extent restored afterwards, and its cult no doubt survived till the Edict of Theodosius closed the pagan temples (about 389).

THE CITY

After Wood's explorations, the city remained desolate till 1894, when the Austrian Archaeological Institute obtained a concession and began systematic excavation. This has been carried down no farther than the imperial stratum. The main areas of operation have been: (1) The *Great Theatre*. The stage buildings, orchestra and lower parts of the *cavea* have been cleared. In the process considerable additions were made to Wood's find of sculptures in marble and bronze, and of inscriptions. This theatre has a peculiar interest as the scene of the tumult aroused by the mission of St. Paul; but the existing remains represent a reconstruction carried out after his time. (2) The *Hellenistic Agora*, a huge square, surrounded by porticoes, lying S.W. of the theatre and having fine public halls on the S. It has yielded fine sculpture in marble and bronze and many inscriptions. (3) The *Roman Agora*, with its large halls, lying N.W. of the theatre. Here were found many inscriptions of Roman date and some statuary. (4) A street running from the S.E. angle of the Hellenic Agora towards the Magnesian gate. This was found to be lined with pedestals of honorific statues and to have on the west side a remarkable building, stated in an inscription to have been a library. (5) A street running direct to the port from the theatre. This was known as the Arcadiane after having been restored at a higher level than formerly by the emperor Arcadius (A.D. 395). It leaves on the right the great *Thermae* of Constantine, of which the Austrians have cleared out the south-east part. Part of the quays and buildings round the port were exposed, after measures had been taken to drain the upper part of the marsh. (6) The Double Church of the Virgin "Deipara" in the N.W. of the city, wherein the council of 431 was held. Here interesting inscriptions and Byzantine architectural remains were found. Besides these excavated monuments, the Stadion; the *enceinte* of fortifications erected by Lysimachus, which runs from the tower called

the "Prison of St. Paul" and right along the crests of the Bulbul (Prion) and Panajir hills; the round monument miscalled the "Tomb of St. Luke"; and the Opistholeprian gymnasium near the Magnesian gate, are worthy of attention.

The work done by the Austrians enables a good idea to be obtained of the appearance presented by a great Graeco-Roman city of Asia in the last days of its prosperity. It may be realized better there than anywhere how much architectural splendour was concentrated in the public quarters. But the restriction of the clearance to the upper stratum of deposit has prevented the acquisition of much further knowledge. Both the Hellenistic and, still more, the original Ionian cities remain for the most part unexplored. It should, however, be added that very valuable topographical exploration has been carried out in the environs of Ephesus by members of the Austrian expedition.

The Turkish village of Ayassoluk (the modern representative of Ephesus), more than a mile N.E. of the ancient city, is noteworthy for a splendid ruined mosque built by the Seljuk, Isa Bey II., of Aidin, in 1375, which contains magnificent columns: for a castle, near which lie remains of the pendentives from the cupola of the great cathedral of St. John, now deeply buried in its own ruins; and for an aqueduct, Turkish baths and mosque-tombs.

EPHESUS, COUNCILS OF. Two church councils at Ephesus have acquired historic importance.

(*a*) In June 431 a council was convened here to deal with the Nestorian doctrine of the person of Christ. The councils of Nicea and Constantinople had asserted the full divinity and real humanity of Christ, without, however, defining the manner of their union. The attempt to solve the apparent incongruity of a perfect union of two complete and distinct natures in one person produced first Apollinarianism, which substituted the divine Logos for the human νοῦς or πνεῦμα of Jesus, thereby detracting from the completeness of his humanity; and then Nestorianism, which destroyed the unity of Christ's person by affirming that the divine Logos dwelt in the man Jesus as in a temple, and that the union of the two was in respect of dignity, and furthermore that, inasmuch as the Logos could not have been born, to call Mary θεοτόκος, "Godbearer," was absurd and blasphemous. The Alexandrians, led by Cyril, stood for the "monophysite" doctrine of the perfect union of two complete natures in one person, and made θεοτόκος the shibboleth of orthodoxy. The theological controversy was intensified by the rivalry of the two patriarchates, Alexandria and Constantinople, for the primacy of the East. As bishop of Constantinople Nestorius naturally looked to the emperor for support, while Cyril turned to Rome: but the Ephesian council of 431 condemned his doctrine and declared him excommunicate, and deposed. Cyril apparently regarded this as a declaration of the mind of the church in favour of the "monophysite" Christology.

(*b*) The so-called "Robber Synod" of Ephesus was held in 449. Eutyches, who held a form of the "monophysite" doctrine, had been deposed by his bishop, Flavianus of Constantinople, and had appealed to Dioscurus, successor of Cyril in the see of Alexandria, who restored him and moved the emperor Theodosius II. to summon a council which should "utterly destroy Nestorianism." The council, which was convened in August, 449, was entirely dominated by Dioscurus. Eutyches was acquitted of heresy and reinstated, Flavianus and other bishops deposed, the Roman legates insulted, and all opposition overborne by intimidation or actual violence. Leo I. of Rome refused to recognize the council, excommunicated Dioscurus, and demanded a new and greater council. The death of Theodosius II. removed the main support of Dioscurus, and cleared the way for the council of Chalcedon (*q.v.*), which deposed the Alexandrian and condemned Eutychianism.

See Monophysites, Nestorians and references there given, and the general histories of Dogma (especially Harnack and Loofs) and the general Church Histories on the Christological controversies of the 5th century.

EPHOD, a Hebrew word of uncertain meaning. In the post-exilic priestly writings the ephod forms part of the ceremonial dress of the high-priest (*see* Ex. xxix. 5 *seq.* and especially Eccles. xlv. 7–13). It was a richly decorated object worn outside the robe and kept in place by a girdle, and by shoulder-pieces (?), from which hung the "breastplate" (or rather pouch) containing the sacred lots, Urim and Thummim. The somewhat involved description in Ex. xxviii. 6 *sqq.*, xxxix. 2 *seq.* leaves it uncertain whether it covered the back, encircling the body like a kind of waistcoat, or only the front; at all events it was not a garment in the ordinary sense, and its association with the sacred lots indicates that the ephod was used for divination (*cf.* Num. xxvii. 21), and had become the distinguishing feature of the leading priestly line (*cf.* 1 Sam. ii. 28). From other passages it seems that the ephod had been a familiar object whose use was by no means so restricted. Like the teraphim (*q.v.*) it was part of the common stock of Hebrew cult; it is borne by persons acting in a priestly character (Samuel at Shiloh, priests of Nob, David), it is part of the worship of individuals (Gideon at Ophrah), and is found in a private shrine with a lay attendant (Judg. xvii. 5; *see*, however, vv. 10–13). Nevertheless, while the prophetical teaching came to regard the ephod as contrary to the true worship of Yahweh, the priestly doctrine of the post-exilic age has retained it.

An intricate historical problem is involved in the ephod which the priest Abiathar brought to David after the massacre of the priests of Nob. The ostensible intention is to narrate the transference of the sacred objects to David (*cf.* 2 Sam. i. 10), and henceforth he regularly inquires of Yahweh in his movements (1 Sam. xxiii. 9–12, xxx. 7 *seq.*). It is possible that the writer (or writers) desired to trace the earlier history of the ephod through the line of Eli and Abiathar to the time when the Zadokite priests gained the supremacy (*see* Levites); but elsewhere Abiathar is said to have borne the ark (1 Kings ii. 26), and this is noteworthy by reason of the confusion in the text of 1 Sam. xiv. 3, 18.

On one view, the ark in Kirjath-jearim was in non-Israelite hands (1 Sam. vii. 1 *sq.*); on the other, Saul's position as king necessitates the presumption that his sway extended over Judah and Israel. There are some fundamental divergencies in the representations of the traditions of both David and Saul (*qq.v.*), and there is indirect evidence which makes 1 Kings ii. 26 not entirely isolated. Here it must suffice to remark that the ark was also an object for ascertaining the divine will.

For the form of the earlier ephod the classic passage is 2 Sam. vi. 14, where David girt in (or with) a linen ephod dances before the ark at its entry into Jerusalem. Relying upon the known custom of performing certain observances in a practically, or even entirely, nude condition, it seems plausible to infer that the ephod was a scanty wrapping, perhaps a loin-cloth. (On the question of nudity [*cf.* 1 Sam. xix. 24] *see* Robertson Smith, *Rel. Sem.* 3 pp. 161, 450 *seq.* 687, *Ency. Bib. s.vv.* "girdle," "sack-cloth"; and M. Jastrow, *Journ. Am. Or. Soc.* xx. 144, xxi. 23.)

The favourite view that the ephod was also an image rests partly upon 1 Sam. xxi. 9, where Goliath's sword is wrapped in a cloth in the sanctuary of Nob *behind the ephod.* But it may have hung on a nail in the wall, and in any case the text is uncertain. Again, in the story of Micah's shrine parallel narratives have been used (the graven and molten images of Judg. xvii. 2–4 corresponding to the ephod and teraphim of ver. 5) and the finale refers only to the graven image of Dan (xviii. 30 *seq.*, *see* 1 Kings xii. 28 *seq.*). But the combination of ephod and teraphim (as in Hos. iii. 4) is noteworthy. Finally, according to Judg. viii. 27, Gideon made an ephod of gold and "put" it in Ophrah.

This object was probably once harmlessly associated with the cult of Yahweh (*cf.* Calf, Golden), and the term "ephod" may be due to a later hand. The passage is the only one which appears to prove that the ephod was an image.

Archaeological evidence for objects of divination and parallels from the Oriental area, can be readily cited in support of any of the above explanations of the ephod, but naturally cannot prove the form which it took in Palestine. If the ephod was a loin-cloth, its use as a receptacle and the known evolution of the article find useful analogies. Finally, if there is no decisive evidence for the view that it was an image (Judg. viii. 27), or that as a wrapping it formed the sole covering of the officiating agent (2 Sam. vi.), it can safely be said that it was used in divination and presumably did not differ radically from the ephod of post-exilic age.

See further, T. C. Foote in *Journ. Bibl. Lit.* xxi. 1902, 1 *seq.*, the articles in Hastings's *Dict. Bible* (by S. R. Driver), *Ency. Bib.* (by G. F. Moore), and *Jew. Ency.* (L. Ginsburg).

EPHOR the title of the highest magistrates of Sparta. It is uncertain when the office was created and what was its original character. We may regard it as an immemorial Dorian institution, or accept the tradition that it was founded during the first Messenian War, which necessitated a prolonged absence from Sparta on the part of both kings. The ephors seem to have had from the outset judicial or police functions. Gradually they extended their powers, aided by the jealousy between the royal houses, which made it almost impossible for the two kings to co-operate heartily.

In historical times the ephors were five in number, the first of them giving his name to the year, like the eponymous archon at Athens. Where opinions were divided the majority prevailed. The ephors were elected annually by the people; they had an official residence (*ephoreion*) in the Agora. Every full citizen was eligible.

The ephors summoned and presided over meetings of the Gerousia and Apella (*qq.v.*) and formed the executive responsible for carrying out decrees. In their dealings with the kings they represented the people. The kings swore to rule according to the laws; the ephors undertook on this condition to maintain the royal authority. They alone might remain seated in a king's presence, and had power to try and even to imprison a king. Two of them accompanied the army in the field, not interfering with the king's conduct of the campaign, but prepared, if need be, to bring him to trial on his return. The ephors shared the criminal jurisdiction of the Gerousia and decided civil suits. The administration of taxation, the distribution of booty, and the regulation of the calendar devolved upon them. They were responsible for protecting the State against the helots, upon whom they formally declared war on entering office, so as to be able to kill any whom they regarded as dangerous without violating religious scruples. The ephors were supreme in questions of foreign policy. They enforced, when necessary, the alien acts (*xenēlasia*), negotiated with foreign ambassadors, instructed generals and sent out expeditions.

EPHORUS (*c.* 400–330 B.C.), of Cyme in Aeolis, in Asia Minor, Greek historian. The tradition that, together with Theopompus, he was the pupil of Isocrates, and turned to the study of history at the suggestion of his master, seems to be unhistorical. His chief works were Ἱστορίαι in 29 books, the first universal history, beginning with the return of the Heracleidae to Peloponnesus. The work was edited by his son Demophilus, who added a 30th book, containing a summary description of the Social War and ending with the taking of Perinthus (340) by Philip of Macedon (*cf.* Diod. Sic. xvi. 14 with xvi. 76). Ephorus was the first historian to divide his work into books, to each of which he wrote a preface. He treated his material κατὰ γένος (according to subject), and not according to years. Ephorus was used as a source by Diodorus, who makes chronological blunders in trying to reproduce him in annalistic form. Polybius (xii. 25 g), while crediting him with a knowledge of naval warfare conditions, ridicules his description of the battles of Leuctra and Mantineia as showing ignorance of the nature of land operations. He usually (though not always) distinguished clearly between the mythical and historical (Strabo ix. p. 423); he even recognized that detail, though it corroborates accounts of recent events, is ground for suspicion in reports of far-distant history. His style was artificial, and he frequently sacrificed truth to rhetoric effect. Other works attributed to him were:—*A Treatise on Discoveries; Respecting Good and Evil Things; On Remarkable Things in Various Countries* (it is doubtful whether these were separate works, or merely extracts from the *Histories*); *A Treatise on my Country*, on the history and antiquities of Cyme, and an essay *On Style*. It has also been maintained (*e.g.*, by Judeich, E. M. Walker) that he is the author of a historical fragment discovered at Oxyrhynchus. *See* E. M. Walker, *Hellenica Oxyrhynchia* (1913).

Fragments in C. W. Müller, *Fragmenta historicorum Graecorum*, i., with critical introduction on the life and writings of Ephorus; *see* J. A. Klügmann, *De Ephoro historico* (1860); C. A. EPHRAEM SYRUS (Ephraim the Syrian) (d. 373), a saint famous as a poet and commentator, was born early in the 4th century at or near Nisibis, of pagan parents. He became a ward of St. James, the famous bishop of Nisibis, was baptized and probably ordained a deacon. During the war begun by Shapur II., in which the city was thrice unsuccessfully besieged by the Persians (in 338, 346 and 350), Ephraem played an important part. When Nisibis surrendered in 363, he left with other Christians, and finally settled at Edessa where he devoted himself to writing, teaching and refuting heresies. He died there probably on June 9, 373. There is no ground for the statements that he spent eight years in Egypt refuting Arianism and that he wrote the funeral panegyric on Basil, though he might well have known Basil.

Of Ephraem's many works, written in Syriac, numerous early versions in Greek, Armenian, Coptic, Aratic and Ethiopic are still extant. They include commentaries on the Scriptures, homilies and hymns. Except for the commentaries on Genesis and on a large portion of Exodus, his O.T. commentaries are accessible only in the form they had assumed in the *Catena Patrum* of Severus (compiled in 861), and in quotations by later Syriac commentators. His commentary on the Gospels is of great importance in connection with N.T. textual history, for the text on which it was based was that of the Diatessaron. Only the ancient Armenian version survives, and was published at Venice in 1836 with the commentary on the Pauline epistles (also only extant in Armenian) and other works. A Latin version of the Armenian Diatessaron commentary was made by Aucher and Mösinger (Venice, 1876). His homilies are expository, controversial and hortatory. His hymns, which greatly impressed his countrymen, deal with such subjects as the Nativity, the Epiphany, Paradise, free-will and hymns against heretics and against sceptics. Of the 72 hymns known as *Carmina Nisibena*, the first 20 were written at Nisibis between 350 and 363 during the Persian invasions and the remaining 52 at Edessa between 363 and 373. The former tell us much of the incidents of the frontier war.

Ephraem had an immense reputation for sanctity. As an exegete he inclined strongly towards the Antiochene school; as a theologian he defended Nicaean orthodoxy and regarded it as his special task to combat the views of Marcion, Bardaison and Mani. His poetry, though prolix and wearisome, possesses a certain richness of diction and skill in the use of metaphors and illustrations.

A full list of the many editions of Ephraem's works is given in Herzog's *Realencyklopädie*. The most important are:—(1) the folio edition in 6 vols. (3 of works in Greek and 3 in Syriac) containing a Latin version (Rome, 1732–46); (2) The *Commentary on Acts* ed. F. C. Conybeare (1926); (3) the Prose Refutations of Mani, Marcion and Bardaisan ed. C. W. Mitchell, 2 vols. (1912–21); (4) *Carmina Nisibena*, ed. with a Latin trans. by G. Bickell (Leipzig, 1866); (5) *Hymni et Sermones*, ed. with a Latin trans. by T. J. Lamy (4 vols., Malines, 1882–1902). Many selected homilies have been edited or translated (*cf.* Wright, *Syriac Literature*, 1894); a selection of the *Hymns* was translated by H. Burgess, *Select Metrical Hymns of Ephraem Syrus* (1853); further selections in Pusey's *Library of the Fathers*, and in *The Library of Nicene and Post-Nicene Fathers*. See J. R. Harris, *Fragments of the Commentary of Ephraem Syrus upon the Diatessaron* (1895); F. C. Burkitt, "Ephraim's Quotations from the Gospels" in *Texts and Studies*, vol. 7 (Cambridge, 1901); and C. Emereau, *S. Ephrem le Syrien, Son oeuvre Litt. Grecque* (1919).

EPHRAIM, the stronger of the two tribes into which the house of Joseph was divided (*cf.* Gen. xlviii. 8–16). The territorial boundary between the two in west Palestine (east of Jordan we find Manasseh alone) seems to have been uncertain, but Ephraim included the famous sites of Shechem, Shiloh, Timnath-Heres and Samaria, while Bethel belonged to the allied tribe of Benjamin.

During the period of the monarchy, Ephraim was so much the dominant tribe in the northern kingdom, that its name is sometimes used as synonymous with Israel. Its early settlements were made in the central hill country, and the tribe may have owed its superior position to the comparative purity of its descent from the Aramaean invaders to whom Israel traced their ancestry.

EPHTHALITES or **WHITE HUNS.** This many-named and enigmatical tribe was of considerable importance in the history of India and Persia in the 5th and 6th centuries, and was known to the Byzantine writers, who call them 'Εφθαλῖται, Εὐθαγῖται, Νεφθαλῖται, or 'Αβδελοί. The last of these is an independent attempt to render the original name, which was probably something like Aptal or Haptal, but the initial N of the third is believed to be a clerical error. They were also called Λευκοί, Οὖννοι or Χοῦνοι, White (that is fair-skinned) Huns. Ephthalite is the usual orthography, but Hephthalite is perhaps more correct.

Our earliest information about the Ephthalites comes from the Chinese chronicles, in which it is stated that they were originally a tribe of the great Yue-Chi (*q.v.*), living to the north of the Great Wall, and in subjection to the Jwen-Jwen, as were also the Turks at one time. Their original name was Hoa or Hoa-tun. Before the 5th century A.D. they began to move westwards, for about 420 we find them in Transoxiana and for the next 130 years they were a menace to Persia, which they continually and successfully invaded, though they never held it as a conquest. The Sassanid king, Bahram V., fought several campaigns with them and succeeded in keeping them at bay, but they defeated and killed Peroz (Firūz), A.D. 484. The Persians were not quit of the Ephthalites until 557, when Chosroes Anushirwan destroyed their power with the assistance of the Turks.

The Huns who invaded India appear to have belonged to the same stock as those who molested Persia. The headquarters of the horde were at Bamian and at Balkh, and from these points they raided south-east and south-west. Skandagupta repelled an invasion in 455, but the defeat of the Persians in 484 probably stimulated their activity, and at the end of the 5th century their chief Toromana penetrated to Malwa in central India and succeeded in holding it for some time. His son Mihiragula (*c.* 510–540) made Sakāla in the Punjab his Indian capital, but the cruelty of his rule provoked the Indian princes to form a confederation and revolt against him about 528. He took refuge in Kashmir, where after a few years he seized the throne. He died (*c.* 540), and shortly afterwards the Ephthalites collapsed under the attacks of the Turks. They were probably gradually absorbed in the surrounding populations. Their political power perhaps continued in the Gurjara empire, which at one time extended to Bengal in the east and the Nerbudda in the south, and continued in a diminished form until A.D. 1040. These Gurjaras appear to have entered India in connection with the Hunnish invasions.

Our knowledge of the Indian Hūnas is chiefly derived from coins, from a few inscriptions distributed from the Punjab to central India, and from the account of the Chinese pilgrim Hsüan Tsang, who visited the country just a century after the death of Mihiragula. The Greek monk Cosmas Indicopleustes, who visited India about 530, describes the ruler, Gollas, as a White Hun king.

The accounts of the Ephthalites, especially those of the Indian Hūnas, dwell on their ferocity and cruelty. Their invasions shook Indian society and institutions to the foundations, but unlike the earlier Kushans, they do not seem to have introduced new ideas into India nor have acted as other than a destructive force. Many of Mihiragula's coins bear the Nandi bull (Śiva's emblem); and the king's name is preceded by the title *śahi* (shah), which had previously been used by the Kushan dynasty. Toramana's coins are found plentifully in Kashmir, which, therefore, probably formed part of the Hūna dominions before Mihiragula's time.

Greek writers give a more flattering account of the Ephthalites; Procopius says they were far more civilized than the Huns of Attila. The Chinese writers say their customs were like those of the Turks; that they had no cities, lived in felt tents, were ignorant of writing, and practised polyandry. Nothing whatever is known of their language, but some scholars explain the names Toramana and Jauvla as Turkish.

For the possible connection between the Ephthalites and the European Huns *see* HUNS.

See (original authorities) Procopius, Menander Protector, Cosmas, Indicopleustes (trans. McCrindle, Hakluyt Society, 1897); the Kashmir chronicle, *Rajatarangini* (trans. Stein, 1900, and Yüan Chwang).

Franke, *Beiträge aus chinesischen Quellen zur Kenntnis der Türkvölker und Skythen* (1904); A. Stein, *White Huns and Kindred Tribes* (1905); articles by Vincent Smith, Specht, Drouin, and E. H. Parker in the *Journal of the Royal Asiatic Society, Journal asiatique, Revue numismatique, Asiatic Quarterly*, etc.

EPI, the French architectural term for a small finial (*q.v.*), generally of metal, but sometimes of terra-cotta, forming the termination of a spire or the angle of a roof.

EPICENE, a term in Greek and Latin grammar denoting nouns possessing one gender only, but used to describe animals of either sex. In English grammar there are no true epicene nouns, but the term is sometimes used instead of *common gender.* "Epicene" is sometimes also applied as an adjective to persons having the characteristics of both sexes, and hence is occasionally used as a synonym of "effeminate."

EPICHARMUS (*c.* 540–450 B.C.), Greek comic poet, was born in Cos. Early in life he went to Megara in Sicily, and after its destruction by Gelon (484) removed to Syracuse, where he lived at the court of Hieron till his death at the age of 90 or (according to a statement in Lucian, *Macrobii,* 25) 97. The inhabitants set up a statue in his honour with an inscription by Theocritus (*Epigr.* 17). Epicharmus was the chief representative of the Sicilian or Dorian comedy. Of his works 35 titles and a few fragments have survived. In the city of tyrants it would have been dangerous to present political comedies, like those of Aristophanes at Athens; Epicharmus' plays, therefore, are either mythological travesties (resembling the satyric drama of Athens) or character comedies. To the first class belong the *Busiris,* in which Heracles appears as a voracious glutton; the *Marriage of Hebe,* remarkable for a long list of dainties. The second class dealt with different classes of the population (the sailor, the prophet, the boor, the parasite). Some of the plays seem to have bordered on the political, as *The Plunderings,* describing the devastation of Sicily in the time of the poet. A short fragment has been discovered (in the Rainer papyri) from the 'Οδυσσεὺς αὐτόμολος, which told how Odysseus entered Troy disguised as a beggar and obtained valuable information. Another feature of his works was the large number of sentiments expressed in proverbial form; the Pythagoreans claimed him as a member of their school. The metres employed by Epicharmus were iambic trimeter, and especially trochaic and anapaestic tetrameter.

Epicharmus is the subject of articles in Suidas and Diogenes Laërtius (viii. 3). *See* A. O. Lorenz, *Leben und Schriften des Koers E.* (with account of the Doric drama and fragments, 1864); J. Girard, *Études sur la poesie grecque* (1884); Kaibel in Pauly-Wissowa's *Realencyklopädie,* according to whom Epicharmus was a Siceliot; for the papyrus fragment, Blass in *Jahrbücher für Philologie,* cxxxix., 1889.

EPIC POETRY or **EPOS,** the names given to the most dignified and elaborate forms of narrative poetry. The word *épopée* is used. When we first discover the epos in Greek literature, hexameter verse has already been selected for its vehicle. In this form epic poems were composed not merely dealing with war and personal romance, but with a didactic or religious purpose. The early epic poets, Lesches, Linus, Orpheus, Arctinus, Eugammon, are the veriest shadows, whose names often betray their symbolic and fabulous character. The *Iliad* and the *Odyssey* (*see* HOMER) form for us the type of the ancient epic; when we speak of epic poetry, we unconsciously measure it by the example of the *Iliad* and the *Odyssey.* It is quite certain, however, that these poems had not merely been preceded by a vast number of revi-

sions of the mythical history of the country, but were accompanied by innumerable poems of a similar character. When we pass from Homer and Hesiod, about whose actual existence critics will be eternally divided, we reach in the 7th century a poet, Peisander of Rhodes, who wrote an epic poem, the *Heracleia,* of which fragments remain. Other epic writers, who appear to be historic, are Antimachus of Colophon, who wrote a *Thebais,* Panyasis, who, like Peisander, celebrated the feats of Heracles; Choerilus of Samos; and Anyte, of whom we only know that she was an epic poetess, and was called "The female Homer." In the 6th and 5th centuries B.C. there was a school of philosophical epic, Xenophanes, Parmenides and Empedocles being the leaders.

From the dawn of Latin literature epic poetry seems to have been cultivated in Italy. A Greek exile, named Livius Andronicus, translated the *Odyssey* into Latin during the first Punic War, but the earliest original epic of Rome was the lost *Bellum Punicum* of Naevius, a work to which Virgil was indebted. A little later, Ennius composed, about 172 B.C., in 18 books, an historical epic of the *Annales*, dealing with the whole chronicle of Rome. Virgil began the most famous of Roman epics in the year 30 B.C., and when he died, nine years later, he desired that the ms. of the *Aeneid* should be burned, as it required three years' work to complete it. In the next generation, the *Pharsalia* of Lucan, of which Cato, as the type of the republican spirit, is the hero, was the principal example of Latin epic. Statius, under the Flavian emperors, wrote several epic poems, of which the *Thebaid* survives. In the 1st century A.D. Valerius Flaccus wrote the *Argonautica* in eight books, and Silius Italicus the *Punic War,* in 17 books; these authors show a great decline in taste and merit. At the close of the 4th century the style revived with Claudian, who wrote the *Rape of Proserpine.* With Claudian the history of epic poetry among the ancients closes.

In mediaeval times there existed a large body of narrative poetry to which the general title of Epic has usually been given. Three principal schools are recognized, the French, the Teutonic and the Icelandic. Teutonic epic poetry deals, as a rule, with legends founded on the history of Germany in the 4th, 5th and 6th centuries, and in particular with such heroes as Ermanaric, Attila and Theodoric. But there is also an important group in it which deals with English themes, and among these *Beowulf, Waldere, The Lay of Maldon* and *Finnesburh* are pre-eminent. To this group is allied the purely German poem of *Hildebrand,* attributed to *c.* 800. Among these *Beowulf* is the only one which exists in anything like complete form, and it is of all examples of Teutonic epic the most important. It is written, like all old Teutonic work of the kind, in alliterative unrhymed rhythm.

The surviving epical fragments of Icelandic composition are found thrown together in the *Codex Regius,* under the title of *The Elder Edda* (*see* EDDA), a most precious ms. discovered in the 17th century. The French mediaeval epics (*see* CHANSONS DE GESTE) are late in comparison with those of England, Germany and Iceland. They form a curious transitional link between primitive and modern poetry; the literature of civilized Europe may be said to begin with them. The existing masterpiece of this kind is the magnificent *Roland.* Of the progress and decline of the *chansons de geste* a fuller account is given elsewhere. To the *Nibelungenlied* (*q.v.*) also, detailed attention is given in a separate article.

What may be called the artificial or secondary epics of modern Europe, founded upon an imitation of the *Iliad* and the *Aeneid,* are more numerous than the ordinary reader supposes, although but few of them have preserved much vitality. In Italy the *Chanson de Roland* inspired romantic epics by Luigi Pulci (1432–87), whose *Morgante Maggiore* appeared in 1481, and is a masterpiece of burlesque; by M. M. Boiardo (1434–94), whose *Orlando Innamorato* was finished in 1486; by Francesco Bello (1440?–95), whose *Mambriano* was published in 1497; by Lodovico Ariosto (*q.v.*), whose *Orlando Furioso,* by far the greatest of its class, was published in 1516, and by Luigi Dolce (1508–68), as well as by a great number of less illustrious poets. The most splendid of all the epics of Italy, however, was, and remains, the *Jerusalem Delivered* of Torquato Tasso (*q.v.*). Early Portuguese literature is rich in epic poems; but all others are obscured by the glory of Camoens (*q.v.*), whose magnificent *Lusiads* had been printed in 1572, and forms the summit of Portuguese literature. In Spanish poetry, the *Poem of the Cid* takes the first place, as the great national epic of the middle ages; it is supposed to have been written between 1135 and 1175. Perhaps the finest modern epic in Spanish verse, is the *Araucana* (1569–90) of Alonso de Ercilla y Zúñiga (1533–95), "the first literary work of merit," as Fitzmaurice-Kelly remarks, "composed in either American continent." In France, the epic never flourished in modern times, and no real success attended even the *Henriade* of Voltaire. In English literature *The Faery Queen* of Spenser has the same claim as the Italian poems mentioned above to bear the name of epic, and Milton, who stands entirely apart, may be said, by his isolated *Paradise Lost,* to take rank with Homer and Virgil.

See Bossu, *Traité du poeme épique* (1675); Voltaire, *Sur la poésie épique;* Fauviel, *L'Origine de l'épopée chevaleresque* (1832); Léon Gautier, *Les Épopées françaises* (1865–68); W. von Christ, *Geschichte der griechischen Litteratur* (1879); Gaston Paris, *La Littérature française au moyen âge* (1890); W. P. Ker, *Epic and Romance* (1897), and *Essays in Mediaeval Literature* (1905); Gilbert Murray, *The Rise of the Greek Epic* (3rd ed. 1924). For works on the Greek epics *see* also GREEK LITERATURE and HOMERIC POEMS.

EPICTETUS (born *c.* A.D. 60), Greek philosopher, probably from Hierapolis, Phrygia. The name Epictetus is the Greek for "acquired" (from ἐπικτᾶσθαι); his original name is not known. As a boy he was a slave, but managed to attend the lectures of the Stoic Musonius Rufus, and subsequently became a freedman. He was lame and of weakly health. In 90 he was expelled with other philosophers by Domitian, who was irritated by the encouragement which the opposition to his tyranny found amongst the adherents of Stoicism. The rest of his life he spent at Nicopolis, in southern Epirus, not far from the scene of the battle of Actium. He wrote nothing; but much of his teaching was transmitted by his pupil Flavius Arrianus, the historian of Alexander the Great, in two treatises, four books of the larger, *Discourses of Epictetus* (Ἐπικτήτου Διατριβαί), being still extant. The other, the *Encheiridion* ("Handbook"), contains in an aphoristic form the main doctrines of the longer work.

The philosophy of Epictetus exhibits a high idealistic type of morality. The all important problem is how life is to be carried out well. True education lies in recognizing that there is only one thing which is fully our own,—that is, our will or purpose. God, acting as a good king and father, has given us a will which cannot be compelled or thwarted by anything external. We are not responsible for the ideas that present themselves to our consciousness, but we are absolutely responsible for the way in which we use them. "Two maxims," he says, "we must ever bear in mind—that apart from the will there is nothing good or bad, and that we must not try to anticipate or direct events, but merely to accept them with intelligence." We must, in short, believe that there is a God whose thought directs the universe.

Man is a member of a great system, which comprehends God and men. Each human being is firstly a citizen of his own commonwealth; but he is also a member of the great city of gods and men, whereof the city political is only a copy. All men are the sons of God, by virtue of rationality, and, kindred in nature with the divinity. Hence man can enter into the method of divine administration, and thus can learn—and it is the acme of his learning—the will of God, which is the will of nature. The natural instinct of animated life, to which man also is subject, is self-preservation and self-interest. But men are so constituted that the individual cannot secure his own interests unless he contributes to the common welfare. The aim of the philosopher therefore is to see the world as a whole, to grow into the mind of God and to make the will of nature our own.

The historical models to which Epictetus reverts are Diogenes and Socrates. But he frequently describes an ideal character of a missionary sage, perfectly unembarrassed in the service of God, not bound by the common ties of life, nor entangled by relationships.

The best editions of the works of Epictetus are by J. Schweig-

häuser (6 vols., Leipzig, 1799–1800) and H. Schenkl (Leipzig, 1894, 1898). An edition with an Eng. trs. by W. A. Oldfather in Loeb series (1926, Eng. trs. also by G. Long, 1848). *See* A. Bonhöffer, *Epiktet und die Stoa* (Stuttgart, 1890), *Die Ethik des Stoikers Epiktet* (1894) and *Epictetus u. das Neue Testament* (1911); E. M. Schranka, *Der Stoiker Epiktet und seine Philosophie* (Frankfort, 1885); T. Zahn, *Der Stoiker Epiktet und sein Verhältnis zum Christentum* (2nd ed. Erlangen, 1895); T. Colardeau, *Étude sur Épictète* (1903), and D. S. Sharp, *Epictetus and the New Testament* (1914). *See* also STOICS and Überweg, *Grund. der Gesch. der Phil.* pt. 1 (1926) for full bibliography.

EPICURUS (341–270 B.C.), Greek philosopher, was born in Samos, where his father, Neocles, an Athenian, had settled some ten years before. In 323 he came to Athens, but shortly after joined his father in Colophon (Diog. Laert., x. 1). Thereafter he taught in Mytilene and Lampsacus and in 306 returned to Athens, where he founded a school and established his permanent home. He taught and lived with his pupils near the Dipylon in a garden (κῆπος, Diog. Laert., x. 17, *Epicuri hortus,* Cic. *N.D.* i. 33; hence Cic. *N.D.* 43 Democritus . . . from whose waters Epicurus irrigated his gardens) which at his death he bequeathed to his school (*cf.* his will in Diog. Laert., x. 27). The society which he gathered round him included women as well as men, a circumstance which occasioned some scandalous legends. A more pleasant story is told of his unsurpassed kindness to all, as testified by his country and his friends (Diog. Laert., x. 9), and of the simplicity which characterized the regimen of his school (Diog. Laert. x. 11).

Writings.—Epicurus was a most prolific writer—πολυγραφώτατος Diog. Laert., x. 26, who there gives a list of his chief works. Diogenes has preserved three letters which give the gist of his teaching: (1) *To Herodotus,* dealing with physics; (2) *To Pythocles,* on meteorology; (3) *To Menoeceus,* on ethics and theology. Diogenes has further preserved his Κύριαι Δόξαι (Cic. *De Fin.*, ii. 7, 20 Epicuri Κυρίας Δόξας id est quasi maxime ratas. *id. N.D.* i. 30, 85 illis. selectis eius brevibusque sententiis, quas appellatis Κυρίας Δόξας *cf.* Plut. *adv. Coloten* 31 τῶν κυριωτάτων δοξῶν Lucian *Alexandr.* 47 Diod. xxv. *fr.* 1. Philodem. *de Ira,* col. xliii., etc.), a series of 40 short aphoristic statements of Epicurean doctrines. Some fragments of his great work Περὶ φύσεως (in 37 books) as well as of other writings are preserved in the rolls of Herculaneum. A series of 80 Epicurean aphorisms, partly identical with the Κύριαι Δόξαι, were discovered (1888) in a Vatican ms. (cod. Vat. gr. 1950) of the 14th century. In 1884 and subsequent years were discovered considerable fragments of letters and aphorisms of Epicurus, which Diogenes (2nd–3rd century A.D.) of Oenoanda in Lycia had caused to be inscribed on the wall of a portico for the instruction of his fellow citizens. Knowledge of Epicurus is further supplemented by quotations or references in later authors—Plutarch, Cicero, etc., and, above all, Lucretius, whose great poem *De Rerum Natura* is a passionate exposition of the teaching of Epicurus.

The philosophic outlook of Epicurus is fundamentally ethical and his interest in other studies seems to have been small (*cf.* Diog. Laert., x. 2; 6; 31.). Even his interest in physics is purely subsidiary to the ethical end, *i.e.*, to obtaining a theory of life which shall ensure "quietude of mind and a steadfast faith" (ἀταραξίαν καὶ πίστιν βέβαιον Diog. Laert., x. 85). According to Diog. Laert., x. 29 his philosophy is divided into three parts: *canonical, physical, ethical*; the first, dealing with "approaches (ἐφόδους) to the study," *i.e.*, with *criteria* of validity, being usually coupled with the physical.

Physics.—We are told by Diog. Laert., x. 2, that it was from the writings of Democritus that Epicurus received his first impulse to philosophy. Be that as it may, the doctrine of Democritus regarding the atoms and the void is the basis of the teaching of Epicurus.

Nothing is created out of nothing and nothing passes into nothing. The universe (τὸ πᾶν) was always such as it is now and always will be such, since there is nothing beyond the universe the entrance of which could effect a change. The universe consists of bodies (σώματα) and space (τόπος = τὸ κενόν, the void). The existence of bodies is testified by sense (αἴσθησις) and the existence of space is a necessary inference of reason (λογισμός); for, if the void did not exist, bodies could not move as, in fact, sense assures us that they do move. Besides these two—bodies and space—nothing can even be imagined. Again, bodies are either compound or the elements of which bodies are compounded. These elements are indivisible (ἄτομα, atoms) and unchangeable; for, when a compound is resolved into its elements, the elements must either pass into nothingness—which we held to be impossible—or remain as ultimate indissoluble entities. Again the universe is infinite; for the finite has an extremity (ἄκρον) which can only be observed against something else, which is *ex. hypothesi* impossible in the case of the universe. Having, then, no extremity it has no limit (πέρας). Also the number of atoms and the extent of the void are infinite; for if there were a limited number of atoms in unlimited void, the atoms could not remain anywhere but would drift, scattered through infinite void, not having atoms to support and place them by their collisions (ἀνακοπαί Diog. Laert., x. 42). If on the other hand the void were limited and the atoms unlimited, there would not be room for them.

The atoms are not all of one shape (σχῆμα). The number of atoms of any one shape is absolutely infinite (ἁπλῶς ἄπειροι), but the number of different shapes, though incomprehensibly large, is not absolutely infinite (οὐχ ἁπλῶς ἄπειροι ἀλλὰ μόνον ἀπερίληπτοι).

The atoms vary in size but are not of all sizes: otherwise some would be visible. Whatever their size, they are in perpetual motion, moving all with the same velocity, swift as thought (ἅμα νοήματι Diog. Laert., x. 61). Owing to an inherent "swerve" (παρέγκλισις, *clinamen,* Lucret., ii. 292—this, of course, is a necessary postulate, Lucret., ii. 243 Quare etiam atque etiam paulum inclinare necesse est Corpora. Plut. *Mor.* 964 C οὐδὲ γὰρ αὐτοὶ τῷ Ἐπικούρῳ διδόασιν . . . ἄτομον παρεγκλῖναι μίαν ἐπὶ τοὐλάχιστον) the atoms collide and rebound to a lesser or greater distance, thus forming compound bodies of greater or lesser density.

Psychology.—(1) The soul is a material body of fine parts (σῶμα λεπτομερές) and is distributed through the whole bodily structure. Compound bodies are of two sorts—those which are capable of holding together of themselves and those which cannot do so unless protected (στεγαζόμενα) by some more solid body. The soul belongs to the latter sort. So long as it is protected by the body, it is capable of sensation and of communicating sensation to the body. When it leaves the body, it is dissipated; the body, on the other hand, is no longer capable of sensation. (2) Sense-perception is a purely material process. From the surface of all bodies there are continually being discharged images (εἴδωλα Diog. Laert., x. 46, *simulacra* Lucret., iv. 99, *imagines* Lucret., iv. 101), hollow films (Diog. Laert., *l.c.* κοιλώματα) of exceedingly fine texture, which in shape are an exact replica of the body (τύποι ὁμοσχήμονες τοῖς στερεμνίοις Diog. *l.c.*). These, reaching the soul through the various organs of sense, originate sensation. (3) Sensation is the sole source of knowledge and all sensuous perceptions are true. Error can arise only when, beyond what is given in sensation, the mind forms an opinion which is afterwards contradicted or unconfirmed (Diog. Laert., x. 50. *cf. ibid.* 32; 146 f.).

According to Diog. Laert., x. 31 "In the *Canon* Epicurus says that the *criteria* of truth are the sensations (αἰσθήσεις) and concepts (προλήψεις) and the feelings" (πάθη); the Epicureans add "the imaginative apprehensions of the mind" (τὰς φανταστικὰς ἐπιβολὰς τῆς διανοίας). This passage, which should be compared with several passages in the *Letter to Herodotus* (Diog. Laert., x. 38; 50; 51; 62) and with K. Δ. xxiv. (Diog. Laert., x. 147), raises some difficulties. By sensations is meant that which is immediately given by the senses. By concepts is meant the general notion (*notities,* Lucret., v. 182; *anticipatio sive praenotio,* Cic. *N.D.* i. 17.43) formed by repeated sense-perceptions: Diog. Laert., x. 33 τὴν δὲ πρόληψιν λέγουσιν . . . καθολικὴν νόησιν ἐναποκειμένην, τουτέστι μνήμην τοῦ πολλάκις ἔξωθεν φανέντος, *cf. ibid.* 31; 72; 152 f., and especially 124, where we are told that "the assertions of the many about the gods are not conceptions (προλήψεις) but false suppositions (ὑπολήψεις ψευδεῖς)." By the retention of these in the mind we are able, not merely to perceive

an individual object as such, but to refer it to the general name. By feelings are meant apparently the "emotions," or, so to say, passive effects on the mind. Lastly the φανταστικὴ ἐπιβολὴ τῆς διανοίας seems best referred to the power of the mind to form mental images (φαντασίαι) intuitively. It would thus be equivalent to the ἐναργὴς γνῶσις by which the gods are known (*Letter to Menoeceus*, 123). The best commentary on the whole matter is K. Δ. xxiv. (Diog. Laert., x. 147), "If you reject any sensation absolutely and do not distinguish opinion in regard to that which awaits confirmation (τὸ δοξαζόμενον κατὰ τὸ προσμένον from that which is already given (τὸ παρόν) by sensation and feelings and every imaginative apprehension of the mind, you will confound all other sensations as well and so reject every criterion."

Ethics.—The criterion of good and evil is sensation: πᾶν ἀγαθὸν καὶ κακὸν ἐν αἰσθήσει (*Letter to Menoec.*, 124). Hence "we declare pleasure to be the beginning and end of the blessed life; for we recognize this to be our first and natural good, and from this we start in every choice and avoidance and this we make our goal, using feeling as the canon by which we judge every good" (*ibid.* 129). "But while every pleasure is in itself good, not all pleasures are to be chosen, since certain pleasures are produced by means which entail annoyances many times greater than the pleasures (K. Δ. viii.). Moreover, a right conception of pleasure itself conduces to right living, since it is not possible to live pleasantly without living wisely and well and righteously" (K. Δ. v.). In this light the declaration that "beauty, virtue, and the like are to be valued if they produce pleasure; if not, we must bid them farewell" (*ap.* Athen. 546 f.) is not so hedonistic as it sounds. Pleasure as contemplated by Epicurus is not so much active enjoyment as the absence of pain: Diog. Laert., x. 136 "Epicurus differs from the Cyrenaics as regards Pleasure; for they do not admit static (καταστηματικήν) but only active (τὴν ἐν κινήσει) Pleasure . . . But Epicurus in his work on *Choice* says: Quiet of mind (ἀταραξία) and absence of (bodily) pain (ἀπονία) are static pleasures, but joy and mirth are seen in activity" (*cf.* Plut. *Mor.* 1089 D).

The Gods.—Since happiness lies in quiet of mind (ἀταραξία Diog. Laert., x. 82; 85; 128 "all choice and avoidance are to be referred to health of body and quiet of mind, since this is the end of the blessed life") Epicurus is concerned to remove the two great disturbing ideas in human life—the fear of the gods and the fear of death (*Letter to Herod*, 81). He does not deny the existence of the gods—"their existence is known to us by immediate apprehension" (*Letter to Menoec.* 123, θεοὶ μὲν γὰρ εἰσίν ἐναργὴς γὰρ αὐτῶν ἐστιν ἡ γνῶσις.): only they are not such as is vulgarly supposed. Fashioned of finer stuff than we, they dwell afar in the intermundial spaces (μετακόσμια Plut. *Mor.* 731 D, 734 C, *intermundia* Cic. *N.D.* i. 8. The lucid interspace of world and world, Tennyson, *Lucretius*), neither troubling nor troubled by the affairs of humanity, neither rewarding virtue nor punishing sin in this life. And, as we have seen above, there is no life to come, since the soul is of such a nature that, when it leaves the body, it is immediately dissolved into the primordial atoms of which it was compounded.

The Epicurean School.—The Epicurean school survived until the 4th century A.D. Among his immediate disciples the most eminent were Metrodorus, Hermarchus, who succeeded Epicurus as head of the school, Colotes (*cf.* Plut. *adv. Coloten*=*Mor.* 1107 D.—1127 E). Later prominent Epicureans were Apollodorus (called κηποτύραννος King of the Garden, Diog. Laert., x. 25) in the second half of 2nd century B.C.; Zenon of Sidon (b. *c.* 150 B.C.), teacher of Cicero; and his pupil, Philodemus of Gadara, of whose works some fragments have been recovered from Herculanean rolls. His most eminent Roman disciple was, of course, Lucretius.

EPICYCLE, in ancient astronomy, a small circle the centre of which describes a larger circle. It was especially used to represent geometrically the periodic apparent retrograde motion of the outer planets, Mars, Jupiter, and Saturn, which we now know to be due to the annual revolution of the earth around the sun.

EPICYCLOID: *see* CURVES, SPECIAL.

EPIDAURUS, the name of two ancient cities of southern Greece.

1. Epidaurus the Holy, a maritime city on the eastern coast of Argolis, on a rocky peninsula with a natural harbour on the northern side and an open bay on the southern. Its narrow but fertile plain is shut in except towards the sea by mountains, of which the most notable were Arachnaeon and Titthion. The conterminous states were Corinth, Argos, Troezen and Hermione. The commercial advantages of its position, and the fame of its temple of Asclepius made Epidaurus a place of some importance. It was occupied by a Carian colony, by Ionians and by Phlegyans from Thessaly. The Ionians were conquered by Dorians of Argos led by Deiphontes; and the city preserved its Dorian character. It colonized neighbouring islands, founded Aegina and took part with Argos and Troezen in settlements in Asia Minor. The monarchical government gave way to oligarchy, and oligarchy to a despotism. When Procles the tyrant was captured by Periander of Corinth, oligarchy was restored, and Epidaurus continued a close ally of Sparta. The governing body of 180 was chosen from certain influential families, and the executive was a committee of *artynae* (from ἀρτύνειν, to manage). The rural population, who had no share in the affairs of the city, were called κονίποδες ("dusty-feet"). The site of a temple of Hera is identified with the chapel of St. Nicolas; portions of the walls can be traced; and the name is preserved by the little village of Nea-Epidavros.

The *Hieron* (sacred precinct) of Asclepius, about 8 m. inland from the town, has been excavated by the Greek Archaeological Society. In addition to the sacred precinct, with its temples and other buildings, the theatre and stadium have been cleared; and baths, gymnasia and a hospital have been found. The sacred road from Epidaurus, flanked by tombs, approaches through a gateway. The chief buildings are grouped together, and include temples of Asclepius and Artemis, the Tholos, and the Abaton (portico), where the patients slept. Architecture and sculpture are of high merit, and inscriptions record cures attributed to the god.

The temple of Asclepius, which contained the gold and ivory statue by Thrasymedes of Paros, had six columns at the ends and eleven at the sides; it was approached by a ramp at the eastern front. An inscription records contracts for building this temple about 460 B.C. The sculptor Timotheus (who collaborated in the Mausoleum) undertook to make the acroteria, Nereids mounted on sea-horses, on the pediments, and models for the sculpture, some of which has been found. The great altar lay to the south of the temple, and beyond it a small temple of Artemis and a square Roman building. The Tholos, to the south-west of the temple of Asclepius, must have been one of the most beautiful buildings in Greece; the exquisite carving is only equalled by that of the Erechtheum at Athens. It consisted of a circular chamber, with Doric colonnade outside and Corinthian within: the architect was Polyclitus, probably the younger sculptor of that name. In contracts for its building it is called the Thymele; it was probably the idealized architectural representative of a primitive pit of sacrifice, such as may still be seen in the Asclepianum at Athens. The foundations consist of a series of concentric walls with doors and partitions that make a subterranean labyrinth. There is no evidence of a well or spring. North of the Tholos is the long portico described in inscriptions as the Abaton; on two different levels, the lower of which had two storeys. Here the invalids used to sleep when consulting the god, and the inscriptions record not only the method of consulting the god, but the manner of his cures. The patient sleeps in the Abaton, sees certain visions, and

comes forth cured. There are some surgical cases, and many examples resembling those at Lourdes or Tenos, where hysterical or other similar affections are cured by the influence of imagination or sudden emotion. It is, however, difficult to make scientific use of the records. Some are contemporary dedications; but others are long lists of cases, compiled by the priests from dedications or tradition. In later times the old faith-healing lost its efficacy and the priests substituted elaborate prescriptions as to diet, baths and regimen which must have made Epidaurus resemble a modern spa. Extensive buildings were provided for the accommodation of invalids (one by Antoninus Pius), great courtyards surrounded by colonnades and chambers. A large gymnasium was in later times converted to other purposes, a small odeum being built in the middle. In the stadium, the seats and goal are well preserved. A gutter surrounds the running ground, with basins at intervals, and a post at every hundred feet of the course. The goal resembles that at Olympia; a stone sill sunk level with the ground, with parallel grooves for the feet of the runners at starting, and sockets for posts that separated the competitors.

The theatre, as Pausanias says, is the most beautiful in Greece, almost every seat being still *in situ;* the complete circle of the orchestra is marked by a sill of white limestone. There are benches with backs not only in the bottom row, but above and below the diazoma. A speaker in the orchestra is heard throughout the auditorium without raising his voice. The stage buildings are not preserved much above their foundations, and show signs of later repairs; a long rectangular building has a column front almost at a tangent to the circle of the orchestra; at the middle and at either end are doors leading into the orchestra wings; the top of this proscenium is approached by a ramp running parallel to the parodi, but sloping up as they slope down. The proscenium was originally about 14 ft. high and 12 ft. broad, corresponding approximately to the Greek stage as described by Vitruvius.

See Pausanias i. 29; *Expédition de la Morée*, ii.; Curtius, *Peloponnesus*, ii.; *Transactions of Roy. Soc. of Lit.*, 2nd series, vol. ii.; Weclawski, *De rebus Epidauriorum* (Posen, 1854).

The excavations have been recorded in the Πρακτικά of the Greek Archaeological Society, especially 1881–84 and 1889, and in Ἐφημερὶς Ἀρχαιολογική, especially 1883 and 1885; *see* also Kavvadias, *Les Fouilles d'Épidaure* and Τὸ Ἱερὸν τοῦ Ἀσκληπιοῦ ἐν Ἐπιδαύρῳ καὶ ἡ θεράπεια τῶν ἀσθενῶν; Defrasse and Lechat, *Épidaure.*

2. Epidaurus Limera (either "The Well-havened" or "The Hungry"), a city of Peloponnesus on the east coast of Laconia, founded by the people of Epidaurus the Holy, but abandoned during the middle ages when its inhabitants took possession of the promontory of Minoa, turned it into an island, and built and fortified thereon the city of Monemvasia, which became the most flourishing of all the towns in the Morea, and gave its name to the well-known Malmsey or Malvasia wine. The ruins of Epidaurus are to be seen at Palaea Monemvasia.

EPIDEMIC. A term used adjectivally or as a noun to signify the sudden outbreak of an infectious disease, of which the case incidence rises to a peak with more or less rapidity and thereafter declines, usually less rapidly. The curve thus formed shows variations in different diseases and in epidemics of the same disease. The mortality curve in any epidemic bears a general relation to the incidence curve, but the mortality curves in different epidemics of the same disease, like the incidence curves, may vary much in height and shape. (*See* EPIDEMIOLOGY.)

EPIDEMIOLOGY. In recent years more study has been given to that branch of the science of medicine which, under the name of epidemiology, displays the general factors which operate upon populations or aggregates, and lead to the outbreak of a sickness affecting several persons within a short time. The unit of the epidemiologist is a population, of a physician an individual.

The Spread of Epidemics.—Modern epidemiology is based on the collections of statistics which began half way through the 19th century, and on the associated information which was obtained as to the causation and course of epidemics by careful local enquiry into all the conditions. Even before this some countries, such as Sweden, published the figures of the deaths from numerous infectious diseases for series of years; but, though very interesting, these figures reflect more or less special conditions. Since about 1840, especially in Europe, India and America, carefully collected information exists respecting many epidemics and epidemiological conditions. Sufficient evidence is now available to examine any theory which may be offered to account for the facts. Advance has been made on a number of lines: on the modes of spread of infection; on the theory of the course, recurrence and size of epidemics; on the relation of epidemics to climatic conditions and the cause of these relations; on the knowledge of the life history of the organisms which cause epidemics; on the conditions of living which favour the spread of infectious disease.

Aetiology.—With the discovery of the organisms (*see* BACTERIOLOGY; FILTER PASSING VIRUSES; PARASITOLOGY) which cause disease, and with careful observation in the field as to the manner in which disease spreads from person to person, new viewpoints have emerged. Most diseases have their special forms of spreading which account for practically all the cases. Thus measles (*see* INFECTIOUS FEVERS) and smallpox (*q.v.*) are exceedingly infectious from person to person. Typhoid fever (*q.v.*) is nearly always carried by contaminated water or contaminated food. Cholera (*q.v.*) is spread by water and flies. Other diseases have been found to be practically non-infectious from person to person unless by means of an intermediate parasite. Thus typhus (*see* INFECTIOUS FEVERS) and trench fever are carried by lice, while yellow fever (*q.v.*) and malaria (*q.v.*) require the intervention of the mosquito. The mode of spread of some diseases is still obscure. Among these scarlet fever must be placed. While direct infection undoubtedly takes place, a satisfactory elucidation of the problems of its dissemination has not yet been arrived at.

Infectivity and Virulence.—Disease-producing organisms possess two qualities: one, the power of causing the disease; and the second the power of producing a severe attack of disease. The first may be termed infectivity and the second virulence. These qualities must not be confused. In point of fact, they are not constantly associated. In certain diseases the height of the epidemic seems to be associated with severe disease, in others with that of milder type. The former at least holds for a certain number of large epidemics of measles of which the statistics have been investigated. The latter is the case both in Glasgow and London in regard to the autumnal prevalence of scarlet fever.

Incidence.—That an epidemic might possess a definite form capable of calculation seems to have been advanced first by Farr. In 1840 he graduated the decline of the great smallpox epidemic in England to the normal curve of error, and obtained a very close representation of the facts. He promised further discussion, but seems to have given none till 1867. In this year he returned to the subject in connection with the cattle plague, writing a letter to *The Daily News*, in which it was stated that though in the popular conception plague was advancing with such rapidity that all the cattle of the country might be destroyed, in reality the force of the epidemic was spent, and that if the form of the epidemic curve up to that point were taken as a basis of calculation the future course could be foretold. The prediction proved to be very near the truth.

The theory of the course of the epidemic, however, as a guide to the solution of the problem has unfortunately not proved so fertile as might have been hoped. Some facts are quite definite. The curve of the epidemic is often found to be symmetrical, the fall corresponding closely to the rise, though in some diseases the ascent is more rapid than the descent, and in some the reverse. The equation of the curve which describes the majority of epidemics, as found by trial apart from theory, is

$$y = \frac{a}{1 + \frac{t^2 n}{b^2}}$$

where y is the number of cases at time t, t being measured from the centre of the epidemic.

Curves closely resembling that given by the above equation arise on a number of hypotheses, of which two are discussed. First, the organism may be assumed to possess at the beginning of the disease a high degree of infectivity, which decreases as the epidemic goes on. If the loss of infectivity is according to geometric law, the normal curve of error already used by Farr is the result. It is sufficient to state that on various probable hypotheses regard-

ing exposure to infection, etc., the normal curve may be so modified as to take the form found by observation. Secondly, a similar type of curve arises if we consider an epidemic dies out from lack of susceptible persons. It is not possible to distinguish statistically these hypotheses from the consideration of the epidemic form alone. In one case, however, the second hypothesis can be tested. If the form of the epidemic be calculated by assuming different degrees of infectivity on the part of the organism, an infectivity which remains constant during the epidemic, it is found that this curve becomes flatter the smaller the degree of infectivity.

Now with regard to plague in India, among brown and black rats living more or less in the same circumstances, it is observed that many more brown rats are infected than black. In such circumstances the form of the epizoötic should be different in the two species if the decline is due to lack of susceptible individuals. As a matter of fact it is nearly identical: a fact which tells strongly in favour of the hypothesis that the epidemic ends because of loss of infectivity on the part of the organisms. This example would be crucial but for the fact that the flea on which the spread of the epizoötic depends has a law of seasonal prevalence of its own.

In many cases, however, the only feasible explanation of the course of an epidemic is that the organism loses the power of infecting as the epidemic proceeds. It is difficult to believe, for instance, with regard to the great epidemic of smallpox in London in 1901–02, that there were only 8,000 people susceptible out of a population of 6,000,000. As the course of this epidemic was typical, rising and falling in the manner found to be characteristic, it cannot be argued that the decline was due to the action of the health authorities; all they can have done was to limit the extent of the epidemic, leaving its course unchanged.

Periodicity.—The next point requiring consideration is the periodicity in the epidemics of infectious diseases. Taking measles as an example, the common explanation is that each epidemic ends from the exhaustion of the number of susceptible persons, and that it is only when a new population of susceptible children has accumulated that a further outbreak occurs. This explanation fails to account for many of the facts. Even after the very large epidemic of measles in Glasgow in 1906, it was found that nearly half of the children admitted to the fever hospitals immediately thereafter suffering from other diseases had not suffered from measles, so that there must have been, with the high infectivity of the epidemic, plenty of susceptible material. The disease subject to the most extensive enquiry hitherto has been measles. Using the method of the periodogram, the statistics of London and all the chief towns of the British Isles have been analysed. It is found that in almost no case is there only one period to be discovered. In London there are several, the chief of which is 97 weeks.

Periodicity in other diseases is well known. Thus in the city of Liverpool the epidemics of scarlet fever occurred at regular intervals of four years from 1850–78. On one occasion alone was there an exception, when the interval between two epidemics was three years in place of four. A similar periodicity of five years has been observed in Glasgow. There is one specially interesting example, namely, the occurrence of plague in Bombay. In many places, such as Hong Kong, the period between each epidemic is rigidly a year. In such a case the influence of the season of the year seems a sufficient explanation. But the case of Bombay is different. The first epidemic, in 1897, had its maximum about the 40th day of the year. From this point until the last year for which statistics are available (1918) the date of the maximum of the epidemic has steadily advanced into the year, advancing about 80 days in 20 years, or an average of four days a year. The conclusion must be arrived at that while some periodicities of disease are strictly seasonal others are not so, and require some further explanation.

A further important application of mathematics to epidemiology has been made by Sir Ronald Ross in his studies on malaria (*q.v.*). Here the factors influencing the spread of the disease are numerous. Rainfall and temperature, the number of persons carrying the organism in their blood, the number of mosquitoes and the proximity of the breeding-places of the mosquito to the abodes of men, are all capable of quantitative measurement, and of furnishing guidance for suitable administrative measures.

Climate and Weather.—The relationship of epidemics to climate has received much attention in recent years, though in many cases the cause of seasonal prevalence is elusive. Thus, why scarlet fever should be so regularly an autumnal disease is not at all clear. On many cases, however, much light has been thrown. The discovery, for instance, that malaria was carried by the mosquito elucidates the seasonal distribution of that disease. A temperature of a certain height associated with pools of water is necessary for the rapid development of the mosquito, and also a certain degree of temperature for the development of the parasite in the mosquito. In the same way the zone to which sleeping sickness is limited is a narrow region in which the climate and environment are suitable to the life history of one particular tsetse fly. Much light has been thrown on the epidemiology of plague by the discovery that it was carried to man from the rat by means of the flea. Humidity is necessary for the growth of the flea, and consequently epidemics of plague can hardly occur at seasons of the year when it is warm and dry. Thus the epidemics of plague in Bombay, which have advanced progressively later and later into the year, now occur when the flea is no longer at its greatest prevalence. With this change the number of cases and deaths has greatly diminished.

Effect of Organisms.—As to the relation of epidemics to the organism which causes them, why an organism should be capable at one time of causing a great epidemic and at another only a few sporadic cases of a disease has not yet been found out. That organisms do vary in the power of infecting in this manner is a truism to anyone who has administered in the health departments of a large city. At one time the merest contact with a case of smallpox, for instance, will give rise to a large number of cases. At another time a patient suffering from smallpox may even attend a theatre without giving rise to a case of infection.

A considerable amount of evidence has been accumulated that an organism, having found a suitable host, or succession of hosts, may have its virulence unusually exalted, and if the virulence can be exalted in this manner, it is probable that some similar conditions may give rise to a great increase in the power of infection.

Environment.—While an epidemic may in many cases be chiefly or even wholly due to the active condition of the causal organism, it is to be remembered that the vitality and environment of the persons affected must also play a part. Thus, for instance, typhus fever introduced into a crowded slum in which lice are plentiful will almost certainly cause considerable havoc, but even here the havoc will be determined to a certain extent by the season of the year. If the weather be cold the people are crowded together on account of the demand for warmth, and the chance of infection is increased. In addition, in the winter, food is often scarce, and consequently vitality is low. If, on the other hand, the invasion of the organism takes place during the summer, a large epidemic will be unlikely. But though these factors act, yet if an organism has an exalted state of activity an epidemic of the disease may occur at any season of the year, even the most unlikely. Plague, for instance, especially in temperate climates, is essentially a disease of the warmer part of the year, yet it has been known occasionally to occur in large epidemics in the middle of winter, while epidemics of typhus of considerable size have been recorded in the summer time. The great epidemic of influenza (*q.v.*) in the autumn of 1918 is a striking example, such a season being a very unusual one for an outbreak of this disease. What rôle special susceptibility on the part of the population had in this case is not known.

Some other influences also act. There is some evidence that fatigue predisposes to enteric fever, an army on the march drinking polluted water tending to have a larger number stricken than a similarly conditioned civil population. Further, it cannot be doubted that the accumulated effect of seasons may tend to depress health and increase susceptibility to certain diseases. The cumulative effect of winter cold may be, perhaps, traced in children in relation to death from whooping-cough, the average minimum temperature in the winter preceding the maximum number of deaths from whooping-cough by about six weeks, while the form of the two curves is very much the same. The deaths from whooping-cough are due very largely to broncho-pneumonia, yet the sea-

sonal distribution of whooping-cough is not identical with that of the latter disease. Thus scarlet fever, being an autumnal disease and following the hot summer, might in the same way be ascribed to depression produced by continued hot weather, making certain persons more susceptible to the disease. But as scarlet fever is a disease almost absent in warm climates this explanation can hardly be complete, and some other factor must be necessary. None of these questions have at present been sufficiently investigated.

Carriers.—Another point of importance requires special reference, and that is the problem of "carriers," as individuals infected with a disease and cured as regards themselves, but who yet continue to harbour and distribute the parasite, are called. Cholera follows the pilgrims' way, enteric fever the carrier cook, diphtheria the carrier school-teacher (*see* CARRIERS).

Experimental Verification.—Recently, investigators in several countries—Topley and his collaborators in England; Webster and others at the Rockefeller Institute, New York; Neufeld, Lange and others of the Robert Koch Institute in Berlin—have applied the experimental method to the study of epidemiological problems. The plan has been to study the course of an epidemic disease introduced into a herd of mice, its evolution under conditions better defined and more simple than obtain in nature. Greenwood and Topley, for instance, have watched the progress of a fatal infectious disease of mice due to an organism of the Pasteurella group in a population of mice replenished wholly by the addition of normal animals over a period of more than three and a quarter years—that is, through a period much longer than the length of an average generation of mice. They have shown that in these circumstances the prevalence of the disease exhibits wave-like movements, and that the intervals between successive exacerbations can be diminished merely by increasing the rate of immigration of normal animals. In infections of this type the regular immigration of healthy animals is sufficient to maintain the disease indefinitely.

Prophylaxis.—In field epidemiology much work has been done in developing a method of prophylaxis against diphtheria, rendered possible by the discovery that certain persons exhibit a peculiar skin reaction (the so-called Schick reaction) after the injection within the skin of a small quantity of the toxin produced by the bacillus of diphtheria (*see* INFECTIOUS FEVERS). It is thought that such persons are especially liable to develop the disease when exposed to infection, and that an outbreak may be controlled or prevented by the immunization of those who respond to this test. This immunization is obtained by the injection of small doses of a mixture of toxin and anti-toxin. The method has been employed on a large scale, particularly in America. It is, however, too early to express a decided opinion, since the statistical evidence which has been tendered has not always been free from ambiguity.

BIBLIOGRAPHY.—An excellent general account of the progress of knowledge is contained in Haeser's *Lehrbuch der Geschichte der Medizin und der epidemischen Krankheiten*, 3rd ed. (1882); English epidemiological history is fully related in Dr. Charles Creighton's *History of Epidemics in Britain*, (1894). A paper by M. Greenwood on the "Epidemiology of Plague in India," *Journal of Hygiene*, vol. x., p. 349 (1910), gives examples of modern epidemiological methods; while his report "On the Rise, Spread, etc., of Epidemic Diseases," *Internat. Congress of Medicine*, Sec. 18, p. 49 (1913), gives a full study with literature. Two papers by John Brownlee discussing "Theory of Epidemiology in Relation to Plague," *Proc. Roy. Soc. Med.*, vol. xi., p. 86 (1918), and the "Periodicities of Epidemics of Measles," *Proc. Roy. Soc. Med.*, vol. xii., p. 77 (1919), give an account of the statistical and mathematical methods which may be used. Sir R. Ross's *Prevention of Malaria* (1910) and Sir R. W. Boyce's *Yellow Fever and Its Prevention* (1911) discuss theory and practice in all their forms. For a summary of recent work on experimental epidemiology, *see* M. Greenwood and W. W. C. Topley's paper, *Journal of Hygiene*, vol. xxiv., p. 45 (1925). A complete account of recent work on diphtheria is given in *Diphtheria, Its Bacteriology, Pathology and Immunology*, issued by the Medical Research Council (1923). *See* also J. D. Comrie, "The Effects of Volcanic Action in the Production of Epidemic Diseases," *Edinburgh Med. Jn.* (1927); K. Kisskalt, "Originating and Passing of Epidemic Diseases," *Internat. Clin.* (1926); K. Sudhof, "Epidemiologic Rules of the Past," *Jn. Am. Med. Assn.* (1925); F. G. Crookshank, "First Principles and Epidemiology," *Proc. Roy. Soc. Med.* (1919–20); S. Flexner, "Epidemiology and Recent Epidemics," *Tr. Cong. Amer. Phys. and Surg.* (1919) and *Jn. Am. Med. Assn.* (1919); A. L. Fourcade, "Chronique d'épidémiologie," *Arch. de Méd. et Pharm. Mil.* (1922); F. H. Garrison, "The New Epidemiology," *Mil. Surg.* (1923); H. B. Hemenway, "Epidemiology," *Internat. Clin.* (1918); R. J. Reece, "Progress and Problems in Epidemiology," *Lancet* (1923).

EPIDIORITE, in petrology, an altered basic igneous rock, consisting essentially of hornblende and plagioclase felspar, used in road-mending. The term is now restricted to those metamorphosed igneous rocks of gabbroic or doleritic composition in which either relict minerals or relict textures, or both, are preserved. The epidiorites thus constitute a connecting link in the transformation of basic igneous rocks to amphibolites (*q.v.*) and hornblende-schists in which recrystallization is typically complete. Though having the same general mineral composition as diorites, the epidiorites are distinctly more basic rocks. The usual mineralogical changes in the passage of dolerite or gabbro to epidiorite are the partial or complete conversion of augite to the fibrous hornblende known as uralite, with simultaneous production of sphene, and the rearrangement of the felspar molecule to form limpid grains of albite and a hydroxyl-bearing calcium-aluminium silicate, zoisite or epidote, this assemblage being known as saussurite. Other minerals such as prehnite and grossular are sometimes constituents of this saussuritic aggregate. The original ophitic or porphyritic textures of the igneous rock are usually not completely destroyed, and are strictly referred to as blastophitic and blastoporphyritic textures.

With advancing metamorphism the chemical changes are more fundamental. The albite felspar gradually becomes richer in anorthite at the expense of the epidote, but the development of the red iron-bearing garnet does not usually ensue till recrystallization is complete, when the rock is more strictly referred to as amphibolite or hornblende-schist. Epidiorites are the common products of basic igneous rocks subject to dynamic metamorphism, and as such appear in regions of comparatively low grades of metamorphism. Their chief development is in the form of small bosses, dikes and sills. Within the limits of one exposure all stages in the gradual transition from dolerite to amphibolite, through epidiorite, may frequently be studied, the cores of dikes and sills consisting of unaltered igneous rock while the margin is completely recrystallized to amphibolite or hornblende-schist.

Epidiorites are of widespread distribution occurring among slates, phyllites and schists, as in the Scottish Highlands, the Alps, the Harz, Brittany and the crystalline ranges of eastern North America, etc. Many so-called greenstones (*q.v.*) are in reality epidiorites. In many parts of the world they form the matrices of auriferous quartz veins, *e.g.*, in the Precambrian shield of western Australia. (C. E. T.)

EPIDOSITE, in petrology, a typical member of a family of metamorphic rocks composed mainly of epidote and quartz; they are pale or greenish yellow, hard, and somewhat brittle, and are derived from several kinds of rock. Some have been epidotic grits and sandstones; others are limestones which have undergone contact-alteration; but the majority are probably allied to epidiorite and amphibolite and are local modifications of rocks which were primarily basic intrusions or lavas. The sedimentary epidosites occur with mica-schists, sheared grits and granulitic gneisses; they often show, on minute examination, the remains of clastic structures. The epidosites derived from limestones may contain a great variety of minerals such as calcite, augite, garnet, scapolite, etc., but their source may usually be inferred from their close association with calc-silicate rocks in the field. The third group of epidosites may form bands, veins or irregular streaks and nodules in masses of epidiorite and hornblende-schist. In microscopic section they are often merely a granular mosaic of quartz and epidote with some iron oxides and chlorite, but in other cases they retain much of the structure of the original rock though there has been a complete replacement of the former minerals by new ones. Epidosites when streaked and variegated have been cut and polished as ornamental stones. They are translucent and hard, and hence serve for the simpler kinds of jewellery. These rocks occasionally carry gold in visible yellow specks.

EPIDOTE, a mineral species consisting of basic calcium, aluminium and iron orthosilicate, crystallizing in the monoclinic system. Well-developed crystals are of frequent occurrence: they

are commonly prismatic in habit, the direction of elongation being perpendicular to the single plane of symmetry. Many of the characters of the mineral vary with the amount of iron present (Fe_2O_3, 5–17%), for instance, the colour, the optical constants, and the specific gravity (3·3–3·5). The hardness is 6½. The colour is green, grey, brown or nearly black, but usually yellowish- or pistachio-green.

Epidote is an abundant rock-forming mineral, but one of secondary origin. It occurs in crystalline limestones and schistose rocks of metamorphic origin, and is also a product of weathering of various minerals composing igneous rocks; combined with quartz it is known as epidosite (*q.v.*). Well-developed crystals are found at many localities, the best being from Knappenwand, in the Untersulzbachthal in Salzburg, and Prince of Wales island, Alaska. The perfectly transparent, dark-green crystals from the Knappenwand and Brazil have occasionally been cut as gem-stones.

Belonging to the same isomorphous group with epidote are the species piedmontite and allanite, which may be described as manganese and cerium epidotes respectively. *Piedmontite* occurs as small, reddish-black, monoclinic crystals in the manganese mines at San Marcel, Piedmont, and in crystalline schists at several places in Japan. The purple colour of the Egyptian *porfido rosso antico* is due to the presence of this mineral. *Allanite* contains ferric iron and metals of the cerium group; externally it differs widely from epidote, being black or dark brown in colour, pitchy in lustre, and opaque in the mass. Although not a common mineral it is of fairly wide distribution as a primary accessory constituent of many crystalline rocks. Orthite, from ὀρθός, "straight," is a hydrated form found as slender prismatic crystals, sometimes 1ft. in length, at Finbo, Sweden. (L. J. S.)

EPIGONI: *see* OEDIPUS.

EPIGONION, an ancient stringed instrument mentioned in Athenaeus. The epigonion was invented, or at least introduced into Greece, by Epigonus, a Greek musician of Ambracia, in Epirus, who was admitted to citizenship at Sicyon as a recognition of his great musical ability, and of his having been the first to pluck the strings with his fingers, instead of using the plectrum. The instrument, which Epigonus named after himself, had 40 strings and was a kind of harp. When Epigonus lived is unknown.

EPIGRAM, which originally meant "an inscription," has in the course of time come to mean any pithy (and usually pungent) saying in prose or verse. We find that the name has been given—first, in strict accordance with its Greek etymology, to any actual inscription on monument, statue or building; secondly, to verses never intended for such a purpose, but assuming for artistic reasons the epigraphical form; thirdly, to verses expressing with something of the terseness of an inscription a striking or beautiful thought; and fourthly, by unwarrantable restriction, to a little poem ending in a "point," especially of the satirical kind. The last has obtained popularity from the well-known:—

> "The qualities rare in a bee that we meet
> In an epigram never should fail;
> The body should always be little and sweet,
> And a sting should be left in its tail"—

which represent the older Latin of some unknown writer:—

> "Omne epigramma sit instar apis: sit aculeus illi;
> Sint sua mella; sit et corporis exigui."

Scaliger, in the third book of his *Poetics,* gives a fivefold division of epigrams which displays a certain ingenuity in the nomenclature but is very superficial: the first class takes its name from *mel,* or honey, and consists of adulatory specimens; the second from *fel,* or gall; the third from *acetum,* or vinegar; and the fourth from *sal,* or salt; while the fifth is styled the condensed, or multiplex. This classification is adopted by Nicolaus Mercerius in his *De conscribendo epigrammate* (Paris, 1653); but he supplemented it by another of much more scientific value, based on the figures of the ancient rhetoricians. Lessing, in the preface to his own epigrams, gives an interesting treatment of the theory, his principal doctrine being that there ought to be two parts more or less clearly distinguished—the first awakening the reader's attention in the same way as an actual monument might do, and the other satisfying his curiosity in some unexpected manner.

The verse epigram is one of the most catholic of literary forms, and lends itself to the expression of almost any feeling or thought. It may be an elegy, satire, or love-poem, an embodiment of the wisdom of the ages, or a bon-mot set off with rhymes.

From its very brevity there is no small danger of the epigram passing into childish triviality. For proof of this there is unfortunately no need to look far; but perhaps the reader could not find a better collection ready to his hand than the second 25 of the *Epigrammatum centuriae* of Samuel Erichius; by the time he reaches No. 11 of the 47th century, he will be quite ready to grant the appropriateness of the identity maintained between the German *Seele,* or soul, and the German *Esel,* or ass.

Of the epigram as cultivated by the Greeks an account is given in the article ANTHOLOGY. As regards Latin literature, the epigrammatists whose work has been preserved are comparatively few, and though several of them, as Catullus and Martial, are men of high literary genius, too much of what they have left behind is vitiated by brutality and obscenity. On the subsequent history of the epigram, indeed, Martial has exercised an influence as baneful as it is extensive. Nearly all the learned Latinists of the 16th and 17th centuries may claim admittance into the list of epigrammatists. Melanchthon, who succeeded in combining so much of Pagan culture with his Reformation Christianity, has left us some graceful specimens, but his editor, Joannes Major Joachimus, has so little idea of what an epigram is, that he includes in his collection some translations from the Psalms. The Latin epigrams of Étienne Pasquier were among the most admirable which the Renaissance produced in France. John Owen, a Cambro-Briton, attained unusual celebrity in this department, and is regularly distinguished as Owen the Epigrammatist. The tradition of the Latin epigram has been kept alive in England by such men as Porson, Vincent Bourne and Walter Savage Landor.

In English literature proper there is no writer like Martial in Latin or Logau in German, whose fame is entirely due to his epigrams. Epigram, however, is used by earlier English writers with laxity, and given or withheld without apparent reason. Weever's collection (1599) is of interest mainly because of its allusion to Shakespeare. Ben Jonson furnishes several noble examples in his *Underwoods;* and one or two of Spenser's little poems and a great many of Herrick's are properly classed as epigrams. Cowley, Waller, Dryden, Prior, Parnell, Swift, Addison, Johnson, Goldsmith, Young, Burns, Blake, Shelley and Landor have all been at times successful in their epigrammatical attempts; but perhaps none of them has proved himself so much "to the manner born" as Pope, whose name indeed is almost identified with the epigrammatical spirit in English literature. Among contemporary poets, Sir William Watson, W. B. Yeats, Hilaire Belloc and J. C. Squire have all written brilliant epigrams.

The French are undoubtedly the most successful cultivators of the "salt" and the "vinegar" epigram; and from the 16th century downwards many of their principal authors have earned celebrity in this department. The epigram was introduced into French literature by Mellin de St. Gelais and Clément Marot. It is enough to mention the names of Boileau, J. B. Rousseau, Lebrun, Voltaire, Marmontel, Piron, Rulhière, and M. J. Chénier. In spite of Rapin's dictum that a man ought to be content if he succeeded in writing one really good epigram, those of Lebrun alone number upwards of 600, and a very fair proportion of them would doubtless pass muster even with Rapin himself.

While any fair collection of German epigrams will furnish examples that for keenness of wit would be quite in place in a French anthology, the Teutonic tendency to the moral and didactic has given rise to a class but sparingly represented in French. The very name of *Sinngedichte* bears witness to this peculiarity, which is exemplified equally by the rude *priameln* or *proeameln,* of the 13th and 14th centuries, and the polished lines of Goethe and Schiller. Logau published his *Deutsche Sinngedichte Drey Tausend* in 1654, and Wernicke no fewer than six volumes of *Ueberschriften oder Epigrammata* in 1697; Kästner's *Sinngedichte* appeared in 1782, and Haug and Weissen's *Epigrammatische Anthologie* in 1804. Kleist, Opitz, Gleim, Hagedorn, Klopstock

and A. W. Schlegel all possess some reputation as epigrammatists; Lessing is *facile princeps* in the satirical style; and Herder has enriched his language from Oriental and classical sources.

The two collections of epigrams most accessible to the English reader are Booth's *Epigrams, Ancient and Modern* (1863) and Dodd's *The Epigrammatists* (1870). In the appendix to the latter is a pretty full bibliography.

EPIGRAPHY, a term used to denote (1) the study of inscriptions collectively; (2) the science connected with the classification and explanation of inscriptions; and (3) in a more contracted sense, the palaeography in inscriptions. Coins come under the heading NUMISMATICS.

See INSCRIPTIONS; PALAEOGRAPHY.

EPILEPSY, a disorder the essential symptom of which is a recurring, abrupt loss or alteration of consciousness, includes many types of seizures, *e.g.*, convulsions, emotional explosions, irritable periods, vertigoes, and psychic clouding. There are normal gradations of consciousness, as sleep, degrees of attentiveness or mental concentration, etc. Convulsions, because of their alarming appearance, early impressed mankind. This continued, preventing recognition of mental traits and important minor phenomena of the epilepsies. Symptomatic convulsions occur in other disorders, *e.g.*, uraemia, diabetes, eclampsia, psychosis, and in infancy and childhood, especially at the onset of acute infections.

Facts pertaining to heredity are not established sufficiently to formulate laws regarding transmission of epilepsies. Direct similar heredity in epilepsy is uncommon. Infections and malnutrition during foetal life, infancy, and childhood may damage vital systems and produce subsequent epilepsy. The majority of epilepsies seem due to multiple factors. Injurious influences affecting the brain during early life may permit later of otherwise harmless influences exciting seizures. Without such predisposition, normal functioning of essential organs would withstand the influence which produces epilepsy. Paralytics surviving from birth injury usually become epileptic. Finer changes in the nervous system from birth injury often cause subsequent mental defect, epilepsy, or both. In many epileptics the heart and large blood-vessels are abnormally small. There may be other organ inferiorities. Seemingly inhibition, not stimulation of the cerebral cortex, resulting in loss of control over lower brain centres (decerebration) produces impairment or loss of consciousness with convulsive manifestations. Regressive changes may result in lack of inhibitory control of the brain.

The gravity of a skull injury bears no relationship to development of traumatic epilepsy, which sometimes follows comparatively slight head injuries. Only a small proportion of head injuries in children or adults result in epilepsy. In epileptics having frequent seizures, the brain at autopsy may appear quite normal, finer changes being found upon microscopic examination. In cases with marked abnormalities there may have been few seizures. Such brain changes are considered in some to have been predisposing, in others resultant or merely concomitant.

The immediate cause of epileptic phenomena is cerebral vascular disturbance with resulting nutritive upset and transitory oedema of parts of the brain. Such vasomotor disturbance in the brain cannot ordinarily be demonstrated in life nor found *post mortem*. It may be caused by insufficient or excessive activity of endocrines, protein sensitization, passage from the intestines into the circulation of toxins which eventually reach the brain, toxic substances produced locally in the brain as a result of vascular disturbance in encephalitis, brain tumour, arteriosclerosis, brain scars with adhesions, etc. Faulty metabolism of foods may result in substances toxic to brain cells and cause seizures, although simple retention of ordinary waste products may not so act. Some investigators claim an acidosis, others an alkalosis, precipitates seizures. Attacks may be induced by excess or undue diminution of blood sugar, sudden lowering or increase of blood pressure, great loss of blood, increased intracranial pressure, etc. Some maintain a severe convulsion automatically adjusts faulty metabolism resulting in an interval of relatively normal health. Habit may act in causing recurrence of seizures. The importance of eyestrain, teething, worms, scars on extremities, abnormalities of sex organs, etc., as reflex causes, has been exaggerated. Apparently menstruation, pregnancy, and menopause provoke some seizures. Up to 20 years of age the two sexes are equally affected, subsequently males exceed because of habits, occupation, etc.

Some describe the epileptic as one with inherited defect which causes various types of stress, ultimately psychic in character, producing reactions of unconsciousness, recurring periodically, which permits riddance of a particular, adaptive demand through regression to the unconscious, a state of peace and harmony, comparable to existence before reality had become part of the mental demand. Mentality of epileptics may range from normal to marked defectiveness. Deprivation, retardation, and deterioration are factors acting in many. A number are highly intelligent, the majority living normally in their community never reaching institutions. In some, outstanding symptoms are ego-centricity, supersensitiveness, emotional poverty, self-satisfaction, superficial religious manifestations, and abnormal fluctuation of attention.

Attacks may be classified as follows: motor seizures, with or without apparent loss of consciousness; sensory seizures; psychic disturbances, acute or chronic. All symptoms considered part of the disorder are modifications of one or all of these reactions. Automatism, a part of certain seizures, is frequently unrecognized, the individual unconsciously committing certain acts. Medicolegally such periods as well as psychic phenomena of epilepsy are of importance. Many present "epileptic optimism," *i.e.*, failure to appreciate the necessity for avoiding dangerous situations or assuming undue responsibilities. An epileptic may appreciate the onset of a seizure, but not recall it by lack of memory fixation. Numerous factors seemingly favour occurrence of seizure, *e.g.*, circulatory changes accompanying onset and cessation of sleep, puberty, dietary indiscretions, emotional reactions, atmospheric humidity, etc.

Minor attacks are often overlooked, as the person may not fall; simply pauses for an instant, looks strange, then resumes conscious life. He may fall and immediately arise, such seizure being mistaken for syncope, but distinguished by suddenness of onset and recovery. Ramsay Hunt suggests attacks are due to sudden momentary loss of postural muscular control, associated with transient unconsciousness. Recurring mild attacks in children may be a forerunner of epilepsy or cease without impairment.

Cerebral apoplexy seldom occurs in severe convulsions, although minute haemorrhages without doubt do, causing recurrence of symptoms. Study of the seizure itself does not with certainty differentiate those due to organic disease from those due to psychic cause. Research has thus far failed to prove perversions of function or organs peculiar to the epilepsies. No drug is specific because essential epilepsy is not a disease, but a symptom complex resulting from unknown underlying conditions. The basis of treatment is to find and remove, at least minimize, factors that adversely influence the central nervous system.

The epileptic should be placed under proper guidance early, not necessarily public surveillance, but a physician or person competent to advise. In effecting readjustment of life, it is necessary carefully to analyze symptoms and individualize treatment possible to carry out. The mode of living cannot be entirely changed, let alone environment; nevertheless, many circumstances or habits which act injuriously may be diminished. The patient must be considered as a whole and not solely as presenting types of seizures. Reasonable restriction of diet, allowing for maintenance of normal nutrition, with exclusion of articles difficult to digest will accomplish as much as extreme methods of prolonged starvation. Some are benefited with increase of fats, some by other food groups, depending on chemical examinations of blood, urine, etc. Due care must be given to the elimination of waste products. Surgery is indicated only in certain symptomatic epilepsies, *e.g.*, brain tumour and to relieve conditions lowering general health.

The longer the freedom from seizures, and the better the adjustment to ordinary environments, the better the prognosis. Carelessness in mode of life may result in recurrence of seizures. Remissions over more or less prolonged periods, irrespective of

treatment, are not uncommon. Spontaneous arrest seemingly occurs in some. Expectation of life in epileptics is some 20 years less than in others. To effect material improvement there must be only disturbed function, not destruction, of portions of the central nervous system and related organs. Psychic-maladjustments, lack of adaptation of organs and the individual as a whole, *i.e.*, constitutional instability, the environment created by neurotic relations or associates, or the ordinary environment to the stresses of which the abnormal person cannot react properly are factors influencing epilepsy. An epileptic ordinarily presents the reactions common to mankind, a fact to be remembered in prescribing for him. Salts of bromine have been used with more or less success for 70 years. Sodium or strontium salts produce least irritation in the gastro-intestinal tract. If bromides are used particular care must be given to elimination and avoidance of deleterious influence on the mentality. Favourable results have followed the use of luminal (phenyl-barbital) in diminishing frequency of seizures, especially of the severer type, or holding them completely in abeyance. Alleged "cure-alls" often do much harm. Marriage of epileptics should be discouraged because of possibility of transmission of the condition to offspring, incompatibility of temperament, and difficulty of assuming responsibility. Educational work among younger epileptics is beneficial, *e.g.*, discipline should be inculcated, interests aroused and self-control developed. Responsibility begets confidence. The epileptic should be allowed to participate in activities of his circle, permitting energy outlets. The feeling that he is a person set apart from relations and associates has a bad influence on mental functioning and metabolism. Occupation inducing normal healthy fatigue is most beneficial.

(*See* Epileptic Fit.) (W. T. S.)

EPILEPTIC FIT. Three well-marked varieties of the epileptic seizure are known, *le grand mal, le petit mal* and *Jacksonian epilepsy*. Any may exist alone, but the two former may occur together. The first is generally known as an *epileptic fit*.

Although in most instances an attack comes on suddenly, it is in many cases preceded by certain indications or warnings. These are very varied and may be in the form of some temporary change in the disposition, such as unusual depression or elevation of spirits, or of some alteration in the look. Besides these general symptoms, peculiar sensations often immediately precede the onset of the fit (*aura epileptica*). The aura may be mental *e.g.*, an agonizing feeling of momentary duration; sensorial *e.g.*, pain in a limb or in some internal organ, or may concern the special senses; or, motorial *e.g.*, contractions or trembling in some of the muscles. When such sensations affect a limb, the employment of firm compression by the hand or by a ligature occasionally succeeds in warding off an attack. The aura may be so distinct and of such duration as to enable the patient to lie down, or seek a place of safety before the fit comes on.

The seizure is usually preceded by a loud scream or cry, not due to terror or pain, but to the convulsive action of the muscles of the larynx, and expulsion of a column of air through the narrowed glottis. If the patient is standing he immediately falls, and often sustains serious injury. Unconsciousness is complete, and the muscles generally are in a state of stiffness or tonic contraction, mainly affecting one side of the body. The head is jerked towards one or other shoulder, the breathing is for the moment arrested, the countenance first pale then livid, the pupils dilated and the pulse rapid. This, the first stage of the fit, generally lasts for about half a minute, and is followed by the state of clonic (*i.e.*, tumultuous) spasm of the muscles, in which the whole body is thrown into violent agitation, occasionally so great that bones are fractured or dislocated. The eyes roll wildly, the teeth are gnashed together, and the tongue and cheeks are often severely bitten. The breathing is noisy and laborious, and foam (often tinged with blood) issues from the mouth, while the contents of the bowels and bladder are ejected. This stage lasts from a few seconds to several minutes, when the convulsive movements gradually subside, and relaxation of the muscles takes place, together with partial return of consciousness, the patient looking confusedly about him and attempting to speak. This, however, is soon followed by drowsiness and stupor, which may continue for several hours, when he awakes either apparently quite recovered or fatigued and depressed, and occasionally in a state of excitement which sometimes assumes the form of mania.

Epileptic fits of this sort succeed each other with varying degrees of frequency, and occasionally, though not frequently, with regular periodicity. In some persons they only occur once in a lifetime, or once in the course of many years, while in others they return every week or two, or even are of daily occurrence, and occasionally there are numerous attacks each day. When the fit returns it is not uncommon for one seizure to be followed by another within a few hours or days. Occasionally there occurs a constant succession of attacks extending over many hours, and with such rapidity that the patient appears as if he had never come out of the one fit. The term *status epilepticus* is applied to this condition, which is sometimes fatal. In many epileptics the fits occur by night as well as by day, but in some instances they are entirely nocturnal, and then the disease may long remain unrecognized.

The second manifestation of epilepsy (*le petit mal*), differs from that above described in the absence of the convulsive spasms. It consists essentially in a sudden, short arrest of volition and consciousness, and may be accompanied with staggering or some alteration in position or motion, or simply exhibit itself in a look of absence or confusion, and should the patient happen to be engaged in conversation, by an abrupt termination of the act. In general it lasts but a few seconds, and the individual resumes his occupation without perhaps being aware of anything having been the matter. In some instances there is a degree of spasmodic action in certain muscles which may cause the patient to make some unexpected movement, such as turning half round, or walking abruptly aside, or may show itself by some unusual expression of countenance, such as squinting or grinning. There may be some aura preceding such attacks, and also faintness following them.

The third manifestation—*Jacksonian epilepsy* or *partial epilepsy*—is distinguished by the fact that consciousness is retained or lost late. The patient is conscious throughout, and is able to watch the march of the spasm. The attacks are usually the result of lesions in the motor area of the brain *e.g.*, cerebral tumour or depressed fracture of skull.

Epilepsy appears to exert no necessarily injurious effect upon the general health, and is quite consistent with great bodily vigour. It is very different, however, with regard to its influence upon the mind. Allusion has already been made to the occasional occurrence of maniacal excitement as one of the results of the epileptic seizure. Such attacks (epileptic insanity) are generally accompanied by dangerous and violent acts and appear to be more frequently associated with the milder form of epilepsy where they either replace or immediately follow the short period of unconsciousness. The subject is one of the greatest medico-legal interest and importance in regard to criminal responsibility.

EPILOBIUM, a genus of plants of the family Onagraceae, popularly called willow-herbs (*q.v.*). There are about 160 species, all confined to temperate and Arctic regions; 9 are found in the British Isles and about 40 occur in North America. They are mostly tall herbs with pink, purple or whitish flowers.

EPILOGUE. The appendix or supplement to a literary work, and in particular to a drama in verse, is called an *epilogue*, from ἐπίλογος the name given by the Greeks to the peroration of a speech. As we read in Shakespeare's *Midsummer Night's Dream,* the epilogue was generally treated as the apology for a play; it was a final appeal made to encourage the good-nature of the audiences, and to deprecate attack. Ben Jonson made it a feature of his drama, and may almost be said to have invented the tradition of its regular use. He employed the epilogue for two purposes, either to assert the merit of the play or to deprecate censure of its defects. Beaumont and Fletcher used the epilogue sparingly, but after their day it came more and more into vogue, and the form was almost invariably that which Ben Jonson had brought into fashion, namely, the short complete piece in heroic couplets. The hey-day of the epilogue, however, was the Restoration, and from 1660 to the decline of the drama in the reign of

Queen Anne scarcely a play, serious or comic, was produced on the London stage without a prologue and an epilogue. It became the custom for playwrights to ask their friends to write these poems for them, and the publishers would even come to a prominent poet and ask him to supply one for a fee. It gives us an idea of the seriousness with which the epilogue was treated that Dryden originally published his valuable "Defence of the Epilogue; or An Essay on the Dramatic Poetry of the Last Age" (1672) as a defence of the epilogue which he had written for *The Conquest of Granada*.

EPIMENIDES, a semi-historical poet and prophet of Cnossos, in Crete, who lived in the 6th century B.C. He is said to have fallen into a deep sleep in the Dictaean cave, from which he did not awake for 57 years (Diogenes Laërtius i. 109–115). When the Athenians were visited by a pestilence, in consequence of the murder of Cylon, he was invited by Solon (596) to purify the city. He died in Crete at an advanced age; according to his countrymen, who afterwards honoured him as a god, he lived nearly 300 years. According to another story, he was taken prisoner in a war between the Spartans and Cnossians and put to death by his captors because he refused to prophesy favourably for them. A collection of oracles, a theogony, an epic poem on the Argonautic expedition, prose works on purifications and sacrifices, and a cosmogony were attributed to him. He is supposed to be the Cretan prophet alluded to in the epistle to Titus (i. 12).

See H. Demoulin, *Épimenide de Crète* (1901); H. Diels, *Die Fragmente der Vorsokratiker* (1903); O. Kern in Pauly-Wissowa's *Realencyklopädie*.

ÉPINAL, a town on the north-eastern frontier of France, capital of the department of Vosges, 46 m. S.S.E. of Nancy on the Eastern railway between that town and Belfort. Pop. (1926) 21,959. Épinal grew round a 10th century monastery, founded by Theodoric (Dietrich) I., bishop of Metz, whose successors ruled the town till 1444, when its inhabitants placed themselves under King Charles VII. In 1466 it was transferred to the duchy of Lorraine, and in 1766 it was, along with that duchy, incorporated with France. It was occupied by the Germans in the Franco-Prussian War. The town proper—the Grande Ville—stands on the right bank of the Moselle, which here divides into two arms forming an island whereon another quarter—the Petite Ville—is built. The lesser of these two arms, which is canalized, separates the island from the suburb of Hospice on its left bank. On the right bank of the Moselle a park surrounds the ruins of an old stronghold which dominated the Grande Ville from a height on the east. The church of St. Goëry (or St. Maurice) preserves a tower of the 12th century. The old hospital on the island-quarter contains a museum with paintings, Gallo-Roman antiquities, sculpture, etc. Close by stands the library, which possesses many valuable mss.

The fortifications of Épinal are connected southward with Belfort, Dijon and Besançon, by the fortified line of the Moselle, and north of it lies the unfortified zone called the *Trouée d'Épinal*, a gap between Épinal and Toul, another great fortress. The circle of forts, with a perimeter of nearly 30 m., was in 1895 reinforced by the construction of sixteen new works.

Épinal is the seat of a prefect and of a court of assizes and has tribunals of first instance and of commerce, a board of trade-arbitrators, a chamber of commerce and an industrial and commercial school. The town, which is important as the centre of a cotton-spinning region, carries on the spinning, weaving and printing of cotton and the manufacture of glucose, embroidery and hats. An industry peculiar to Épinal is the production of cheap images, lithographs and engravings. There is also trade in wine, grain, live-stock and starch products made in the vicinity. Épinal is an important junction on the Eastern railway.

EPINAOS, in architecture, the open vestibule behind the enclosed portion, or cella, of a temple; the rear porch. When enclosed, it is known as an *opisthodomos*.

EPINAY, LOUISE FLORENCE PETRONILLE TARDIEU D'ESCLAVELLES D' (1726–1783), French writer, was born at Valenciennes on March 11, 1726. She is well known on account of her *liaisons* with Rousseau and Baron von Grimm, and her acquaintance with Diderot, D'Alembert, D'Holbach and other French men of letters. Her marriage with her cousin Denis Joseph de La Live d'Epinay, a collector-general of taxes was an unhappy one; and Louise d'Epinay obtained a formal separation in 1749. She settled in the château of La Chevrette in the valley of Montmorency, and there received a number of distinguished visitors. Conceiving a strong attachment for J. J. Rousseau, she furnished for him in 1756 in the valley of Montmorency a cottage which she named the "Hermitage," and in this retreat he found for a time the quiet rural pleasures he praised so highly. Rousseau, in his *Confessions*, affirmed that the inclination was all on her side; but as, after her visit to Geneva, Rousseau became her bitter enemy, little weight can be given to his statements. Her intimacy with Grimm, which began in 1755, marks a turning-point in her life, for under his influence she escaped from the somewhat compromising conditions of her life at La Chevrette. In 1757–59 she paid a long visit to Geneva, where she was a constant guest of Voltaire. In Grimm's absence from France (1775–76), Madame d'Epinay continued, under the superintendence of Diderot, the correspondence he had begun with various European sovereigns. She spent most of her later life at La Briche, a small house near La Chevrette, in the society of Grimm and of a small circle of men of letters. She died on April 17, 1783. Her *Conversations d'Emilie* (1774), composed for the education of her grand-daughter, Emilie de Belsunce, was crowned by the French Academy in 1783. The *Mémoires et Correspondance de Mme. d'Epinay, renfermant un grand nombre de lettres inédites de Grimm, de Diderot, et de J.-J. Rousseau, ainsi que des détails,* etc., was published at Paris (1818) from a ms. which she had bequeathed to Grimm. The *Mémoires* are written in the form of an autobiographic romance, in which Madame d'Epinay figures as Madame de Montbrillant, René is generally recognized as Rousseau, Volx as Grimm, Garnier as Diderot. All the letters and documents published along with the *Mémoires* are genuine. Many of Madame d'Epinay's letters are contained in the *Correspondance de l'abbé Galiani* (1818). Two anonymous works, *Lettres à mon fils* (Geneva, 1752) and *Mes moments heureux* (Geneva, 1759), are also by Madame d'Epinay.

See Rousseau's *Confessions;* Lucien Perey [Mlle. Herpin] and Gaston Maugras, *La Jeunesse de Mme. d'Épinay, les dernières années de Mme. d'Épinay* (1882–83); Sainte-Beuve, *Causeries du lundi*, vol. ii.; Edmond Scherer, *Études sur la littérature contemporaine*, vols. iii. and vii. There are editions of the *Mémoires* by L. Enault (1855) and by P. Boiteau (1865); and an English translation, with introduction and notes (1897), by J. H. Freese.

EPINEPHRINE: *see* ADRENALIN; SUPRARENAL EXTRACT.

EPIPHANIUS, SAINT (*c.* 315–402), Bishop of Constantia or Salamis, a celebrated Church Father, born at Bezanduca, a village of Palestine, and probably of Jewish extraction. In his youth he resided in Egypt, where he freed himself from Gnostic influences. Returning to Palestine he was ordained presbyter and became the president of a monastery which he founded near his native place. In 367 he was nominated bishop of Constantia, previously known as Salamis, the metropolis of Cyprus—an office which he held till his death. Epiphanius devoted himself to the spread of monasticism, and the confutation of heresy, of which he regarded Origen and his followers as the chief representatives. He denounced John, bishop of Jerusalem from his own pulpit at Jerusalem so violently that the bishop sent his archdeacon to request him to desist. Instigated by Theophilus, bishop of Alexandria, he summoned a council of Cyprian bishops to condemn the errors of Origen. Later he came into conflict with Chrysostom, the patriarch of Constantinople, who had given temporary shelter to four Nitrian monks whom Theophilus had expelled on the charge of Origenism. The monks gained the support of the empress Eudoxia, and when she summoned Theophilus to Constantinople the aged Epiphanius went with him, but died on his way home. The principal work of Epiphanius is the *Panarion,* or treatise on heresies, the accounts of the earlier errors (where he has preserved large excerpts from the original Greek of Irenaeus) being the more reliable. He also wrote the *Ancoratus,* or discourse on the true faith, a treatise on Jewish weights and measures, another (incomplete) on ancient gems, and two epistles to

John of Jerusalem and Jerome. His other works are lost. In allusion to his knowledge of Hebrew, Syriac, Egyptian, Greek and Latin, Jerome styles Epiphanius Πεντάγλωσσος (Five-tongued). His erudition is outweighed by his borrowing, his prejudice, and his credulity.

See the church histories of Socrates and Sozomen, Palladius' *De vita Chrysostomi* and Jerome's *De vir. illust.* 114. His works were published by Petau (Petavius) 2 vols. (Paris, 1622) and by Migne, *Patr. Graec.* 41–43. The last edition of the *Ancoratus* and *Panarion* is by K. Holl, 2 vols. (Leipzig, 1915). His *Discourses on the Holy Virgin* was edited with an Eng. trans. by Wallis Budge in *Misc. Coptic Texts* (1915).

Other theologians of the same name were: (1) Epiphanius Scholasticus, friend of Cassiodorus; (2) Epiphanius, bishop of Ticinum (Pavia), *c.* 438–496; (3) Epiphanius, bishop of Constantia and Metropolitan of Cyprus (the Younger), *c.* A.D. 680, to whom some critics have ascribed certain works supposedly by the greater Epiphanius; (4) Epiphanius, bishop of Constantia in the 9th century, to whom a similar attribution has been made.

EPIPHANY, FEAST OF, the commemoration of the Baptism, also called by the Greek fathers of the 14th century the Theophany or Theophanies, and the Day of Lights, *i.e.*, of the Illumination of Jesus or of the Light which shone in the Jordan. In the Teutonic west it has become the Festival of the three kings (*i.e.*, the Magi), or simply Twelfth day. Leo the Great called it the Feast of the *Declaration;* Fulgentius, of the *Manifestation;* others, of the *Apparition* of Christ.

Clement of Alexandria first mentions it. Writing *c.* 194 he states that the Basilidians feasted the day of the Baptism, devoting the whole night which preceded it to lections of the scriptures. They fixed it in the 15th year of Tiberius, on the 15th or 11th of the month Tobi, dates of the Egyptian fixed calendar equivalent to January 10th and 6th. When Clement wrote the great church had not adopted it, but toward A.D. 300 it was widely in vogue.

In the age of the Nicene Council, A.D. 325, the primate of Alexandria was charged at every Epiphany Feast to announce to the churches in a "Festal Letter" the date of the forthcoming Easter. In Jerusalem, according to the epistle of Macarius to the Armenians, *c.* 330, the feast was kept with zeal and splendour, and was with Easter and Pentecost a favourite season for Baptism. We have evidence of the 4th century from Spain that a long fast marked the season of Advent, and prepared for the feast of Epiphany on the 6th of January. The council of Saragossa *c.* 380 enacted that for 21 days, from the 17th of December to the 6th of January, the Epiphany, the faithful should not dance or make merry. Our earliest Spanish lectionary, the *Liber comicus* of Toledo, edited by Don Morin (*Anecd. Maredsol.* vol. i.), provides lections for five Sundays in Advent, and the gospel lections chosen regard the Baptism of Christ, not His Birth, of which the feast, like that of the Annunciation, is mentioned, but not yet dated, December 25 being assigned to St. Stephen. In Armenia as early as 450 a month of fasting prepared for the Advent of the Lord at Epiphany, and the fast was interpreted as a reiteration of John the Baptist's season of Repentance.

In Antioch as late as about 386 Epiphany and Easter were the two great feasts, and the physical Birth of Christ was not yet feasted. On the eve of Epiphany after nightfall the springs and rivers were blessed, and water was drawn from them and stored for the whole year to be used in lustrations and baptisms. Epiphanius boldly removed the date of the Baptism to the 8th of November. "January 6" (=Tobi 11), he writes, "is the day of Christ's Birth, that is, of the Epiphanies." He uses the plural, because he adds on January 6 the commemoration of the water miracle of Cana. Although in 375 he thus protested that January 6 was the day "of the Birth after the Flesh," he became before the end of the century a convert, according to John of Nice, to the new opinion that December 25 was the real day of this Birth. That as early as about 385, January 6 was kept as the physical birthday in Jerusalem, or rather in Bethlehem, we know from a contemporary witness of it, the lady pilgrim of Gaul (Egeria Silvia), whose *peregrinatio,* recently discovered by Gamurrini, is confirmed by the old Jerusalem Lectionary preserved in Armenian (translated in *Rituale Armenorum* [1905]).

In 385 Pope Siricius calls January 6 *Natalicia,* "the Birthday of Christ or of Apparition," and protests against the Spanish custom (at Tarragona) of baptizing on that day—another proof that in Spain in the 4th century it commemorated the Baptism. In Gaul at Vienna in 360 Julian the Apostate, out of deference to Christian feeling, went to church "on the festival which they keep in January and call Epiphania."

Why the feast of the Baptism was called the feast or day of the Saviour's Birth, and why fathers of that age when they call Christmas the birthday constantly qualify and add the words "in the flesh," we are able to divine from Pope Leo's (*c.* 447) 18th Epistle to the bishops of Sicily. For here we learn that in Sicily they held that in His Baptism the Saviour was reborn through the Holy Spirit.

OTHER MANUSCRIPTS

Fortune has preserved to us among the *Spuria* of several Latin fathers, Ambrose, Augustine, Jerome and Maximus of Turin, various homilies for Sundays of the Advent fast and for Epiphany. The Advent lections of these homilists were much the same as those of the Spanish *Liber comicus;* and they insist on Advent being kept as a strict fast, without marriage celebrations. Their Epiphany lection is, however, Matt. iii. 1–17, which must therefore have once on a time been assigned in the *Liber comicus* also in harmony with its general scheme. The baptism is declared by these homilists to have been "the consecration of Christ," and "regeneration of Christ and a strengthening of our faith," to have been "Christ's second nativity." "This *second birth* hath more renown than his first . . . for now the God of majesty is inscribed (as his father), but then (at his first birth) Joseph the Carpenter was assumed to be his father . . . he hath more honour who cries aloud from Heaven (*viz.*, God the Father), than he who labours upon earth" (*viz.*, Joseph).

Another homily preserved in a ms. of the 7th or 8th century and assigned to Maximus of Turin declares that the Epiphany was known as the Birthday of Jesus, either because He was then born of the Virgin or *reborn in baptism.* As late as the 9th century the Armenians had at least three discrepant dates for the Annunciation—January 5, January 9, April 6; and of these January 5 and 9 were older than April 6, which they perhaps borrowed from Epiphanius's commentary on the Gospels. The Epiphany feast had therefore in its own right acquired the name of *natalis dies* or birthday, as commemorating the spiritual rebirth of Jesus in Jordan, before the *natalis in carne,* the Birthday *in the flesh,* as Jerome and others call it, was associated with it. This idea was condemned as Ebionite in the 3rd century, yet it influences Christian writers long before and long afterwards.

A letter is preserved by John of Nice of a bishop of Jerusalem to the bishop of Rome which attests a temporary union of both feasts on January 6 in the holy places. The faithful, it says, met before dawn at Bethlehem to celebrate the Birth from the Virgin in the cave; but before their hymns and lections were finished they had to hurry off to Jordan, 13 m. the other side of Jerusalem, to celebrate the Baptism, and by consequence neither commemoration could be kept fully and reverently. The writer therefore begs the pope to look in the archives of the Jews brought to Rome after the destruction of Jerusalem, and to ascertain from them the real date of Christ's birth. The pope looked in the works of Josephus and found it to be December 25. The letter's genuineness has been called in question; but from internal evidence it appears that it could not have been invented. Now we know what sort of considerations influenced this sect in fixing other feasts, so we have a clue. They fixed the Birth of Jesus on Pachon 25 (=May 20), the day of the Niloa, or feast of the descent of the Nile from heaven. We should thus expect January 6 to be equally a Nile festival, as it actually was. On Tobi 11, says Epiphanius (*c.* 370), every one draws up water from the river and stores it up, not only in Egypt itself, but in many other countries. In many places, he adds, springs and rivers turn into wine on this day, *e.g.*, at Cibyra in Caria and Gerasa in Arabia. Aristides Rhetor (*c.* 160) also relates how in the winter, which began with Tobi, the Nile water was at its purest.

Two centuries later Chrysostom, as we have seen, commends

in identical terms the water blessed and drawn from the rivers at the Baptismal feast. It is therefore probable that the Basilidian feast was a Christianized form of the blessing of the Nile, called by Chabas in his Coptic calendar *Hydreusis*. Mas'ūdī the Arab historian of the 10th century, in his *Prairies d'or* (French trans. Paris, 1863, ii., 364), enlarges on the splendours of this feast as he saw it still celebrated in Egypt.

Epiphanius also (*Haer.* 51) relates a curious celebration held at Alexandria of the Birth of the Aeon. On January 5 or 6 the votaries met in the holy compound or Temple of the Maiden (Korē), and sang hymns to the music of the flute till dawn, when they went down with torches into a shrine under ground, and fetched up a wooden idol on a bier representing Korē, seated and naked, with crosses marked on her brow, her hands and her knees. Then with flute-playing, hymns and dances they carried the image seven times round the central shrine, before restoring it again to its dwelling-place below. He adds: "And the votaries say that to-day at this hour *Korē*, that is, the Virgin, gave birth to the Aeon."

The earliest extant Greek text of the Epiphany rite is in a Euchologion of about the year 795, now in the Vatican. The prayers recite that at His baptism Christ hallowed the waters by His presence in Jordan, and ask that they may now be blessed by the Holy Spirit visiting them, by its power and inworking, as the streams of Jordan were blessed.

Volbeding (Leipzig, 1841); and K. A. H. Kellner, *Heortology* (Freiburg im Breisgau, 1906). (*See* also the works enumerated under Christmas.)

EPIPHENOMENON means a secondary appearance or by-product. The term is used to express a certain view of the relation of mind to body, or consciousness to matter. According to Huxley, Hodgson and Maudsley consciousness is just something incidental to the organism in which it occurs, and has no influence upon it—"a mere foam, aura, or melody arising from the brain, but without reaction upon it" (S. H. Hodgson, *Time and Space*). See *Body and Soul;* H. Maudsley, *Physiology and Pathology of Mind* (1867); S. H. Hodgson, *Time and Space* (1865), *The Theory of Practice* (1870).

EPIPHYTE, the term used in botany to denote those plants which grow perched upon others. Epiphytes are a characteristic feature of tropical forests. Plants of many families have become adapted to this mode of life, notably orchids (*q.v.*) A feature of epiphytes is the development of aerial roots. (*See* Root.)

EPIRUS or **EPEIRUS,** an ancient district of northern Greece extending along the Ionian Sea from the Acroceraunian promontory on the north to the Ambracian gulf on the south, and conterminous on the landward side with Illyria, Macedonia and Thessaly. It thus corresponds to the southern portion of Albania (*q.v.*). The name Epirus (Ἤπειρος) signified "mainland," and was originally applied to the whole west coast north of the Corinthian gulf, in contradistinction to the neighbouring islands. The country is mountainous, especially where the rivers Achelous, Arachthus and Aous rise in Mt. Lacmon, the backbone of Pindus. In ancient times Epirus did not produce corn sufficient for its inhabitants; but it has always been celebrated for its cattle and horses. According to Theopompus (4th cent. B.C.), the Epirots were divided into fourteen independent tribes, of which the principal were the Chaones (perhaps akin to the Chones in the heel of Italy) along the Acroceraunian shore, the Molossians inland round Lake Pambotis (mod. Jannina), and the Thesprotians north of the Ambracian gulf. In spite of distance and barbarian repute, Epirus exerted early no small influence on Greece, through the oracle of Dodona (*q.v.*). Aristotle even placed here the original home of the Hellenes. But in historic times its part is passive. Numerous Greek colonies on its coast formed stepping-stones towards the Adriatic and the West. One of the earliest and most flourishing was the Corinthian colony of Ambracia, which gives its name to the gulf. Elatria, Bucheta and Pandosia, in Thesprotia, originated from Elis. Other towns of some importance were *In Chaonia:* Palaeste and Chimaera, fortified posts to which country folk could retire in war; Onchesmus or Anchiasmus, opposite Corcyra; Phoenice, wealthiest of all, and after the fall of the Molossian kingdom the centre of an Epirote League; Buthrotum, Phanote, important in the Roman campaigns in Epirus; and Adrianopolis, named from its founder. *In Thesprotia:* Cassope, chief town of the most powerful Thesprotian clan; and Ephyra, afterwards Cichyrus. *In Molossia:* Passaron, where the kings were wont to receive their people's allegiance; and Tecmon, Phylace and Horreum. The Byzantine town of Rogus is probably the modern Luro, the Greek Oropus.

History.—The chieftains of the Molossians, who ultimately dominated all Epirus, claimed to be descended from Pyrrhus, son of Achilles, who settled here after the sack of Troy, and transmitted his kingdom to Molossus, his son by Andromache. The early history of the dynasty is obscure; but Admetus, in the 5th century B.C., is remembered for his hospitable reception of the banished Themistocles, though he had persuaded his countrymen to refuse the Molossian alliance offered when victory against the Persians was already secured. Admetus was succeeded, about 429 B.C., by his son or grandson, Tharymbas or Arymbas I., who was educated at Athens, and introduced higher civilization. A later king, Alcetas, was restored by Dionysius of Syracuse about 385 B.C. His son Arymbas II. ruled with prudence and equity, and gave encouragement to literature and the arts. To him Xenocrates of Chalcedon dedicated his four books on the art of governing; and it is specially mentioned that he bestowed great care on the education of the children of his deceased brother Neoptolemus. One of them, Troas, he married; Olympias, the other, was married to Philip II. of Macedon and became the mother of Alexander the Great. On the death of Arymbas, Alexander the brother of Olympias, was enthroned by Philip, married his daughter Cleopatra, and assumed the title of king. Asked by Tarentum for aid against the Samnites and Lucanians, he landed at Paestum in 332 B.C., and reduced several Lucanian cities, but was defeated and slain near Pandosia in Bruttium.

Aeacides, the son of Arymbas II., succeeded Alexander. He supported Olympias against Cassander, but was dethroned by his own soldiers, and fell in battle (313 B.C.) against Philip, brother of Cassander. He had, by his wife Phthia, a son, the celebrated Pyrrhus, and two daughters, Deidamia and Troas; the former married Demetrius Poliorcetes. His brother and successor, Alcetas, fought against Cassander; was put to death by his own subjects in 295 B.C., and was succeeded by Pyrrhus (*q.v.*), who for six years fought against the Romans in south Italy and Sicily, and gave to Epirus its sole moment of importance.

Alexander, his son, who succeeded in 272 B.C., defeated Antigonus Gonatas of Macedon but was himself driven from his kingdom by Demetrius. He recovered it, however, and spent the rest of his days in peace. Two other insignificant reigns brought the family of Pyrrhus to its close, and Epirus was thenceforward governed by a magistrate, elected annually in a general assembly at Passaron. Having imprudently supported Perseus (*q.v.*) in 168 B.C., it was devastated by the Romans, and never recovered. At the dissolution of the Achaean League (*q.v.*), 146 B.C., it became part of the Roman province of Macedonia, receiving the name Epirus Vetus, to distinguish it from Epirus Nova.

On the division of the empire it fell to the East, and so remained until the taking of Constantinople by the Latins in 1204, when Michel Angelus Comnenus seized Aetolia and Epirus. On the death of Michel in 1216, these countries fell into the hands of his brother Theodore. Thomas, the last of the direct line, was murdered in 1318 by his nephew Thomas, lord of Zante and Cephalonia, and his dominions were dismembered. Not long after, Epirus was overrun by Serbs and Albanians. Charles II. Tocco, lord of Cephalonia and Zante, was recognized as Despot of Epirus by the emperor Manuel Comnenus in the beginning of the 15th century; but his family was deprived in 1431 by Murad (Amurath) II. In 1443, Scanderbeg, king of Albania,

made himself master of a considerable part of Epirus; but on his death it fell to the Venetians, and from these passed to the Turks. For modern history see ALBANIA.

EPISCOPACY, the general term technically applied to that system of church organization in which the chief ecclesiastical authority within a defined district, or diocese, is vested in a bishop (from Late Lat. *episcopatus*, the office of a bishop, *episcopus*). As such it is distinguished on the one hand from Presbyterianism, government by elders, and Congregationalism, in which the individual church or community of worshippers is autonomous, and on the other from Papalism. The origin and development of episcopacy in the Christian Church, and the functions and attributes of bishops in the various churches, are dealt with elsewhere (*see* CHURCH HISTORY and BISHOP). Under the present heading it is proposed only to discuss briefly the various types of episcopacy actually existing, and the different principles that they represent.

The deepest line of cleavage is naturally between the view that episcopacy is a divinely ordained institution essential to the effective existence of a church as a channel of grace, and the view that it is merely a convenient form of church order, evolved as the result of a variety of historical causes, and not necessary to the proper constitution of a church. The first of these views is closely connected with the doctrine of the Apostolical Succession. According to this, Christ committed to his apostles certain powers of order and jurisdiction in the Church, including that of transmitting these powers to others through "the laying on of hands"; and this power, whatever obscurity may surround the practice of the primitive Church, was very early confined to the order of bishops, who by virtue of a special consecration became the successors of the apostles in the function of handing on the powers and graces of the ministry. A valid episcopate, then, is one derived in an unbroken series of "layings on of hands" by bishops from the time of the apostles (*see* ORDER, HOLY). This is the Catholic view, common to all the ancient Churches whether of the West or East, and it is one that necessarily excludes from the union of Christendom all those Christian communities which possess no such apostolically derived ministry. This high theory of episcopacy which, if certain of the Ignatian letters be genuine, has a very early origin, has, of course, fallen upon evil days. The power of the collective episcopate to maintain Catholic unity was disproved long before it was overshadowed by the centralized authority of Rome; before the Reformation, its last efforts to assert its supremacy in the Western Church, at the councils of Basel and Constance, had broken down; and the religious revolution of the 16th century left it largely discredited and exposed to a double attack, by the papal monarchy on the one hand and the democratic Presbyterian model on the other. Within the Roman Catholic Church the high doctrine of episcopacy continued to be maintained by the Gallicans and Febronians (*see* GALLICANISM and FEBRONIANISM) as against the claims of the Papacy, and for a while with success; but a system which had failed to preserve the unity of the Church even when the world was united under the Roman empire could not be expected to do so in a world split up into a series of rival states, of which many had already reorganized their churches on a national basis. "Febronius," indeed, was in favour of a frank recognition of this national basis of ecclesiastical organization, and saw in Episcopacy the best means of reuniting the dissidents to the Catholic Church, which was to consist, as it were, of a free federation of episcopal churches under the presidency of the bishop of Rome. The idea had considerable success; for it happened to march with the views of the secular princes. But the Revolution intervened; and when, during the religious reaction that followed, men sought for an ultimate authority, they found it in the papal monarch, exalted now by ultramontane zeal into the sole depositary of the apostolical tradition (*see* ULTRAMONTANISM). At the Vatican Council of 1870 episcopacy made its last stand against papalism, and was vanquished (*see* VATICAN COUNCIL). The pope still addresses his fellow-bishops as "venerable brothers"; but from the Roman Catholic Church the fraternal union of coequal authorities, which is of the essence of episcopacy, has vanished; and in its place is set the autocracy of one. The modern Roman Catholic Church is episcopal, for it preserves the bishops, whose *potestas ordinis* not even the pope can exercise until he has been duly consecrated; but the bishops as such are now but subordinate elements in a system for which "Episcopacy" is certainly no longer an appropriate term.

The word Episcopacy has, in fact, since the Reformation, been more especially associated with those churches which, while ceasing to be in communion with Rome, have preserved the episcopal model. Of these by far the most important is the Church of England, which has preserved its ecclesiastical organization essentially unchanged since its foundation by St. Augustine, and its daughter churches (*see* ENGLAND, CHURCH OF). The Church of England since the Reformation has been the chief champion of the principle of Episcopacy against the papal pretensions on the one hand and Presbyterianism and Congregationalism on the other. As to the divine origin of Episcopacy and, consequently, of its universal obligation in the Christian Church, Anglican opinion has been, and still is, considerably divided. The "High Church" view, is practically identical with that of the Gallicans and Febronians, and is based on Catholic practice anterior to the division of East and West, especially as expounded and defended by Cyprian (*q.v.*). So far as this view, however, is the outcome of the general Catholic movement of the 19th century, it can hardly be taken as typical of Anglican tradition in this matter. The whole issue has, in fact, become confused with the confusion of functions of the Church and State. According to the historic tradition of the Church of England, the ultimate governance of the Christian community, in things spiritual and temporal, was vested not in the clergy but in the "Christian prince." It was the transference to the territorial sovereigns of modern Europe of the theocratic character of the Christian heads of the Roman world-empire; with the result that for the reformed Churches the unit of church organization was no longer the diocese, or the group of dioceses, but the Christian state which could dictate its subjects' faith (*see* ENGLAND, CHURCH OF). With the constitutional changes of the 18th and 19th centuries, however, a corresponding modification took place in the character of the English episcopate; and a still further change resulted from the multiplication of colonial and missionary sees having no connection with the state. The consciousness of being in the line of apostolic succession helped the English clergy to revert to the principle *Ecclesia est in episcopo*, and the great periodical conferences of Anglican bishops from all parts of the world resemble, though they do not claim the oecumenical authority, the general councils of the early Church (*see* LAMBETH CONFERENCES).

On the survivals of Episcopacy in the Lutheran communion, *see* LUTHERAN CHURCH (especially in Scandinavia); in the Methodist Episcopal Church of America, *see* METHODISM; also articles MORAVIAN CHURCH, OLD CATHOLICS and ORTHODOX EASTERN CHURCH. On the position of Episcopacy in the Anglican and Roman communions *see* ENGLAND, CHURCH OF, and ROMAN CATHOLIC CHURCH.

EPISCOPIUS, SIMON (Simon Bischop) (1583–1643), Dutch theologian, was born at Amsterdam on Jan. 1, 1583. In 1600 he entered the university of Leiden, where he studied theology under Jacobus Arminius. In 1610, the year in which the Arminians presented the famous Remonstrance to the states of Holland, he became pastor at Bleyswick, near Rotterdam; in the following year he supported the Remonstrants (*q.v.*) at the Hague conference. In 1612 he was made professor of theology at Leiden. Episcopius was spokesman of the thirteen representatives of the Remonstrants before the synod of Dort in 1618; but he was refused a hearing, the Remonstrant doctrines condemned and he and the other Arminian representatives banished (*see* DORT, SYNOD OF). After the death (1625) of Prince Maurice, the Arminian controversy abated and Episcopius was permitted in 1626 to return to his own country. He was appointed preacher at the Remonstrant college in Amsterdam. Episcopius may be regarded as the

systematizer of Arminianism. He protested against the tendency of Calvinists to stress abstract dogma, and argued that Christianity was practical rather than theoretical.

His principal works are *Confessio s. declaratio sententiae pastorum qui in foederato Belgio Remonstrantes vocantur* (1621), *Apologia pro confessione* (1629), *Verus theologus remonstrans*, and his incomplete *Institutiones theologicae* (1650). His life was written by P. Limborch, and one was also prefixed by his successor, Curcellaeus, to an edition of his collected works in 2 vols. (1650–65). *See* Herzog-Hauck, *Realencyklopädie.*

EPISODE, an incident occurring in the history of a nation, an institution or an individual, especially with the significance of being an interruption of an ordered course of events. The word is derived from a word (ἐπείσοδος) with a technical meaning in ancient Greek tragedy. It is defined by Aristotle (*Poetics*, 12) as μέρος ὅλον τραγῳδίας τὸ μεταξὺ ὅλων χορικῶν μελῶν, all the scenes; that is, which fall between the choric songs. (εἴσοδος), or entrance, is generally applied to the entrance of the chorus, but the reference may be to that of the actors at the close of the choric songs. In early Greek tragedy the parts spoken by the actors were considered of subsidiary importance to those sung by the chorus, and it is from this aspect that the meaning of the word, as something which breaks off the course of events, is derived.

See A. E. Haigh, *The Tragic Drama of the Greeks*, p. 353 (1896).

In music, episode is a more or less distinctive but subordinate section of an instrumental work serving to impart variety and interest to the general design. Beethoven raised the episode to its highest point as an element of sonata form, though in the case of fugues the value of such accessory sections had been recognized long previously.

EPISTAXIS, the medical term for bleeding from the nose. It is common and usually of little importance in childhood. But it may be symptomatic of haemophilia (bleeders) when probably it will be necessary to apply styptics or plug the nostrils. In middle age it may indicate arterio-sclerosis and high arterial tension and then the bleeding is salutary. Epistaxis also occurs in fracture of the base of the skull.

EPISTEMOLOGY, in philosophy, a term applied, probably first by J. F. Ferrier, to that department of thought whose subject matter is the nature and validity of knowledge (Gr. ἐπιστήμη, knowledge, and λόγος, theory, account; Ger. *Erkenntnistheorie*). It is thus contrasted with metaphysics, which considers the nature of reality, and with psychology, which deals with the objective part of cognition, and, as Prof. James Ward said, "is essentially genetic in its method." Epistemology is concerned rather with the possibility of knowledge in the abstract. In the evolution of thought epistemological inquiry succeeded the speculations of the early thinkers, who concerned themselves primarily with attempts to explain existence. The differences of opinion which arose on this problem naturally led to the inquiry as to whether any universally valid statement was possible. The Sophists and the Sceptics, Plato and Aristotle, the Stoics and the Epicureans took up the question, and from the time of Locke and Kant it has been prominent in modern philosophy. It is extremely difficult, if not impossible, to draw a hard and fast line between epistemology and other branches of philosophy. If, for example, philosophy is divided into the theory of knowing and the theory of being, it is impossible entirely to separate the latter (Ontology) from the analysis of knowledge (Epistemology), so close is the connection between the two. Again, the relation between logic in its widest sense and the theory of knowledge is extremely close. Some thinkers have identified the two, while others regard Epistemology as a subdivision of logic; others demarcate their relative spheres by confining logic to the science of the laws of thought, *i.e.*, to formal logic. An attempt has been made by some philosophers to substitute "Gnosiology" (Gr. γνῶσις) for "Epistemology" as a special term for that part of Epistemology which is confined to "systematic analysis of the conceptions employed by ordinary and scientific thought in interpreting the world, and including an investigation of the art of knowledge, or the nature of knowledge as such." "Epistemology" would thus be reserved for the broad questions of "the origin, nature and limits of knowledge" (Baldwin's *Dict. of Philos.* i. pp. 333 and 414). The term Gnosiology has not, however, come into general use. (*See* PHILOSOPHY; KNOWLEDGE, THEORY OF.)

EPISTLE, in its primary sense any letter addressed to an absent person. At the present day the term is used only for letters of an ancient time, or for elaborate literary productions which are, or affect to be, written to a person at a distance.

Epistles and Letters.—A broad distinction exists between the letter and the epistle. The letter is essentially a spontaneous, non-literary production, personal and private, a substitute for a spoken conversation. The epistle, on the other hand, rather takes the place of a public speech, it is written with an audience in view, it is a literary form, a distinctly artistic effort aiming at permanence.

Both letters and epistles have come down to us in considerable variety and extent from the ancient world. Babylonia and Assyria, Egypt, Greece and Rome alike contribute to our inheritance of letters. Those of Aristotle are of questionable genuineness, but we can rely, at any rate in part, on those of Isocrates and Epicurus. Some of the letters of Cicero are rather epistles, since they were meant ultimately for the general eye. The epistles of Dionysius of Halicarnassus, Plutarch, Seneca and the younger Pliny claim mention at this point. In the later Roman period and into the middle ages, formal epistles were almost a distinct branch of literature. The 10 books of Symmachus's *Epistolae*, so highly esteemed in the cultured circles of the 4th century, may be contrasted with the less elegant but more forceful epistles of Jerome.

The distinction between letters and epistles has particular interest for the student of early Christian literature. G. A. Deissmann (*Bible Studies*) assigns to the category of letters all the Pauline writings as well as 2 and 3 John. The books bearing the names of James, Peter, and Jude, together with the Pastorals and the Apocalypse, he regards as epistles. The first epistle of John he calls less a letter or an epistle than a religious tract. It is doubtful, however, whether we can thus reduce all the letters of the New Testament to one or other of these categories. We have a particularly interesting form of epistle in the communications between churches (as distinct from individuals) known as the *First Epistle of Clement* (Rome to Corinth), the *Martyrdom of Polycarp* (Smyrna to Philomelium), and the *Letters of the Churches of Vienne and Lyons* (to the congregations of Asia Minor and Phrygia) describing the Gallican martyrdoms of A.D. 177. In the following centuries we have the valuable epistles of Cyprian, of Gregory Nazianzen (to Cledonius on the Apollinarian controversy), of Basil, Ambrose, Chrysostom, Augustine and Jerome.

In the Renaissance one of the most common forms of literary production was that modelled upon Cicero's letters. From Petrarch to the *Epistolae obscurorum virorum* there is a whole epistolary literature. The *Epistolae obscurorum virorum* have to some extent a counterpart in the Epistles of Martin Marprelate. Later satires in an epistolary form are Pascal's *Provincial Letters*, Swift's *Drapier Letters*, and the *Letters of Junius*. The "open letter" of modern journalism is really an epistle.

Epistles in Poetry.—A branch of poetry bears the name of the Epistle, and is modelled on those pieces of Horace which are almost essays on moral or philosophical subjects, and are chiefly distinguished from other poems by being addressed to particular patrons or friends. Examples of the work in this direction of Ovid, Claudian, Ausonius and other late Latin poets have been preserved, but it is particularly those of Horace which have given this character to the epistles in verse which form so very characteristic a section of French poetry. Clément Marot, in the 16th century, first made the epistle popular in France. Boileau's epistles, 12 in number, are the classic examples of this form of verse in French literature; they were composed at different dates between 1668 and 1695. In the 18th century Voltaire enjoyed a supremacy in this graceful and sparkling species of writing; the *Epître à Uranie* is perhaps the most famous of his verse-letters.

In England the verse-epistle was first prominently employed by Samuel Daniel in his "Letter from Octavia to Marcus Antonius" (1599), and later on, more legitimately, in his "Certain Epistles" (1601–03). His letter, in *terza rima*, to Lucy, Countess of Bristol, is one of the finest examples of this form in English literature. It was Daniel's deliberate intention to introduce the Epistle into

English poetry, "after the manner of Horace." He was supported by Ben Jonson, who has some fine Horatian epistles in his *Forests* (1616) and his *Underwoods*. *Letters to Several Persons of Honour* form an important section in the poetry of John Donne. At the close of the 17th century Dryden greatly excelled in this class of poetry, and his epistles to Congreve (1694) and to the duchess of Ormond (1700) are among the most graceful and eloquent that we possess. During the age of Anne various Augustan poets essayed the epistle with more or less success, and it was employed by Gay for several exercises in his elegant persiflage. But the great writer of epistles in English is Pope. The "Epistle to Dr. Arbuthnot" has not been surpassed, if equalled, in Latin or French poetry of the same class. After the day of Pope the epistle again fell into desuetude, or occasional use, in England. It revived in the charming naïveté of Cowper's lyrical letters in octosyllabics to his friends, such as William Bull and Lady Austin (1782). At the close of the century Samuel Rogers endeavoured to resuscitate the neglected form in his "Epistle to a Friend" (1798). Shelley's "Letter to Maria Gisborne" (1820), Keats's "Epistle to Charles Clarke" (1816), and Landor's "To Julius Hare" (1836), in spite of their romantic colouring, are genuine Horatian epistles and of the pure Augustan type. This type, in English literature, is commonly, though not at all universally, cast in heroic verse. But Daniel employs *rime royale* and *terza rima*, while some modern epistles have been in iambic rhymed measures or in blank verse.

For St. Paul's Epistles *see* PAUL, for St. Peter's *see* PETER, for Apocryphal Epistles *see* APOCRYPHAL LITERATURE, for Plato's *see* PLATO, etc.

EPISTYLE, the Greek term for architrave, the lower member of the entablature of the classic orders (*q.v.*).

EPITAPH, strictly an inscription upon a tomb, though by a natural extension of usage, the name is applied to anything written ostensibly for that purpose, whether actually on a tomb or not.

Probably the earliest epitaphial inscriptions that have come down to us are those of the ancient Egyptians, written, as their mode of sepulture necessitated, upon the sarcophagi and coffins. Those that have been deciphered are all very much in the same form, commencing with a prayer to a deity, generally Osiris or Anubis, on behalf of the deceased, whose name, descent and office are usually specified. Ancient Greek epitaphs, unlike the Egyptian, are of great literary interest, deep and often tender in feeling, rich and varied in expression, and generally epigrammatic in form. They are written usually in elegiac verse, though many of the later epitaphs are in prose. Among the gems of the Greek anthology familiar to English readers through translations are the epitaphs upon those who had fallen in battle. There are several ascribed to Simonides on the heroes of Thermopylae, of which the most celebrated is the epigram:

> Go tell the Spartans, thou that passest by,
> That here, obedient to their laws, we lie.

In Sparta epitaphs were inscribed only upon the graves of those who had been especially distinguished in war; in Athens they were applied more indiscriminately.

Roman epitaphs, in contrast to those of the Greeks, contained as a rule, nothing beyond a record of facts. The inscriptions on the urns, of which numerous specimens are to be found in the British Museum, present but little variation. The letters D.M. or D.M.S (Diis Manibus or Diis Manibus Sacrum) are followed by the name of the person whose ashes are enclosed, his age at death, and sometimes one or two other particulars. It is a curious illustration of the survival of traces of an old faith after it has been formally discarded to find that the letters D.M. are not uncommon on the Christian inscriptions in the catacombs.

Inscriptions usually began with the appropriate words *Siste Viator* or *Aspice Viator*, the origin doubtless of the "Stop Passenger" which still meets the eye in many parish churchyards of Britain. Another phrase of very common occurrence on Ancient Roman tombstones, *Sit tibi terra levis* ("Light lie the earth upon thee"), has continued in frequent use down to modern times. A remarkable feature of many of the Roman epitaphs was the denunciation they often pronounced upon those who violated the sepulchre. Such denunciations were not uncommon in later times. A well-known instance is the lines on Shakespeare's tomb at Stratford-on-Avon, said to have been written by the poet himself:

> Good frend, for Jesus' sake forbeare
> To digg the dust enclosed heare;
> Blest be y^e^ man y^t^ spares thes stones,
> And curst be he y^t^ moves my bones.

The earliest existing British epitaphs belonged to the Roman period, and are written in Latin after the Roman form. Specimens are to be seen in various museums throughout the country; some of the inscriptions are given in Bruce's *Roman Wall*, and the seventh volume of the *Corpus Inscriptionum Latinarum* edited by Hubner, containing the British inscriptions, is a valuable repertory for the earlier Roman epitaphs in Britain. The earliest, of course, are commemorative of soldiers belonging to the legions of occupation, but the Roman form was afterwards adopted for native Britons. It is only in fact within recent years that Latin has become unusual and the more natural practice has been adopted of writing the epitaphs of distinguished men in the language of the country in which they lived. The comparatively few English epitaphs that remain of the 11th and 12th centuries are all in Latin. In the 13th century French began to be used in writing epitaphs and most of the inscriptions to celebrated historical personages between 1200 and 1400 are in that language. Mention may be made of those to Robert the 3rd earl of Oxford (d. 1221) as given in Weever, to Henry III. (d. 1272) at Westminster Abbey, and to Edward the Black Prince (d. 1376) at Canterbury.

The epitaph almost invariably closes with a request, sometimes very urgently worded, for the prayers of the reader that the soul of the deceased may pass to glory, and an invocation of blessing, general or specific, upon all who comply. Epitaphs preserved much of the same character after English began to used towards the close of the 14th century. The following, to a member of the Savile family at Thornhill, is probably even earlier:

> Bonys emongg stonys lys ful
> steyl gwylste the sawle wan-
> deris were that God wylethe

that is, Bones among stones lie full still, whilst the soul wanders whither God willeth. It may be noted that most inscriptions, Latin and English, from 1300 to the Reformation, that have been preserved, are upon brasses (*see* BRONZE).

It was in the reign of Elizabeth that epitaphs in English began to assume a distinct literary character and value, entitling them to rank with those that had hitherto been composed in Latin. We learn from Nash that at the close of the 16th century it had become a trade to supply epitaphs in English verse. One of the finest epitaphs in English is that by Milton upon Shakespeare.

The epitaphs of Pope are still considered to possess very great literary merit, though they were rated higher by Johnson and critics of his period than they are now.

Dr. Johnson, who thought so highly of Pope's epitaphs, was himself a great authority on both the theory and practice of this species of composition. His essay on epitaphs is one of the few existing monographs on the subject, and his opinion as to the use of Latin had great influence. The manner in which he met the delicately insinuated request of a number of eminent men that English should be employed in the case of Oliver Goldsmith was characteristic and showed the strength of his conviction.

In classifying epitaphs various principles of division may be adopted. Arranged according to nationality they indicate distinctions of race less clearly perhaps than any other form of literature does. At the same time the influence of nationality may to some extent be traced in epitaphs. The characteristics of the French style, its grace, clearness, wit and epigrammatic point, are all recognizable in French epitaphs. In the 16th century those of Étienne Pasquier were universally admired. Instances such as Piron's epitaph written for himself after his rejection by the French Academy:

> Ci-gît Piron, qui ne fut rien,
> Pas même académicien

and one by a relieved husband, to be seen at Père Lachaise—

> Ci-gît ma femme, Ah! qu'elle est bien
> Pour son repos et pour le mien

might be multiplied indefinitely. One can hardly look through a collection of English epitaphs without being struck with the fact that these represent a greater variety of intellectual and emotional states than those of any other nation.

Epitaphs are sometimes classified according to their authorship and sometimes according to their subject, but neither division is so interesting as that which arranges them according to their characteristic features. What has just been said of English epitaphs is, of course, more true of epitaphs generally. They exemplify every variety of sentiment and taste, from lofty pathos and dignified eulogy to coarse buffoonery and the vilest scurrility.

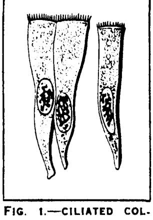

FIG. 1.—CILIATED COLUMNAR EPITHELIAL CELLS, HIGHLY MAGNIFIED, FROM THE INTESTINE OF A FROG

EPITHALAMIUM, originally among the Greeks a song in praise of bride and bridegroom, which was sung by a number of boys and girls at the door of the nuptial chamber. According to the scholiast on Theocritus, one form, the *κατακοιμητικόν*, was employed at night, and another, the *διεγερτικόν*, to arouse the bride and bridegroom on the following morning. Among the Romans a similar custom was in vogue, but the song was sung by girls only. In the hands of the poets the epithalamium was developed into a special literary form and received considerable cultivation. Sappho, Anacreon, Stesichorus and Pindar are all regarded as masters of the species, but the finest example preserved in Greek literature is the 18th Idyll of Theocritus, which celebrates the marriage of Menelaus and Helen. In Latin, the epithalamium, imitated from Fescennine Greek models, was a base form of literature, when Catullus redeemed it and gave it dignity by modelling his *Marriage of Thetis and Peleus* on a lost ode of Sappho. The names of Ronsard, Malherbe and Scarron are especially associated with the species in French literature, and Marini and Metastasio in Italian. Perhaps no poem of this class has been more universally admired than the *Epithalamium* of Spenser (1595), though he has found not unworthy rivals in Ben Jonson, Donne and Quarles.

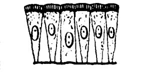

FIG. 2.—COLUMNAR EPITHELIAL CELLS, CILIATED, RESTING ON A BASEMENT MEMBRANE. HIGHLY MAGNIFIED

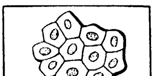

FIG. 3.—MOSAIC APPEARANCE OF COLUMNAR EPITHELIUM AS SEEN FROM ABOVE. MAGNIFIED

EPITHELIUM, in anatomy. Every surface of the body which may come into contact with foreign substances is covered with a protecting layer of cells closely bound to one another to form continuous sheets. By the formation of outgrowths or ingrowths from these surfaces, structures, consisting largely or entirely of cells directly derived from the surface epithelium, may be formed. In this way originate the central nervous system, the sensitive surfaces of the special sense organs, the glands, and the hairs, nails, etc. The epithelial cells possess typical microscopical characters which enable them to be readily distinguished from all others. Thus the cell outline is clearly marked, the nucleus large and spherical or ellipsoidal. The protoplasm of the cell is usually large in amount and often contains large numbers of granules.

Varieties.—The cells forming an epithelial membrane may be *flattened,* or *squamous, cubical, columnar, irregular, ciliated* or *flagellated.* The membranes formed by these cells may be only one cell thick, as in the major part of the alimentary canal, or consist of several layers of cells, as in the epidermis of the skin.

1. *Columnar Epithelium* (figs. 1 and 2).—This variety covers the intestinal tract from the end of the oesophagus to the commencement of the rectum. It also lines the ducts of many glands. In a highly typical form it covers the villi of the small intestine (fig. 1). The close apposition of these cells to form a closed membrane is well seen when a surface covered by them is examined from above (fig. 3).

2. *Cubical Epithelium.*—This differs from the former in that the cells are less in height. It is found in many glands and ducts (*e.g.* the kidney), in the middle ear, choroid plexuses of the brain, etc.

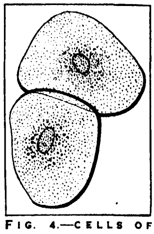

FIG. 4.—CELLS OF SQUAMOUS EPITHELIUM FROM THE MOUTH. HIGHLY MAGNIFIED

3. *Squamous or Flattened Epithelium* (fig. 4).—In this variety the cell is flattened, very thin and irregular in outline. It occurs as the covering epithelium of the alveoli of the lung, of the kidney glomerules and capsule, etc. The surface epithelial cells of a stratified epithelium are also of this type.

4. *Ciliated Epithelium* (fig. 5).—The surface cells of many epithelial membranes carry fine protoplasmic processes or *cilia.* Most commonly the cells are columnar, but other shapes are also found. During life the cilia are always in movement, and set up a current tending to drive fluid or other material on the surface in one direction along the membrane or tube lined by such epithelium. Ciliated epithelium lines the trachea, bronchi, parts of the nasal cavities and the uterus, oviduct, vas deferens, epididymis, etc. If there be but a single process from the exposed surface of the cell it is usually large and long, and is known as a *flagellum.* Such cells are common on the surface of many simple animal organisms.

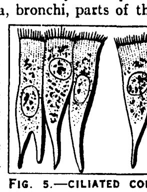

FIG. 5.—CILIATED COLUMNAR EPITHELIUM CELLS FROM TRACHEA. HIGHLY MAGNIFIED

When the cells of an epithelial surface are arranged several layers deep, we can again distinguish various types:

5. *Stratified Epithelium* (figs. 6 and 7).—This is found in the epithelium of the skin and of many mucous membranes (mouth, oesophagus, rectum, conjunctiva, vagina, etc.). Here the surface cells are very much flattened, those of the middle layer are polyhedral and those of the lowest layer are cubical or columnar. This type of epithelium covers surfaces exposed to friction. The surface may be dry, *e.g.*, skin, or moist, *e.g.*, mouth. The surface cells are constantly being rubbed off, and are replaced by new cells growing up from below. Hence the deepest layer is formative and in successive stages from this we can trace the gradual transformation of these protoplasmic cells into scaly cells, which no longer show any sign of being alive. In the moist mucous surfaces the number of cells forming the epithelial layer is usually much smaller than in a dry stratified epithelium.

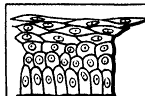

FIG. 6.—STRATIFIED EPITHELIUM FROM A MUCOUS MEMBRANE. HIGHLY MAGNIFIED

6. *Stratified Ciliated Epithelium.*—In this variety the superficial cells are ciliated and columnar; between the bases of these are found fusiform cells and the lowest cells are cubical or pyramidal. This epithelium lines parts of the respiratory passages, the vas deferens and the epididymis.

7. *Transitional Epithelium* (fig. 8).—This variety of epithelium lines the urinary bladder, and its appearance depends upon the contracted or distended state of the bladder from which the preparation was made. If the bladder was contracted the form seen in fig. 8 is obtained. The epithelium is in three or more layers, the superficial one being very characteristic. The cells are cubical

and fit over the rounded ends of the cells of the next layer. These are pear-shaped, the points of the pear resting on the basement membrane. Between the bases of these cells lie those of the lowermost layer. These are irregularly columnar. If the bladder is distended before the preparation is made, the cells are stretched transversely. The surface cells then become very flattened.

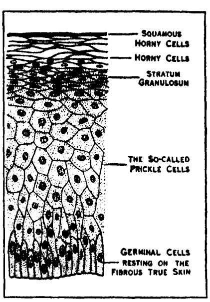

FIG. 7.—STRATIFIED SQUAMOUS EPITHELIUM OF SKIN, HIGHLY MAGNIFIED, SHOWING KINDS OF CELLS

Considering epithelium from the point of view of function, it may be protective, absorptive or secretory. It may produce special outgrowths (hairs, nails, horns, etc.), and for such purposes it may manufacture within itself chemical material best suited for that purpose, *e.g.* keratin; here the whole cell becomes modified. In other instances it contains fat droplets, granules of various kinds, protein, mucin, watery granules or glycogen, etc. In a typical absorbing cell granules of material being absorbed may be seen. A secreting cell of normal type forming specific substances stores these in its interior until wanted, *e.g.*, fat as in sebaceous and mammary glands, ferment precursors (salivary, gastric glands, etc.), and various excretory substances, as in the renal epithelium (*see* GLAND).

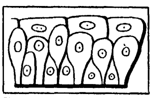

FIG. 8.—TRANSITIONAL EPITHELIUM FROM THE URINARY BLADDER. HIGHLY MAGNIFIED

EPITOME, an abridgment, abstract or summary giving the salient points of a book, law case, etc., a short and concise account of any particular subject or event. By transference *epitome* is also used to express the representation of a larger thing, concrete or abstract, reproduced in miniature. Thus St. Mark's was called by Ruskin the "Epitome of Venice," as it embraces examples of architecture from the 10th to the 19th centuries.

EPITROCHOID: *see* CURVES, SPECIAL.

EPOCH, a term for a stated period of time, and so used of a date accepted as the starting-point of an era or of a new period in chronology, such as the birth of Christ (Gr. ἐποχή, holding in suspense, a pause, from ἐπέχειν, to hold up, to stop). It is hence transferred to a period which marks a great change, whether in the history of a country or a science, such as a great discovery or invention. Thus an event may be spoken of as "epoch-making." The word is also used, synonymously with "period," for any space of time marked by a distinctive condition or series of events.

In astronomy the word is used for a moment from which time is measured, or at which a definite position of a body or a definite relation of two bodies occurs. For example, the position of a body moving in an orbit cannot be determined unless its position at some given time is known. The given time is then the epoch; but the term is often loosely used for "mean longitude at the epoch."

EPODE, a Greek ode, and (according to some authorities) elaborated by Stesichorus, and as exhibited, *e.g.*, in the plays and in Pindar, was based on a system of strophe, antistrophe (these exactly corresponding) and a concluding epode (ἐπῳδὸς περίοδος); a system which the reader may see quite fairly represented in Gray's *Bard* and *Progress of Poesy.* At the conclusion of the antistrophe the two halves of the chorus are said to have combined and sung the epode together (or, in certain cases, to have left it to the *coryphaeus* or leader). Though the Latins found Pindar impossible of imitation, certain poems of Catullus and Horace bear a rough resemblance to this form. It must be distinguished from the epode of Archilochus, in which (as a rule) the iambic was used as a vehicle of satire. This class is best known from Horace's *Epodon Liber,* written in confessed dependence on Archilochus, and, like its model, sarcastic and often coarse. It is this class, so different from the genuine epode of Sophocles and Pindar, that has almost appropriated the name.

EPONA. As her name implies (*epo-*, Gallic equivalent of Latin *equo-*), this goddess was patroness of horses, but also of asses and mules. The majority of inscriptions and images bearing her name have been found in Gaul, Germany and the Danube countries; of the few that occur in Rome most were exhumed on the site of the barracks of the *equites singulares,* a foreign imperial bodyguard recruited mainly from the Batavians. Her cult does not appear to have been introduced into Rome before imperial times, when she is often called Augusta and invoked on behalf of the emperor and the imperial house. The Romans used to place the image of the goddess, crowned with flowers on festive occasions, in a sort of shrine in the centre of the architrave of the stable. In art she is generally represented seated, with her hand on the head of the accompanying horse or ass.

See articles in Daremberg and Saglio's *Dict. des antiquités* and Pauly-Wissowa's *Realencyklopädie.*

EPONYMOUS (Gr. ἐπώνυμος [ὄνομα, a name]), a word originally meaning "given as a name" or "named after" a person or thing, and coming in time to mean "that which gives a name" to a person or thing, a term especially applied to the mythical or semi-mythical personages, heroes, deities, etc., from whom a country or city took its name. Thus Pelops is the giver of the name to the Peloponnese. At Athens the chief archon (*q.v.*) of the year was known as the ἄρχων ἐπώνυμος, as the year was known by his name.

EPPING, a market town in the Epping parliamentary division of Essex, England, 17m. N.N.E. from London on the Chipping Ongar branch of the L.N.E. railway. Pop. of urban district (1921), 4,196. The town lies high and picturesquely situated at the northern outskirts of Epping forest. In 1889 the modern church of St. John the Baptist took the place as parish church of the old parish church of All Saints, Epping Upland, 2m. N.W.

Epping forest forms part of the ancient Waltham forest or great forest of Essex (*q.v.*), which once covered the greater part of the county. Disafforestation had already begun at an early date, and in the 17th century a royal commission estimated the area at 60,000 acres. The forest became one of the commonable lands of royal chases or hunting-grounds. But the various encroachments and enclosures, especially from the end of the 18th century (*see* COMMONS), having threatened total obliteration, at the instance of the corporation of the City of London, a board of commissioners was appointed (under the Epping Forest Act of 1871), and eventually the corporation purchased the freehold interest of waste land, and secured some 5,600 ac., magnificently timbered, to the use of the public for ever. The tract was declared open in 1882. The ancient Court of Verderers was also revived, and the guardianship of the forest entrusted to a chief ranger, verderers, keepers, and the parish reeves representing the parishes on its outskirts. The present forest lies between the valleys of the Roding and the Lea, and extends southward from Epping for about 7 miles. It is readily traversed from the villages on its outskirts, such as Woodford, Chingford and Loughton, which are served by railway, and is a favourite resort of Londoners in the summer.

EPPS, the name of an English family, well known in commerce and medicine. In the second half of the 18th century they had been settled near Ashford, Kent, for some generations, claiming descent from an equerry of Charles II., but were reduced in circumstances, when JOHN EPPS rose to prosperity as a provision merchant in London, and restored the family fortunes. He had four sons, of whom JOHN EPPS (1805–1869), GEORGE NAPOLEON EPPS (1815–1874) and JAMES EPPS (1821–1907) were notable men of their day, the two former as prominent doctors who were ardent converts to homoeopathy, and James as a homoeopathic chemist and the founder of the great cocoa business associated with his name. Among Dr. G. N. Epps's children were Dr. Washington Epps, a well known homoeopathist, Lady Alma-Tadema and Lady Gosse.

ÉPRÉMESNIL (ESPRÉMESNIL or ÉPRÉMÉNIL), **JEAN JACQUES DUVAL D'** (1745–1794), French magistrate and

politician, was born in India on Dec. 5, 1745 at Pondicherry, his father being a colleague of Dupleix. He studied law in Paris, and became in 1775 *conseiller* in the parlement of Paris, where he defended the rights of the parlement against the royal prerogative. On Nov. 19, 1787 he was the spokesman of the parlement in demanding the convocation of the states-general. A royal officer was sent to the palais de justice to arrest Éprémesnil and his chief supporter Goislard de Montsabert, but the parlement (May 5, 1788) declared that they were all Éprémesnils, and the arrest was only effected on the next day on the voluntary surrender of the two members. After four months' imprisonment on the island of Ste. Marguerite, Éprémesnil was returned to the states-general as deputy of the nobility of the outlying districts of Paris. But with the rapid advance towards revolution his views changed; in his *Réflexions impartiales* . . . (Jan. 1789) he defended the monarchy, and he led the party among the nobility that refused to meet with the third estate until summoned to do so by royal command. He was imprisoned for a short time in 1792. In Sept. 1793 he was arrested at Le Havre and denounced to the Convention as an agent of Pitt. He was brought to trial before the revolutionary tribunal in Paris on April 21, 1794, and was guillotined the next day.

D'Éprémesnil's speeches were collected in a small volume in 1823. *See* also H. Carré, *Un Précurseur inconscient de la Révolution* (1897).

EPSOM, a town of Surrey, England, on the edge of Banstead Downs, 15 m. S.W. by S. of London, on the main road to Dorking, with stations (including Epsom Downs and Tattenham Corner, on the racecourse) on the S.R. Pop. of urban district (1921) 18,804. The parish church of St. Martin is a modern Gothic restoration. Epsom (a contraction of Ebbisham, the name of the old manor) first came into notice when mineral springs were discovered there about 1618 and as a spa reached its zenith a century later. Horse races appear to have been established here as early as James I.'s residence at Nonsuch, but they did not assume a permanent character until 1730. The principal races—the Derby and the Oaks, named after the twelfth earl of Derby and his seat, the Oaks, in the neighbourhood—were established in 1780 and 1779 respectively. The spring races (which include the Metropolitan and the City and Suburban) are held towards the close of April; while the great Epsom meeting takes place on the Tuesday and three following days immediately before Whitsuntide,—the Derby on the Wednesday, and the Oaks on the Friday (*see* HORSE-RACING). The grandstand was first erected in 1829, and subsequently enlarged; there are numerous training stables and several well known residences in the vicinity. Close to the town are the extensive buildings of Epsom college, founded in 1855, which by the terms of the foundation grants scholarships to the sons of medical men. Epsom Downs (387·5 ac.) and Epsom Common (435·5 ac.) have been common land from time immemorial. The council also maintains recreation grounds, and owns the water and electricity supplies and certain of the stables. The urban district and certain parishes in the rural district fall within the metropolitan police district of Greater London.

EPSOM SALTS, familiar as small, colourless, needle-shaped crystals which appear white if powdered, heptahydrated magnesium sulphate, $MgSO_4 \cdot 7H_2O$, the *magnesii sulphas* of pharmacy (Ger. *Bittersalz*). It occurs dissolved in sea water and in most mineral waters, especially in those at Epsom (from which place it takes its name), Seidlitz, Saidschutz and Pullna. It also occurs in nature in fibrous excrescences, constituting the mineral epsomite or hairsalt; and as compact masses (reichardite), as in the Stassfurt mines. It is also found associated with limestone, as in the Mammoth Cave, Kentucky, or with gypsum, as at Montmartre. Epsom salts form orthorhombic crystals, being isomorphous with the corresponding zinc and nickel sulphates, and also with magnesium chromate. It is used in the arts for weighting cotton fabrics, as a top dressing for clover hay in agriculture, and in dyeing. In medicine it is frequently employed as a hydragogue purgative, specially valuable in febrile diseases, in congestion of the portal system, and in the obstinate constipation of painters' colic. In the last case it is combined with potassium iodide, the two salts being exceedingly effective in causing the elimination of lead from the system. It is also very useful as a supplement to mercury, which needs a saline aperient to complete its action. It possesses the advantage of exercising but little irritant effect upon the bowels. Its nauseous bitter taste may to some extent be concealed by acidifying the solution with dilute sulphuric acid, and in some cases where full doses have failed the repeated administration of small ones has proved effectual. (*See* MAGNESIUM.)

EPSTEIN, JACOB (1880–), sculptor, was born in New York, on Nov. 10, 1880, the son of Russian-Polish parents. He received his early training at the School of the Art Students league of New York, and in 1902 he worked for a time at the École des Beaux-Arts in Paris. He went to London in 1905, and three years later obtained the commission to decorate the front of the British Medical Association building in the Strand, for which he made 18 large figures. In 1909 he carved the large sphinx for the Oscar Wilde memorial, placed in the Père Lachaise cemetery in Paris in 1912. His next works—the marble group "Two Doves" (1913), the marble Venus (1914) and his interesting carvings in flenite—belong to his period of experiment in "abstract" sculpture. The life-sized bronze figure of Christ roused the storm of opposition which has signalized the appearance of each of the sculptor's most important works.

His series of bronze portraits, in which he may be said to have obtained his greatest success, began in 1907 with the portrait of Mrs. McEvoy. This was followed by the portrait of Lord Fisher in the Imperial War museum (1915), a mask of Mrs. Jacob Epstein (1916), the half-length "Meum with a Fan" and the "Duchess of Marlborough" (1917), a bust of Mrs. Jacob Epstein (1918), Hélène (1919), the "Girl from Senegal," "Kathleen" and "Jacob Kramer" in the National Gallery of British art (1921), the "Weeping Woman" and "Dolores" (1922), Ferosa Rastourmji, R. B. Cunninghame Graham and "Old Pinager" (1923), Joseph Conrad (1924), "Sunita" and Sybil Thorndike (1925). His Hudson memorial in Hyde park—a panel carved with a figure of Rima—was unveiled in 1925. Exhibitions of the sculptor's works were held at the Leicester galleries, London, in 1917, 1920 and 1924. In the fall of 1927 Epstein came to America for work in New York and in other cities of the United States. The Ferargil galleries in New York held an exhibit of his work at that time, and another was held early in 1928 at the Art Students league. *The Nation* (New York) included his name in its honour roll for 1927 "for the strange beauty of his creations." (*See* SCULPTURE.)

See Bernard van Dieren, *Epstein* (1920); also the volume devoted to the sculptor in the "Contemporary British Artists" series (1925).

EQUATION OF THE CENTRE, in astronomy, the angular distance, measured around the centre of motion, by which a planet moving in an ellipse deviates from the mean position which it would occupy if it moved uniformly. Its amount is the correction which must be applied positively or negatively to the mean anomaly in order to obtain the true anomaly. It arises from the ellipticity of the orbit, is zero at pericentre and apocentre, and reaches a maximum nearly midway between these. (*See* ORBIT.)

EQUATION OF TIME, the difference between apparent time (*e.g.*, by a sun-dial) and mean time (by a standard clock). The earth rotates on its axis in 23h. 56m.; the interval from noon to noon is 24h. om. the extra 4m. being occupied in "catching up" the sun, which has moved on in the sky since it must make a complete circuit in a year. This 4m. (strictly 3m. 55·91s) is an average allowance; the sun moves sometimes faster, sometimes slower, reflecting the varying motion of the earth in its elliptic orbit. The motion is fastest at time of perihelion (Jan. 3); accordingly at that time of the year the clock allowance is insufficient, and apparent noon by the actual sun becomes later and later according to the uniform clock. It is for this reason that after the shortest day the afternoons lengthen faster than the mornings. Another cause of difference between the sun and the clock is the inclination of the ecliptic (the sun's track in the sky) to the equator. The two causes combined give the following average values for different dates. The + sign means that the sun passes the meridian *after* mean noon; the − sign *before* mean noon.

EQUATIONS, THEORY OF. An equation is the statement of an equality between one or more unknown numbers and known, or given, numbers, which is true, not for all values of the unknowns, but only for certain of them (Lat. *aequatio*, an equalizing). An equality which holds for all values of the unknowns is an identity. Thus $3x+2=5$, true only for $x=1$, is an equation; $x^2-y^2=(x+y)(x-y)$, holding for all values of x, y, is an identity. To distinguish identities from equations the symbol $\equiv$ is used, as in $x^2-y^2\equiv(x+y)(x-y)$. This symbol will also be used, where no confusion can arise, to signify a definition; thus $x\equiv a$ means x is a.

The earliest known equivalents of algebraic equations occur in the Rhind papyrus, evidently compiled from earlier works, by the Egyptian Ahmes, about 1650 or 1700 B.C. For example, he proposes this problem:—"A quantity and its seventh added together become 19. What is the quantity?" His word for the unknown is *'aha'* or *'ḥ'*, formerly written *hau* and translated "heap" or "mass." The problem, therefore, is to solve the equation $x+\frac{1}{7}x=19$, as we would now express it. Lacking a convenient algebraic notation, he proceeded by a cumbersome method later known as that of "false position." Indeed, neither the Egyptians nor their Greek successors made any progress that is significant from a modern point of view, and neither people rose to the abstract conception of a theory of equations as a fruitful field of mathematical science. The Indians, with their peculiar addiction to arithmetic, achieved more.

The theory of equations is concerned chiefly with the properties of a single algebraic equation of the type

$$c_0x^n+c_1x^{n-1}+\cdots+c_n=0,$$

in which n is a positive whole number, the coefficients $c_0, c_1, \cdots, c_{n-1}$ are any given numbers, or numbers that are not specified but are assumed known, and $c_0\neq 0$. The nature of the coefficients will be made more precise later, as on them the whole theory depends. The degree of this equation is n. Roughly speaking, the theory of equations discusses this problem:—The coefficients being specified, find all values of x which make the equation true. This again will be amplified and made more definite as we proceed. The finding of x is called *solving the equation*.

The Greeks are sometimes credited with solving equations of the second degree. Thus Euclid's *Elements*, ii. 11, is equivalent to solving $x^2+ax=a^2$. There are two values of x; Euclid was content with one. In the 9th century A.D. the Arab, Mohammed ibn Mûsâ al-Khowârizmî (whose name is variously transliterated) gave both values 3, 7 of x in $x^2+21=10x$; he also discussed many more equations of the second degree. Like other Arabic writers, he used the equivalent of the term "root" for a value of the unknown. Great advances were made in the 15th and 16th centuries by the Italian mathematicians, who solved the general equations of the third and fourth degrees. These will be considered later. In spite of its brilliance, their work had but little direct influence on the evolution of a *theory* of algebraic equations. Curiosity as to the underlying reason for success or failure seems not to have perturbed the practical mind of the 16th-century algebraist. That rare type of speculation was reserved for the golden age of the late 18th and early 19th centuries; and although significant progress was made in the 18th century, notably by Joseph Louis Lagrange in a classic memoir of 1770–71, it was only with the researches of Évariste Galois (1811–1832) that the theory, at one stride, reached its maturity. Galois was killed in a duel at the age of 21.

Formerly the theory included much that is now relegated to other departments of algebra, *e.g.*, the solution of simultaneous equations of the first degree in several unknowns, which is now an application of determinants (*q.v.*) and matrices. As commonly understood to-day, the theory of algebraic equations is concerned chiefly with two problems and their numerous ramifications, all of which sprang directly from the necessity for solving the equations presented by problems in pure and applied science. To describe these, a few definitions must first be recalled. For an understanding of certain parts of the sequel an elementary acquaintance with the plotting of simple curves is presupposed; for others, a knowledge of derivatives, and Taylor's theorem (*q.v.*), and finally, for the modern theory, the reader is assumed to have read parts of the article GROUPS.

A number $a+bi$, in which a, b are real numbers and $i\equiv\sqrt{-1}$, is called complex (*see* COMPLEX NUMBER); if $b=0$, the number is real, otherwise it is imaginary. Let n be a positive integer other than zero, and let $c_0, c_1, \cdots, c_n$ be complex numbers not involving x. If c_0 is not zero, the polynomial

$$f(x)\equiv c_0x^n+c_1x^{n-1}+\cdots+c_n$$

is of degree n. A complex number k, which is such that $f(k)=0$, is called a root of the algebraic equation $f(x)=0$ of degree n, and the value k of n is said to satisfy the equation; $f(x)$ is also said to vanish when $x=k$. According as none, or some, of the coefficients $c_0, c_1, \cdots, c_n$ are imaginary, the equation $f(x)=0$ is called real or imaginary. It is necessary to consider both real and imaginary equations. If $f(x)=0$ is imaginary, its solution is reduced to that of real equations thus:—Write $f(x)$ in the form $g(x)+ih(x)$, where the coefficients of $g(x)$, $h(x)$ are all real. Then $g(x)+ih(x)=0$. Multiply the last throughout by the conjugate imaginary $g(x)-ih(x)$. The result is a real equation, among whose roots occur all those of $f(x)=0$. Real equations are thus the fundamental ones, but we shall not assume $f(x)=0$ to be real unless so stated.

The central problems of the theory are these: (a) To find a root of $f(x)=0$, *i.e.*, to solve the equation, when the degree n and the coefficients $c_0, c_1, \cdots, c_n$ are given. (b) To determine the precise conditions under which the roots of $f(x)=0$ can be expressed in terms of the coefficients by means of a finite number of algebraic operations (additions, multiplications, subtractions, divisions, extractions of roots). This is called the algebraic solution, or the solution by radicals, of $f(x)=0$. The exact sense in which the coefficients are "given" in this problem is the crux of the modern theory; for the present it suffices to state that they may be considered as independent variables. If in (a), when the coefficients have given numerical values, a root cannot be found exactly, a practicable process must be devised whereby a root may be exhibited to any prescribed degree of approximation. If in (b) the roots are not expressible in the form demanded, it is required to construct the simplest functions of the coefficients that do satisfy the equation. For example, it was almost proved in 1824 by Niels Heinrick Abel, then only 22 years of age, that the solution by radicals of the general equation of degree >4 is impossible. His attempt contains two oversights, now easily rectified by the Galois theory. The current assertion that Abel proved the general equation of degree >4 solvable by radicals

impossible, is definitely incorrect. The objections by William Rowan Hamilton in 1839 to Abel's alleged proof alone are valid.

In 1858 Charles Hermite first solved the general equation of degree 5 by means of elliptic functions (*q.v.*). Modern work in this direction, originating with Henri Poincaré about 1880, solves the general equation of degree n in terms of Fuchsian functions. Current developments of (b) are inextricably interwoven with the theories of substitution groups, algebraic numbers (modern higher arithmetic) and special functions of a complex variable; (a) is practically exhausted.

The Fundamental Theorem.—A basic result for both (a) and (b) is the so-called fundamental theorem of algebra, which states that every algebraic equation has a root. More fully, it is proved either from this, or almost in one step from an application of an integral formula of Augustin Louis Cauchy in the theory of functions of a complex variable, that an equation of degree n has precisely n roots. The remarkable feature of this theorem is that, in order to solve completely any algebraic equation, it is unnecessary to go beyond the domain of complex numbers. It is by no means obvious that this should be so. The novice in algebra regards the theorem as a truism; the seasoned mathematician sees in it a species of fortunate miracle, while the sophisticated critic views it with suspicion. The first alleged satisfactory proof was given in 1799 by Karl Friedrich Gauss, who subsequently added three more.

Actually the theorem is not in the purview of algebra, as all proofs, depending ultimately upon continuity, are analytic and belong to the calculus. A proof adequate to the demands of modern rigour would implicitly traverse the entire theory of the continuum. Certain ultra-rigorists of the school founded by Leopold Kronecker, and invigorated to-day by L. E. J. Brouwer and Hermann Weyl, might even assert that, not only has the fundamental theorem not yet been proved, but also that it is without meaning. From the standpoint of modern mathematical foundations a fatal epistemological imperfection of the classical proofs is their failure to exhibit a process for constructing, in a well-defined number of well-defined operations, the roots whose existence the purported proofs undertake to establish. The difficulty here, of course, is irrelevant for the pragmatic problem of solving a numerical equation to a prescribed degree of accuracy. However disturbing such scepticism may be to the 20th-century critical logician, it need not deter the engineer who is capable of plotting a graph sufficiently accurate for most practical purposes. It is interesting, however, on account of its indication that mathematical reasoning may be as fallible as any other; and it should not be forgotten by the professional mathematician that to-day's heterodoxy is to-morrow's rigorous orthodoxy.

Symmetric Functions.—Before developing the elementary consequences of the fundamental theorem (provided it be proved, or accepted as a hypothesis), it is necessary to define symmetric functions and to state a few of their properties. Let $x_1, x_2, \cdots, x_n$ be independent variables. A rational function of $x_1, x_2, \cdots, x_n$ (obtained from these by a finite number of additions, multiplications, subtractions, divisions, no divisor being zero), is said to be symmetric in $x_1, x_2, \cdots, x_n$ if it is unchanged when any two of $x_1, x_2, \cdots, x_n$ are interchanged. Thus $x_1x_2+x_2x_3+x_3x_1$ is symmetric in x_1, x_2, x_3, since it is unchanged when x_1 and x_2, or x_2 and x_3, or x_3 and x_1 are interchanged. Let $(x_a x_b x_c \cdots x_q x_p)$ denote a substitution which replaces x_a by x_b, x_b by $x_c, \cdots, x_q$ by x_p, x_p by x_a, and let 1 indicate the substitution ("the identity") which leaves every letter unchanged. The set of all substitutions on $x_1, x_2, \cdots, x_n$ is a group, called the symmetric group on these letters; any symmetric function of the n letters is said to belong to this group, since it is unchanged under all substitutions of the group. Thus $x_1x_2+x_2x_3+x_3x_1$ belongs to 1, (x_1x_2), (x_2x_3), (x_3x_1), $(x_1x_2x_3)$, $(x_1x_3x_2)$. These ideas and their generalization to groups other than the symmetric will be of use later.

The jth elementary symmetric function of $x_1, x_2, \cdots, x_n$, for $j=1, 2, \cdots, n$, is, by definition, the sum of all possible products of precisely j different variables chosen from the set $x_1, x_2, \cdots, x_n$. Thus, for $n=3$, the 1st, 2nd, 3rd elementary symmetric functions are $x_1+x_2+x_3$, $x_1x_2+x_2x_3+x_3x_1$, $x_1x_2x_3$, and these are all the elementary symmetric functions of x_1, x_2, x_3. There are obviously an unlimited number of symmetric functions other than the elementary; it suffices to apply to any rational function of $x_1, x_2, \cdots, x_n$ the $n!$ substitutions of the symmetric group on these letters and add the results; any numerical factor common to all the terms may be suppressed. For example, when $n=3$, $x_1^2+x_2^2+x_3^2$ is symmetric in x_1, x_2, x_3, and is equal to

$$(x_1+x_2+x_3)^2-2(x_1x_2+x_2x_3+x_3x_1).$$

The last illustrates the important theorem that any polynomial P which is symmetric in $x_1, x_2, \cdots, x_n$, is equal to a polynomial Q in the elementary symmetric functions and the coefficients of P; the coefficients of Q are whole numbers. If all the coefficients of P are also whole numbers, Q is a polynomial in the elementary symmetric functions alone with whole number coefficients. These properties constitute the fundamental theorem of symmetric functions. The reduction to elementary symmetric functions is unique.

Relations Between Roots and Coefficients.—The first useful consequence of the fundamental theorem of algebra is this:— If $x_1, x_2, \cdots, x_n$ are the n roots of $f(x)=0$, where

$$f(x)\equiv c_0x^n+c_1x^{n-1}+\cdots+c_n,$$

then

$$f(x)=c_0(x-x_1)(x-x_2)\cdots(x-x_n).$$

Conversely, if $f(k)=0$, then $x-k$ is a factor of $f(x)$. More generally, if t is any complex number, $f(t)$ is equal to the remainder obtained on dividing $f(x)$ by $x-t$, and hence $f(t)$ can be calculated by division, a result of importance in the numerical solution of equations. This is called the *remainder theorem*.

Since $c_0, c_1, \cdots, c_n$ are any complex numbers independent of x, and $c_0\neq 0$, the equation $f(x)=0$ may be divided throughout by c_0. It then becomes $x^n+a_1x^{n-1}+\cdots+a_n=0$, where $a_1, \cdots, a_n$ are complex numbers, and this form is precisely as general as the original. When convenient we shall use it. If the roots are $\alpha_1, \alpha_2, \cdots, \alpha_n$, the linear ($\equiv$first degree in x), factors of

$$x^n+a_1x^{n-1}+\cdots+a_n$$

are

$$(x-\alpha_1)\ (x-\alpha_2)\cdots(x-\alpha_n),$$

and hence, on comparing coefficients of like powers of x, we see that $a_j=(-1)^j$ times the jth elementary symmetric function of the roots, for $j=1, 2, \cdots, n$. In particular, $a_n=(-1)^n$ times the product of all the roots. This frequently is useful in testing for rational roots of an equation whose coefficients are rational numbers; by this means all the rational roots may be found. By the fundamental theorem on symmetric functions it follows that any symmetric polynomial P in the roots $\alpha_1, \alpha_2, \cdots, \alpha_n$ is equal to a polynomial Q in the coefficients $a_1, a_2, \cdots, a_n$ and the coefficients of P; the coefficients of Q are whole numbers. If both the coefficients of the equation and those of P are rational numbers, then Q is a rational number.

Simple Properties of Real Equations.—Among the more useful elementary properties of real equations are the following: Imaginary roots, if any, occur in conjugate pairs, $a+bi$, $a-bi$ (a, b are real numbers and $i\equiv\sqrt{-1}$). Hence, if the degree n is odd, the equation has at least one real root. Again, $f(x)$ being a real, continuous function of x (*see* FUNCTION), it follows that if $f(r)$, $f(s)$ have opposite signs, where r, s are real numbers, the curve whose equation is $y=f(x)$ cuts the axis of x an odd number of times between r and s. If among the n roots of $f(x)=0$ there are precisely h each equal to α, and $h>1$, the root α is said to be of multiplicity h. Let $f'(x)$ be the first derivative of $f(x)$. Then the *theorem of Michel Rolle* states that between two consecutive real roots of $f(x)=0$ there is an odd number of real roots of $f'(x)=0$, provided a root of multiplicity h be counted as h roots.

As several subsequent theorems are considerably simpler for equations having no multiple roots, it is important to refer all cases back to this, as follows: If the highest common factor of $f(x)$ and $f'(x)$ involves x, let it be $g(x)$. Then a root of $g(x)=0$, of multiplicity m, is a root of $f(x)=0$, of multiplicity $m+1$; conversely, any root of $f(x)=0$, of multiplicity $m+1$, is a root

of $g(x)=0$, of multiplicity m. By successive applications of the process for finding the highest common factor, any multiple roots that may be present can be found. If the root α is of multiplicity h, $(x-\alpha)^h$ is a factor of $f(x)$, and similarly for all multiple roots. Dividing $f(x)$ by the product of all such $(x-\alpha)^h, \cdots$, we obtain a polynomial which vanishes only for the simple roots of $f(x)=0$. This argument for multiple roots is perfectly general and is not restricted to real equations.

When $f(x)=0$ is *real*, it is possible, by measuring where the graph of $y=f(x)$ crosses the x-axis, to ascertain how many real roots lie within given limits; by sufficiently enlarging the scale a particular real root may be located with any desired degree of accuracy. The graphical method is a valuable adjunct to the arithmetical processes, as in all numerical solutions the initial difficulty is in approximately locating the root to be calculated. If the real equation $f(x)=0$ has *imaginary roots* $u+iv$, $v\neq 0$, the values of u, v are found by solving the simultaneous equations

$$f(u)-f^{(2)}(u)v^2/2!+f^{(4)}(u)v^4/4!-\cdots=0,$$
$$f^{(1)}(u)-f^{(3)}(u)v^3/3!+f^{(5)}(u)v^5/5!-\cdots=0,$$

where $f^{(j)}(u)$ denotes the jth derivative of $f(u)$. These are obtained by equating to zero the real and imaginary parts of the Taylor expansion (*see* TAYLOR'S THEOREM) of $f(u+iv)$. Their solution is reduced to that of an equation in u or v alone by elimination. The determination of the roots, real and imaginary, of real equations is thus thrown back to the problem of finding the real roots of real equations and, as we have seen, the solution of an imaginary equation is reducible to the same. A further reduction, which in the case of equations with numerical coefficients is of great utility, is possible. The negative real roots of the real equation $f(x)=0$ are evidently the positive real roots of $f(-x)=0$. To find the negative real roots of $f(x)=0$, it suffices therefore to find the positive real roots of the equation obtained from $f(x)=0$ by changing the signs of all the terms of odd degree in $f(x)=0$. Thus problem (a) may be limited to the discovery of the positive real roots of real equations.

Elimination.—This process being of frequent occurrence in the theory and its applications, we shall describe the so-called dialytic method, invented by James Joseph Sylvester, for performing it. Usually this is as simple as any other, and often is simpler. Let $f(x)$, $g(x)$ be polynomials in x of degrees m, n respectively. We seek first a necessary and sufficient condition that $f(x)=0$ and $g(x)=0$ shall have a root in common. Let $x_1, x_2, \cdots, x_n$ be the roots of $f(x)=0$. Then $f(x)=0$ and $g(x)=0$ will have a common root when and only when $g(x_1)\,g(x_2)\cdots g(x_n)=0$, since $g(x)$ vanishes only when x is a root of $g(x)=0$. To avoid fractions in the final expression, multiply by c_0^n ($c_0\equiv$ the coefficient of x^n in $f(x)=0$), and obtain $c_0^n g(x_1)g(x_2)\cdots g(x_n)$, whose vanishing expresses the required condition. This function of $x_1, x_2, \cdots, x_n$ is called the resultant of the two equations. The vanishing of their resultant is therefore a necessary and sufficient condition that two equations shall have at least one root in common. Since the resultant as written is a symmetric function of the roots $x_1, \cdots, x_n$, it is a rational (also integral, by the factor c_0^n) function of the coefficients of both equations. Denote this function by $[f, g]$. Then $[f, g]=0$ is called the result of eliminating x from the two equations.

The actual elimination is easily performed by Sylvester's method. First, it is shown in the theory of determinants, that a necessary and sufficient condition that n linear and homogeneous equations in n unknown shall have a common set of solutions, other than the trivial one in which each unknown is zero, is that the determinant of the coefficients vanish. Apply this to $f(x)=0$, of degree m, and $g(x)=0$, of degree n, as follows:— Multiply the first equation throughout by $1, x, x^2, \cdots, x^{m-1}$ in turn, and the second by $1, x, x^2, \cdots, x^{n-1}$. This gives $n+m$ equations linear and homogeneous in $1, x, x^2, \cdots, x^{m+n-1}$. The determinant of this set equated to zero is the required elimination.

Discriminants.—Occasionally in physical problems it is sufficient to know whether a given equation has real roots, and, if so, how many. A graph will usually give the desired information most readily. Algebraically, the question is answered for degrees 2, 3, 4 by examining the simplest rational integral function of the coefficients whose vanishing is the condition that the given equation shall have a pair of equal roots. This function is called the discriminant of the given equation. From the foregoing statements concerning multiple roots and resultants, a sufficient condition that $f(x)=0$ shall have a pair of equal roots is that the resultant of $f(x)=0$ and $f'(x)=0$ vanish. Thus, for

$$ax^3+bx^2+cx+d=0,$$

the general equation of the third degree,

$$f'(x)=3ax^2+2bx+c,$$

and elimination gives

$$18abcd-4b^3d-4c^3a+b^2c^2-27a^2d^2=0,$$

the left of which is the discriminant of the given equation.

An alternative definition is the following. Let $x_1, x_2, \cdots, x_n$ be the n roots of $f(x)=0$, and write $\delta_{ab}\equiv x_a-x_b$ for $b>a$. There are thus precisely $(n-1)+(n-2)+\cdots+1$ differences δ_{ab}, as a runs through $1, 2, \cdots, n-1$. The product of the squares of these $n(n-1)/2$ differences, multiplied by c_0^{2n-2} (where c_0 is the coefficient of x^n in the stated equation), is a rational integral function of the coefficients of $f(x)=0$, since it is symmetric in the roots and the factor c_0^{2n-2} cancels all denominators. This function is taken as the discriminant of $f(x)=0$, as it obviously satisfies all the requirements of the definition. It is easily proved that the two methods of finding the discriminant lead to the same result.

As specimens of the information furnished by discriminants, examples for real equations of the second and third degrees will suffice. The discriminant of $ax^2+bx+c=0$ is b^2-4ac. If this equation is real, its roots are real and distinct, real and equal, imaginary and distinct, according as the discriminant is greater than, equal to, or less than zero. Likewise, a real equation of the third degree has three distinct real roots, or one real root and two conjugate imaginary roots, or at least two equal roots, according as the discriminant of the equation is greater than, less than, or equal to zero. Discriminants are of capital importance in solutions by radicals.

Location of Roots.—We have seen that the problem of solving an equation with given numerical coefficients is reducible to that of finding the positive real roots of real equations. Accordingly, it is assumed in the following discussion that $f(x)=0$ is a real equation. The first step in finding the real roots, positive, zero, or negative, is to isolate them. A real root r of $f(x)=0$ is said to be isolated when two real numbers, a, b, between which r lies, and between which lies no other root of $f(x)=0$, are known. The graphical method, as already indicated, is useful here as a reconnaissance, but usually more powerful weapons must be applied. One is René Descartes' *rule of signs* which gives, in most cases, some information regarding the total number of real roots. Let $f(x)$ be $c_0x^n+c_1x^{n-1}+\cdots+c_n$, the coefficients being real numbers, positive, zero or negative, $c_0\neq 0$. If $c_0<0$, change the signs throughout $f(x)=0$. Thus, without loss of generality, we assume $c_0>0$. Write down now all the signs of the non-zero coefficients in the order in which they occur in $f(x)$. A change from $+$ to $-$, or from $-$ to $+$, is called a variation. Count the variations. Thus, in $++---+-$ there are three. Descartes' rule states that $f(x)=0$ has as many positive real roots, or fewer by an even number, as there are variations. The roots of $f(-x)=0$ being the negatives of those of $f(x)=0$, the rule, applied to $f(-x)=0$, gives similar information regarding the number of negative real roots. This rule, however, may fail to tell us anything of value. Its proof is quite simple.

A conclusive method for isolating the roots was discovered in 1829 by J. C. F. Sturm. Let $f'(x)$ be the first derivative of $f(x)$. Write $f(x)\equiv f$, $f'(x)\equiv f'$, and similarly, in what follows, for all polynomials in x. Proceed as in finding the highest common factor of f, f'. Let q_1 be the quotient and r_1 the remainder at the first step. Then $f=q_1f'+r_1$. Before using r_1 as the next divisor, change its sign, and write $-r_1\equiv f_2$, so that $f=q_1f'-f_2$. Divide f' by f_2; denote the remainder, with its sign changed, by f_3. Continue thus with all remainders. For simplicity suppose first that

$f(x)=0$ has no pair of equal roots. The last changed remainder, f_n, will then be a constant $\neq 0$. The sequence of changed remainders, with f, f' prefixed, viz.,

$$f(x),\ f'(x),\ f_2(x),\ \cdots,\ f_{n-1}(x),\ f_n,$$

is called the set of *Sturm functions* for $f(x)$.

Now let a, b be real numbers, neither a root of $f(x)=0$, and let $a<b$. To find the number of real roots of $f(x)=0$ lying between a and b, put $x=a$ in the Sturm functions, and delete any terms that then vanish. Count the variations of sign (as in Descartes' rule) in the resulting sequence of real numbers. Let there be V_a variations. Proceed similarly with b, and obtain V_b. Then the number of real roots between a and b is V_a-V_b. In particular, if $a=-\infty$, $b=+\infty$. Sturm's theorem thus gives the total number of real roots when we attend only to the signs attached to the highest powers of x in his functions. (The computations are usually laborious, but awkward fractions can be avoided by multiplying each dividend by a properly chosen positive constant before dividing). Next, if $f(x)=0$ has multiple roots, V_a-V_b is still the number of real roots between a and b, provided each multiple root be counted once only. In practice, however, it is simplest to get rid of the multiple roots first, by the method already indicated.

A less powerful theorem by the French physician F. D. Budan (1807), proved by J. B. J. Fourier about 1829, involves less computation than Sturm's, and is often usable. Let $f^{(j)}(x)$be the jth derivative of $f(x)$; replace Sturm's sequence by

$$f(x),\ f^{(1)}(x),\ f^{(2)}(x),\ \cdots,\ f^{(n)}(x),$$

and proceed in this sequence with the same a, b as before, precisely as in calculating V_a, V_b for Sturm's. Then, if a root of multiplicity m be now counted as m roots, V_a-V_b for this sequence is either the number of real roots of $f(x)=0$ between a and b, or exceeds it by a positive whole number.

It is sometimes convenient to know an upper limit L to the value of the real roots of $f(x)=0$. Let G be the greatest of the numerical values of the coefficients $c_0, c_1, \cdots, c_n$. If the first negative coefficient is preceded by precisely s coefficients that are greater than, or equal to, zero, then $L=1+\sqrt[s]{(G/c_0)}$. Another upper limit is as follows: If c_0 is negative, change all signs in $f(x)=0$. Divide then the numerical value of each negative coefficient by the sum of all those positive coefficients that precede it. Let Q be the greatest of these quotients. Then $1+Q$ is the upper limit in question.

Computation of Roots.—When a real root of a real equation $f(x)=0$ has been isolated by any of the methods suggested, it may be calculated, digit by digit, by any one of several arithmetical processes, the commonest of which is that, named after W. G. Horner (1819), which was known to the Chinese mathematicians of the 13th century, and Isaac Newton's of about 1675. Newton's method has the great advantage of being applicable to equations other than algebraic. It can be explained by his own example, $x^3-2x-5=0$. This has only one root between 2 and 3. To find this root, replace x by $2+h$, where h is necessarily between 0 and 1. The terms in h^2 and h^3 being neglected, in comparison with h, in the new equation

$$h^3+6h^2+10h-1=0$$

we get $h=0{\cdot}1$ as a first approximation to h, and hence the root is roughly $2{\cdot}1$. For the next approximation, replace h by $0{\cdot}1+k$ in the h-equation, and obtain

$$k^3+6{\cdot}3k^2+11{\cdot}23k+0{\cdot}061=0.$$

Omit the k^3, k^2 terms, which will be small in comparison with k; then k is approximately $-0{\cdot}0054$. From $h=0{\cdot}1+k$ we get $h=0{\cdot}0946$, giving $2{\cdot}0946$ as an approximate value of the required root. By repeating the process a sufficient number of times any desired degree of accuracy is attainable. The method amounts to retaining only the first two terms in the Taylor series (*see* TAYLOR'S THEOREM) for $f(r+h)$, on the supposition that h is small in comparison with the approximate value r of a real root of $f(x)=0$; so that $0=f(r+h)=f(r)+hf'(r)$ approximately, and $h=-f(r)/f'(r)$; whence $r_1=r+h$ is the first approximation. The process is repeated with $h_1=-f(r_1)/f'(r_1)$; and $r_2=r+h+h_1$ is the second approximation. In Newton's example,

$$f(x)=x^3-2x-5,\ f'(x)=3x^2-2,\ r=2,\ h=0{\cdot}1,\ h_1=-0{\cdot}0054.$$

In Horner's method (the one usually given in elementary texts on algebra, except those most popular on the continent of Europe) a set of equations, one for each digit of the required root, is obtained successively from the given equation. The process is an arithmetical restatement and refinement of the crude graphical method, and amounts to successive shifts of the origin and magnifications of the scale. As already pointed out, it is sufficient to discuss the method for positive real roots only. The essence of the method is the successive diminution of the roots of the given equation by the smaller member in successive pairs of positive real numbers; *i.e.*, we gradually creep up on the root from behind. Suppose, for example, that a real root of $f(x)=0$ has been isolated between 200 and 300. If we can construct an equation $f_1(x)=0$, whose roots are those of $f(x)=0$ each diminished by 200, then $f_1(x)=0$ will have one and only one root between 0 and 100. By any of the proposed methods locate this root; say it is between 60 and 70. Then $f(x)=0$ has a root between 260 and 270. Construct $f_2(x)=0$, whose roots are those of $f_1(x)=0$ diminished by 60, and repeat the argument. Then $f_2(x)=0$ has a root between 0 and 10, which may be located as before; *e.g.*, between 5 and 6. Then 5 is the third digit of the required root of $f(x)=0$, and we next form $f_3(x)=0$, whose roots are those of $f_2(x)=0$ diminished by 5, and $f_3(x)=0$ has a root between 0 and 1, say $0{\cdot}2$. The required root so far is $265{\cdot}2$, and the process can be continued to any prescribed number of digits. It will automatically terminate, or yield a repeating decimal, if the root is a rational number. The rational roots, if any, are however best obtained first by trial by examining the constant term of $f(x)$ as already indicated.

The essential detail of constructing the equation $f_1(x)=0$ whose roots are those of $f(x)=0$ each diminished by the positive number h, is performed by synthetic division according to the following theorem, which is an immediate consequence of the expansion of $f(x+h)$ by Taylor's theorem. If

$$f(x)\equiv c_0x^n+c_1x^{n-1}+\cdots+c_n$$

be divided by $x-h$, let the quotient be q_n and the remainder r_n. Divide q_n by $x-h$; let the quotient be q_{n-1} and the remainder r_{n-1}. Continue thus to n divisions. The last quotient is c_0; say the last remainder is r_1. Then

$$f_1(x)\equiv c_0x^n+r_1x^{n-1}+r_2x^{n-2}+\cdots+r_{n-1}x+r_n.$$

Many devices for shortening the labour of Horner's method are explained in treatises on equations; in particular the last digit (at least) that is required can, in general, be obtained by simple division. Horner's method is, beyond any question, the most practical yet devised for the numerical solution of equations with numerical coefficients. Other methods of solving numerical equations are an impracticable one by continued fractions, due to Lagrange, and others by expansions in infinite series. The latter has recently been reconsidered by E. T. Whittaker, who expresses the coefficients in the series for a root in terms of determinants that can be easily computed.

Algebraic Solutions of Equations of the Second, Third and Fourth Degrees.—These equations are called respectively the *quadratic*, the *cubic*, and the *biquadratic*. The initial step in seeking a solution by radicals is usually the reduction of the given equation to another containing fewer powers of the unknown. In particular, the second highest power of the unknown, if present, may be removed as follows: In $c_0x^n+c_1x^{n-1}+\cdots+c_n=0$ put $x=y+k$. The coefficient of y^{n-1} is then nkc_0+c_1. Hence by choosing $k=-c_1/nc_0$, we obtain an equation in y lacking the second term. If the y-equation can be solved, the roots of the x-equation are obtained from $x=y-c_1/nc_0$.

Thus, for the general quadratic, $c_0x^2+c_1x+c_2=0$, we have

$$k=-c_1/2c_0;$$

the y-equation is $y^2=K$, where

$$K=(c_0k^2+c_1k+c_2)/c_0, \ =(c_1^2-4c_0c_2)/4c_0^2,$$

and hence, from $y=\pm\sqrt{K}$, $x=y+k$, we have the roots

$$[-c_1\pm\sqrt{(c_1^2-4c_0c_2)}]/2c_0$$

of the x-equation in the usual form. For the general cubic

$$c_0x^3+c_1x^2+c_2x+c_3=0,$$

the value of k is $-a_1/3a_0$; the substitution $x=y-a_1/3a_0$ gives $y^3+py+q=0$, where

$$p\equiv(3a_0a_2-a_1^2)/3a_0^2, \quad q\equiv(2a_1^3-9a_0a_1a_2+27a_0^2a_3)/27a_0^3.$$

If y_1, y_2, y_3 are the roots of the y-equation, and x_1, x_2, x_3 those of the x-equation,

$$x_j=y_j-a_1/3a_0, \quad (j=1, 2, 3).$$

Before Lagrange the solution of $y^3+py+q=0$ was achieved by ingenious substitutions based on nothing, apparently, but skill in guessing. Thus, by choosing $y\equiv z-p/3z$, François Viète (Vieta) in 1591 obtained $z^6+qz^3-p^3/27=0$, a quadratic in z^3 whence he obtained three permissible values of y, and thence x_1, x_2, x_3. The final formulae, reproduced in texts on algebra, were first published in the *Ars Magna* (1545) by Hieronimo Cardano, who had obtained them from Tartaglia ("the stutterer," true name Nicolo Fontana) by questionable means. In numerical work, Horner's method is greatly preferable to direct substitution into Tartaglia's formulae. When all three roots are real, the so-called irreducible case, the formulae involve cube roots of imaginaries and are then necessarily worthless. In this case a usable trigonometric solution is found by putting $y=tz$ in $y^3+py+q=0$, and identifying the resulting equation with

$$\cos 3\theta\equiv 4\cos^3\theta-3\cos\theta,$$

by means of

$$z\equiv\cos\theta, \quad t\equiv\sqrt{(-4p/3)}, \quad \cos 3\theta\equiv -q/2\sqrt{(-p^3/27)}.$$

The last gives the 3 values of z, namely $\cos\theta$, $\cos(\theta+120^0)$, $\cos(\theta+240^0)$, whose numerical values can be obtained from trigonometric tables. Finally the values of y are found by multiplying those of z by t. The irreducible case has a plethoric literature of its own.

The general biquadratic may be taken in the form

$$x^4+a_1x^3+a_2x^2+a_3x+a_4=0.$$

Its solution, due to Ludovici Ferrari, but first published in the *Ars Magna*, was found by adding $(mx+b)^2$ to both sides and imposing the condition that the new left-hand member be identically the square of $x^2+a_1x/2+k$, where h is to be found. By comparison of coefficients in the assumed identity, and subsequent elimination of m, a cubic for h is obtained. This cubic is called the resolvent, or reducing, cubic; its 3 roots enable us to find m and b. The solution of the biquadratic is thus finally reduced to that of two quadratics,

$$x^2+a_1/2+k\pm(mx+b)=0,$$

whose 4 roots are those required. The ultimate formulae, with the value of h inserted, are too complicated to be usable. Solutions by means of elliptic functions are known, but they also are mere algebraic curiosities.

There is a vast literature on cubic and biquadratic equations. Little of it is to-day of any vital mathematical consequence, and the most of it is of no practical value. Nevertheless, the incessant activity of nearly three centuries reflected in this accumulation of algebraic lore was not wholly futile, for without at least some of it, the sure clue to the maze could probably not have been discovered. To appreciate the true magnitude of this early work, the modern algebraist should attempt to restore it for himself, with but such tools and notations as its creators had. He will rise from his efforts with a new respect for his forbears.

A new era began with Lagrange in 1770. In an illuminating critique of his predecessors' solutions of the general cubic and biquadratic, he observed that the solution by radicals of any algebraic equation can be made to depend upon that of another, now called the resolvent, which may or may not be easier to solve. Thus, for equations of degree 5, the resolvent is of degree 6. The roots of a resolvent equation are rational functions of those of the original. By such considerations, and others arising naturally from them, Lagrange transposed the problem of solution by radicals to a profound study of rational functions of the roots of equations, and in particular to an investigation of the number of distinct values, which such functions of the roots, considered as independent variables, assume under permutations of the roots. This work contains a germ of the modern theory founded by Galois, in which the theory of substitution groups plays a central part.

An idea of Lagrange's attack can be gained from a brief reconsideration of $x^3+px+q=0$, which will also prepare the way for the Galois theory. Let the roots be x_1, x_2, x_3. The discriminant of this equation is the square of

$$D\equiv(x_1-x_2)\ (x_1-x_3)\ (x_2-x_3).$$

Let ω be an imaginary root of $x^3-1=0$, and write

$$F\equiv(x_1+\omega x_2+\omega^2x_3), \quad G\equiv(x_1+\omega^2x_2+\omega x_3).$$

The three functions F^3, G^3, D have the significant property that any substitution on x_1, x_2, x_3 which leaves one of these functions unchanged, leaves also the other two unchanged; for example, $(x_1x_2x_3)$. The totality of substitutions on n independent variables which leave a given function of those variables unchanged, form a group; the function is said to belong to the group. Lagrange proved that, if several functions belong to the same group, any one of them is a rational function of each of the others. Hence each of F^3, G^3 is a rational function of D, and therefore each is rational in the square root of a polynomial in p, q, since D^2, being the discriminant, is rational and integral in the coefficients of the equation. The coefficient of x^2 being zero in $x^3+px+q=0$, we have $x_1+x_2+x_3=0$, which, with the values of F, G just indicated, gives three equations of degree 1 to solve for x_1, x_2, x_3 in terms of algebraic functions of p, q. Since the determinant of the set does not vanish, a solution exists, and it is thus known *à priori* that the general cubic is solvable by radicals. When elaborated, this method yields the roots explicitly. The biquadratic is treated in a similar manner; the general equation of degree 5 cannot be so solved, for a reason that will appear in the concluding sections.

As Lagrange's great work was but a preliminary to that of the modern school, further discussion of it may be omitted. Contemporaneously with Lagrange, an Italian physician, Paolo Ruffini, began issuing in 1799 a series of memoirs containing incidentally theorems which would now be restated in terms of substitution groups on five letters, in an attempt to prove the general equation of the fourth degree algebraically unsolvable. He almost succeeded, but his projected proof, like Abel's, is incomplete, and the whole matter is to-day surveyed from the higher point of view of Galois. Before passing to this we examine a general process of which several applications have occurred in what preceded.

Transformations.—The importance of transforming a given equation into another, whose roots are particular functions of those of the original, was seen in the preceding sketches of the solutions, numerical or algebraic, of equations. Thus, an important detail of Horner's method was equivalent to the linear transformation $x=y+k$; the roots of the y-equation were those of the x-equation each diminished by k. This is one of the simplest examples of a more general transformation introduced in 1683 by Ehrenfried Walther Tschirnhausen (or Tschirnhaus), who attempted to solve all equations by reducing them to the form $y^n=A$ — an impossible project. Let $x_1, x_2, \cdots, x_n$ be the roots of $f(x)=0$. On dividing any polynomial P in a given root, say x_1, by $f(x_1)$, the polynomial is reduced to another of degree $n-1$, at most, in x_1. Tschirnhaus transformations are of the type $y=P(x)/Q(x)$, where P, Q are polynomials of degree $<n$, and $Q(x)$ vanishes for no root of $f(x)=0$; $Q(x)$ may reduce to a numerical constant, in particular to 1. This transforms $f(x)=0$ into an equation in y whose roots are $P(x_j)/Q(x_j)$, $(j=1, 2, \cdots, n)$. The y-equation can be obtained by elimination; the details usually

are tedious.

The use of such transformations is evident from the following specimens. By a transformation $y=p+qx+x^2$, where p, q do not involve x, the general cubic is reducible to $y^3=A$, where A depends only on p, q and the coefficients of the cubic. More generally, by a linear transformation, or by a Tschirnhaus transformation $y=a+bx+cx^2$, whose coefficients involve only 1 square root, the general equation of degree n can be reduced to an equation of degree n in y lacking the terms in y^{n-1}, y^{n-2}. Or again, by a Tschirnhaus transformation whose coefficients involve only 1 cube root and 3 square roots, the general equation of degree n is reducible to an equation in y of degree n lacking the terms in y^{n-1}, y^{n-2}, y^{n-3}. The last is of capital importance, for the general equation of degree 5, which is thus reducible to $y^5+ry+s=0$, a result obtained by E. S. Bring about 1786, and independently by G. B. Jerrard in 1827. This is one point of departure for the solution in terms of elliptic functions, as a similar equation appears naturally in the construction of elliptic functions whose periods are fifths of those of given functions.

Fields and Reducibility.—These concepts are fundamental in the modern theory. A field is a set of elements closed under addition, subtraction, multiplication, division, no divisor being the zero of the set. The elements may be numerical, or mere marks, or they may be partly one and partly the other. Marks can be considered as independent complex variables. Elements of a given field are said to be "rationally known." In the general equation $x^n+c_1x^{n-1}+\cdots+c_n=0$ of degree n, the coefficients are independent complex variables. Rational functions of the roots $x_1, x_2, \cdots, x_n$ are equal only when they are equal for all sets of values of the roots; *i.e.*, the roots are considered as indeterminates. If, however, the coefficients of an equation are given numerical constants, equality of rational functions of the roots means equality of numerical values of the functions. It must be noticed that, although a substitution on the roots may change the form of a rational function, the numerical value of the function may remain unchanged. The substitutions leaving unchanged a rational function of the roots, considered as marks, form a group; in general the like is false for roots of numerical equations. If the coefficients of a rational function are rationally known, it is called rational, and similarly for rational relations between the roots. Functions not equal as just defined are called distinct; two functions are said to be unchanged by a substitution on the roots if the new function is equal, as defined, to the original. If all the coefficients of a polynomial P are in a given field F, P is said to be in F. If P is neither the product of two polynomials in F, nor a constant, P is called irreducible (in F).

Group of an Equation.—Let the roots $x_1, \cdots, x_n$ of $f(x)=0$ be distinct. For a proper choice of $m_1, \cdots, m_n$, the function $V_1\equiv m_1x_1+\cdots+m_nx_n$ takes $n!$ distinct values under the symmetric group on the roots. It can be shown that any rational function $r(x_1, \cdots, x_n)$ of the roots is a rational function of V_1, say $R(V_1)$; and, with a certain restriction which we may ignore here, if $S_1\equiv 1, S_2, \cdots, S_h$ is any substitution group on the roots, and if $r_j(x_1, \cdots, x_n)$ is the result of applying S_j to $r(x_1, \cdots, x_n)$, then $r_j(x_1, \cdots, x_n)=R(V_j)$, where V_j comes from applying S_j to V_1. In particular then, each of $x_1, \cdots, x_n$ is a rational function of V_1. Write

$$F(V)\equiv(V-V_1)\ (V-V_2)\cdots(V-V_{n!}),$$

and, whether $F(V)$ is or is not reducible, let $F_1(V)=0$ be the irreducible factor of $F(V)$ such that $F_1(V)=0$ has V_1 as a root; $F_1(V)=0$ is called a Galois resolvent of $f(x)=0$. Each of its roots is a rational function of one of them. To solve $f(x)=0$ is equivalent then to finding one root, say V_1, of its Galois resolvent.

The degree g of $F_1(V)=0$ does not exceed $n!$; its g roots can be derived from V_1 by the substitutions of a group G, the so-called group of $f(x)=0$ for the field of its coefficients. Every rational function of the roots which is unchanged by all the substitutions of G is rationally known; every rationally known rational function of the roots of $f(x)=0$ is unchanged by all the substitutions of G; moreover, G is the smallest group having the first property, and the largest having the second. The group of the general equation of degree n is the symmetric group on the roots. If to the field of the coefficients of $f(x)=0$ there be adjoined a rational function of the roots, giving an enlarged field which contains the original, and if this function belongs to a subgroup of G, the group of the equation is reduced to the subgroup.

Solvability by Radicals.—A group is simple only if its invariant subgroups are itself and the identity; non-simple groups are called composite. A subgroup of G other than G is called proper; an invariant proper subgroup not a subgroup of a larger invariant proper subgroup is called maximal. Let H be a maximal invariant proper subgroup of any group G; let K be a maximal invariant proper subgroup of H, and so on, till the identity group 1. Then $G, H, K, \cdots, L$, 1 is called a series of composition of G. Let the respective orders of these groups be $g, h, k, \cdots, l$, 1. Then g/h, $h/k, \cdots, l$ are integers. They are the same, except for order, for all series of composition for G, and are called the factors of composition of G, which is called solvable if and only if its factors of composition are all primes.

The crown of Galois's theory is the beautiful theorem that an algebraic equation is solvable by radicals if and only if its group for the field of its coefficients is solvable. By the known properties of the symmetric groups on n letters, it follows at once that when $n>4$, the general equation of degree n is not solvable by radicals.

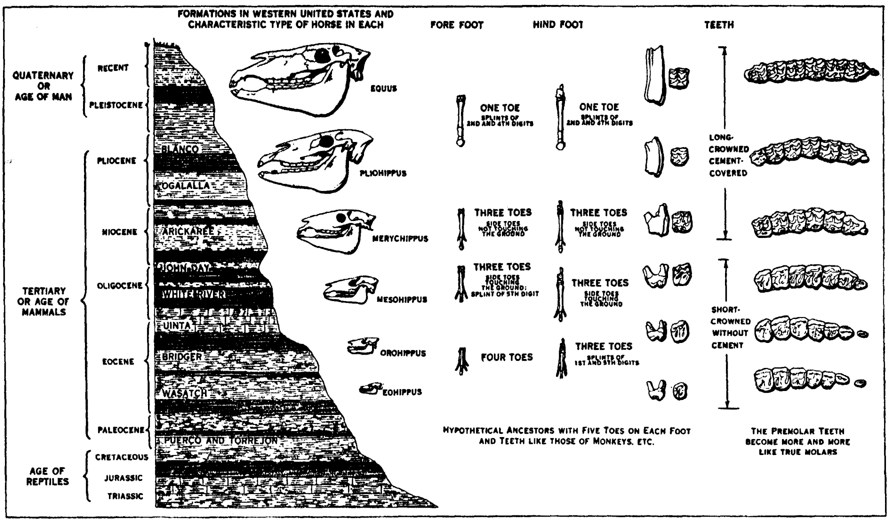
EQUATOR, in geography, that great circle of the earth, equidistant from the two poles, which divides the northern from the southern hemisphere and lies in a plane perpendicular to the axis of the earth; this is termed the "geographical" or "terrestrial equator." In astronomy, the "celestial equator" is the name given to the great circle in which the plane of the terrestrial equator intersects the celestial sphere; it is consequently equidistant from the celestial poles. The "magnetic equator" is an imaginary line encircling the earth, along which the vertical component of the earth's magnetic force is zero; it nearly coincides with the terrestrial equator.

EQUERRY, a contracted form of "gentleman of the equerry," an officer in charge of the stables of a royal household. At the British court, equerries are officers attached to the department of the master of the horse, the first of whom is called chief equerry (*see* Household, Royal).

EQUIDAE, the horse family, a family of hoofed mammals, of the order Perissodactyla, of which the modern genus *Equus* is the type. It is customary to include in this family the entire series of Tertiary ancestors of the horse, the three principal progressive stages being distinguished as sub-families—Hyracotheriinae, Anchitheriinae and Equinae. The Equidae, with the nearly related family of Palaeotheriidae, are included in the Hippoidea, one of the four primary groups into which the Perissodactyla subdivided early in the Eocene, the others being the Tapiroidea, Rhinocerotoidea and Chalicotheroidea. The fundamental distinction lies in the composition of the molars. The primitive pattern of the upper molars in the Perissodactyla consists of six rounded cusps partially united into an outer and two obliquely transverse crests. In the Hippoidea this pattern is converted into two outer crescents and two incomplete oblique transverse crests. This primitive pattern is perfected in the Anchitheriinae and is further modified in the Equinae in connection with the progressive conversion of the transverse crests into a pair of inner crescents and one or two more or less isolated inner pillars. The molars are thus finally converted into tall square prisms with a surface pattern of four crescents and an inner pillar, which grow up from the jaw as they are worn off at the top. They do not, however, attain the final stage of hypsodonty and become rootless ever-growing teeth



BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

EVOLUTION OF THE HORSE FROM THE AGE OF REPTILES TO THE PRESENT

as do the molars of edentates, some rodents, etc., but close up the roots at about the sixth year (in the modern horse). As in all Perissodactyls the premolars except $p\frac{1}{1}$ become progressively molariform. The front teeth in primitive Perissodactyla consist of a convex row of small spatulate incisors flanked by larger and more pointed canines, and separated by a considerable gap or diastema from the cheek teeth (premolars and molars). In the Hippoidea the incisors are progressively developed as a row of cropping teeth, the canines tend to be reduced or incisoform, the lower cheek teeth conform to the changes in the upper series, developing in the anchitheriine stage two obliquely set unsymmetric crescents, the posterior wing strong and subtransverse, the anterior wing weak, while in the Equinae the pattern is changed into a pair of symmetrical inward-facing outer crescents flanked by four supporting pillars on the inner side.

The feet in the Hippoidea undergo a marked reduction and specialization of the digits, commencing with the primitive hyracotheriines with four well-developed toes in the fore and three in the hind foot, followed by the anchitheriines with three toes on each foot but the lateral digits much reduced, then by the Equinae with the lateral digits further reduced, and finally becoming vestigial splints, the phalanges wholly lost, and the foot monodactyl. As the lateral digits are reduced the central (third) digit is enlarged, the metapodials elongated into cylindrical tubular cannon-bones, the central wrist and ankle bones enlarged and the lateral bones tend to acquire a footing on the median digit, or else disappear. The ulna and fibula are reduced and consolidated with the radius and tibia, these bones are elongated, while the humerus and femur tend to assume a more horizontal position and to be caught up into the shoulder and flank of the body. The neck vertebrae and the facial part of the skull are very considerably increased in length, the orbits become enclosed by a bridge of bone separating them from the temporal fossa, the angular region of the lower jaw and the ridge above the cheek teeth are much developed, in order to provide adequate attachments for powerful masseter muscles used in grinding the food; but the coronoid process and the median sagittal crest over the brain-case are relatively reduced, as the temporal jaw muscles are less used. The brain likewise increases in size and number of convolutions.

All these changes are features of adaptation of the equine phylum to swift-running for long distances in open and more or less level country, and to feeding chiefly upon the dry, hard grasses of the plains. They are paralleled in the evolution of various other races of similar habits and environment. In one family of the extinct Litopterna (*q.v.*) of South America a completely monodactyl running foot was developed, from the third digit as in the horses, but in the teeth these animals were less progressive than the horses, reaching only to a stage comparable with *Mesohippus*. In the ruminants a similar running foot is developed by consolidation of third and fourth digits; and in many of them, especially the cattle, there is also a close parallelism in teeth to the modern horse, the upper molar having two outer and two inner crescents and a separate inner pillar; but this is evolved out of different primary cusp elements than in the horses, and the premolars do not become molariform in any ruminant. The kangaroo has likewise developed a nearly monodactyl foot, but for leaping instead of running.

The evolution of the Equidae has been traced through a closely connected series of intermediate stages back to *Hyracotherium* or *Eohippus* of the Lower Eocene, about the size of a fox, with four complete toes on the fore foot and three on the hind foot and with short-crowned semi-bunodont molars, premolars smaller and of simple pattern. In the Middle and Upper Eocene stages (*Orohippus, Epihippus*) the premolars except $p\frac{1}{1}$ become progressively molariform and the molar crowns somewhat higher with more clearly defined crescents and cross-crests; the lateral digits are slightly reduced but the outer fifth digit of the fore foot is still functional. In the Oligocene *Mesohippus* and *Miohippus* the premolars except $p\frac{1}{1}$ are fully molariform and the feet much more progressive, three toes on fore and hind, the lateral digits reduced and median digit enlarged, the fifth digit of the fore foot reduced to a small short splint. *Parahippus* of the Lower Miocene and *Merychippus* of the Middle and Upper Miocene show a progressive increase in the height of the cheek teeth, with corresponding development of cement on the crown and change of pattern toward that of the later horses. The feet also progress, becoming fully unguligrade, the side toes further reduced and no longer resting on the ground, while the central metapodial becomes longer

and more tubular.

Pliohippus of the Lower and *Plesippus* of the Upper Pliocene have the teeth further elongated and the pattern progressively nearer to that of *Equus*, the lateral digits reduced to splints, very long in the former, shortened up in the latter genus.

Equus proper appears at the base of the Pleistocene in America and was widely distributed during that period (*see* HORSE, *fossil*) surviving to-day in Asia and Africa.

Side branches of this phylum are *Anchitherium* and *Hypohippus* of the Miocene and Pliocene, retaining the short-crowned teeth and other characters of *Miohippus* but increasing progressively to the size of a small horse (*Hypohippus matthewi*, Pliocene); and *Hipparion* of the Pliocene retaining the three-toed feet of *Merychippus* but with progressive teeth of a pattern somewhat diverse from the *Equus* line. Both these side branches originated in America but found their way to the Old World, *Anchitherium* in the Miocene, *Hipparion* in the Pliocene, as did *Equus* itself in the Pleistocene. The region of evolution and dispersal of the family appears on present evidence to have been North America. A third side branch, *Hippidium, Onohippidium,* is found in South America. It is of the size of *Equus* but has shorter legs and a peculiarly modified nasal opening in the skull; the cheek teeth are very like those of *Pliohippus*.

Many of the later Tertiary Equidae have a deep pit or fossa on the skull in front of the orbit, which has been variously explained as indicating a proboscis (like tapirs) or a scent gland (like deer), but is now believed to have lodged an air-sac communicating with the front end of the nasal passages, remnants of which are found in modern horses.

EQUILIBRIUM, ANIMAL. If we had to construct a machine to imitate a man one of our many difficulties would be to arrange it so as to walk and run, or even to stand upright, without falling over. We should have to contrive so that every movement of the limbs would call into play some compensating device which would redress the balance and keep it within the narrow limits imposed by the small base of support. The problem would be easier if our machine were to imitate a four-footed animal, but it would still be difficult enough. One of the most interesting topics of present-day physiology is that concerned with the equilibrium of the body at rest and in motion, and considerable advances have been made in the past few years.

To maintain the normal posture of the body constant muscular activity is necessary; this must be controlled by the central nervous system, and the central nervous system must be directed by the messages received from the various sense organs which indicate what kind of adjustment is necessary and how well it is succeeding. An analysis of the mechanism of equilibrium must therefore begin with the sense organs which guide it. These are the labyrinth organs in the internal ear, the sense organs in the muscles, tendons, joints and skin, and, in many animals, the eyes.

In man it is obvious that the eyes play an important part in balancing the body. We can see the relation of our body to the ground and if we shut our eyes it is much more difficult to stand upright with the feet close together. Anyone who experiences a steeply banked turn in an aeroplane for the first time will realize that the eyes are not the only sense organ concerned in giving us a frame of reference in space. The horizon seems to tilt and the aeroplane to remain level owing to the effect of centrifugal force on the labyrinth organs which make us feel that "up" and "down" are still where they were before in relation to our seat in the aeroplane. In man, therefore, the eyes can be overruled by the labyrinths; but it is a remarkable fact that in many animals the eyes seem to give no information at all as to the position of the animal in space. Magnus and his co-workers at Utrecht have shown that an animal suspended in any position above the ground has a tendency to turn the head into the normal position, *i.e.*, the position it would take up if the animal were standing on the level. In monkeys, cats and dogs, as in man, the "righting" of the head in space is dependent on messages received from the eyes as well as from the labyrinth organs. The righting will still take place after the destruction of the labyrinths, provided that the animal can see, but if it is blindfolded the head hangs limply and no attempt is made to raise it. But in rabbits and guinea pigs, the destruction of the labyrinths stops the righting reaction completely and the eyes play no part in it. In fact the optical righting reactions are only present when the eyes and their nervous connections in the brain are highly developed.

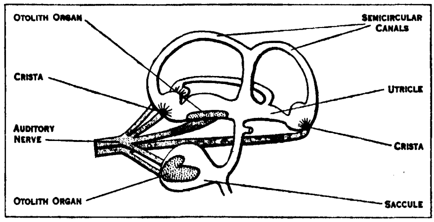

FIG. 1.—THE MEMBRANOUS LABYRINTH AND ITS NERVOUS CONNECTIONS IN THE INTERNAL EAR; ENTIRELY RELATED TO POSTURE AND EQUILIBRIUM, THOUGH CLOSELY CONNECTED WITH THE HEARING APPARATUS

The reactions due to the labyrinth organs are found in all the vertebrates, and the labyrinth is the one sense organ entirely concerned with posture and equilibrium. It consists of a series of membranous chambers and tubes immersed in fluid and contained in the bony cavity of the inner ear. In mammals the labyrinth is closely joined to the cochlea, the sense organ responsive to sound, but the two are supplied by separate branches of the viii. cranial nerve and the branches have separate connections in the brain stem. The membranous part of the labyrinth is composed of two small bags, the saccule and the utricle, and three semicircular canals which open into it and lie in three planes at right angles to one another (*see* fig. 1). The nerve fibres which supply the labyrinth (the vestibular division of the viii. nerve) end in close connection with a number of cells furnished with hair-like projections and grouped together to form the two otolith organs in the saccule and utricle and the three cristae of the semicircular canals. In the otolith organs the hairs are embedded in a gelatinous substance containing small masses of calcium carbonate called otoliths. The hairs of the cristae are much longer and the gelatinous substance round them has no otoliths.

The action of the different parts of the labyrinth is still far from clear, though there is no doubt about the action of the organ as a whole. When the animal is at rest the labyrinth signals the direction of the earth's gravitational attraction; when the animal is in motion it signals any change in acceleration due either to rotation or to movement in a straight line. If the labyrinths are destroyed on both sides, an animal without optical righting reflexes hangs limply when held in the air instead of struggling to right itself. Other sense organs can come into play when the body is in contact with the ground and the animal can then move from an abnormal into the normal posture because the abnormal distribution of pressure on the body surface gives the necessary information to the nervous system. In man equilibrium can be maintained without the labyrinth organs by the aid of the eyes and the sense organs of the muscles and body surface, and it is so maintained in congenital deaf mutes whose inner ear is imperfectly developed. But a man with defective labyrinths if blindfolded and placed in water so as to equalize the pressure on the body, becomes completely helpless and has no longer any notion of the position of his body in space.

The ceaseless activity of the labyrinth and its overwhelming influence on the posture of the body is shown most clearly from the effects of destruction of one labyrinth leaving the other intact. Bilateral destruction will not produce a serious disturbance of equilibrium unless the other sense organs (eyes, body wall,

muscles, etc.) are out of action as well, but unilateral destruction allows the nervous system to be subjected to the labyrinthine stimuli from one side only and the result is a gross distortion of posture often combined with violent rolling movements of the body about its long axis. The sudden convulsive attacks of Menière's disease are due to the same lack of balance between the two labyrinths in patients with disease of the inner ear.

It is generally supposed that the labyrinth acts by signalling (a) the pull of gravity on the otoliths of the saccule and utricle and (b) the movement of fluid past the cristae of the semi-circular canals caused by angular or linear acceleration of the head, the otolith organs being responsible for the steady posture of the animal at rest and the semi-circular canals for the balancing of the body in movement. This view was based on the earlier work of Breuer and Mach, and until recently it seemed to be confirmed, for mammals at least, by the experiments of Magnus and de Kleijn in which the otolith organs were destroyed without injury to the semi-circular canals. But the latest results tend to show that it is not possible to draw a clear distinction between the static and dynamic apparatus of the labyrinth, for there is evidence of preservation of the static reactions in mammals after the otolith organs have been destroyed. This agrees with the observations of Maxwell in fish, where either otoliths or semi-circular canals can be put out of action without producing any marked disturbance of equilibrium either at rest or in motion. For the present, therefore, we must be content to take the labyrinth as a whole without attempting to draw a sharp distinction between the functions of the otoliths and the canals.

Apart from the eyes and the labyrinths, the nervous system is continually receiving messages from the sense organs in the muscles, tendons and joints and from those responsive to pressure and touch. The former group signal the position of the head and limbs in relation to the body and the amount of tension each muscle is exerting. The latter show where the weight is resting.

The nervous mechanism for co-ordinating these sensory messages is centered in the brain stem just below the cerebral hemispheres. Both the cerebrum and the cerebellum may be removed without interfering with the balancing power of an animal as high in the scale as a cat or dog, but no trace of any posture, normal or abnormal, remains if the brain stem is destroyed down to the level of the medulla (*see* fig. 2). If only the upper part of the brain stem is destroyed, the nervous mechanism is seriously damaged, but it is still able to produce something like a co-ordinated posture. The limbs are rigidly extended and the trunk arched backwards so that the animal would be in something like its normal standing position if it were placed on its feet. This condition is known as "decerebrate rigidity" and Sherrington's investigation of it and appreciation of its meaning has been the starting point of the whole analysis of the postural mechanism carried out recently by Magnus.

In decerebrate rigidity the only postural reactions which remain are of no use to the animal. The extended position of the limbs is retained for hours, but the animal cannot stand by itself and makes no attempt to change its position if placed on its back or side. Yet there is no doubt that the posture of decerebrate rigidity is brought about by the same nervous mechanism (or what remains of it) as that normally responsible for the act of standing. The same muscles are brought into play and the force of contraction in the different muscles depends in the same way on sensory messages from the labyrinths and from the muscles themselves. Thus a change in the position of the head relative to the ground alters the distribution of the rigidity owing to the stimulation of the labyrinths, and the amount of contraction in each muscle is governed by the sensory impulses arising from it, so that the pull is just adequate to the load.

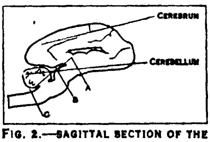

FIG. 2.—SAGITTAL SECTION OF THE BRAIN OF A CAT

Section at A leaves postural reactions intact; section at B gives decerebrate rigidity, and at C abolishes all reactions except those from neck muscles

There is one group of sensory impulses from muscles which has a special influence on the distribution of the rigidity and plays an important part in the normal posture. These are the impulses arising from sense organs in the muscles of the neck. If the head is bent out of its normal position relative to the trunk one or other set of neck muscles will be stretched, the sense organs in the muscle will be stimulated and so any deviation from the normal relation of head and body will be signalled at once to the brain. The effect of these impulses can be seen most clearly after the destruction of the labyrinths, since these also will be stimulated by head movements. When the labyrinths are destroyed it is found that bending the head into any position will modify the posture of the body and limbs, usually in such a way as to bring the trunk into line with the head. For instance, if the head is bent upwards the rigidity increases in the fore limbs and diminishes in the hind limbs, so that the animal squats on its haunches with the body inclined upwards in line with the head; if the head is rotated, the extension of the limbs increases on the side towards which the jaw is turned, so that the body tends to rotate on its long axis in the same direction as the head.

The discovery of these reactions arising from the neck muscles in decerebrate rigidity provided the clue to the analysis of the postural reactions in animals with the brain stem intact. We have seen that an animal suspended in mid air brings its head into the normal position owing to impulses from the labyrinths reinforced in some cases by the eyes. This initial righting of the head will bend the neck and start a fresh set of sensory impulses from the neck muscles, and these will produce the movements needed to bring the body into line with the head. Thus the position of the head in relation to the earth is determined by the labyrinths and the position of the body is determined by that of the head.

In an animal with the brain stem intact, these two sets of reflexes enable the animal to regain its normal posture; they do not merely indicate how it might be regained, as they do in decerebrate rigidity. A third set of reflexes also appears when the brain stem is intact, reflexes arising from unequal stimulation of the body wall and enabling the animal to bring its body into the normal position even though the head is prevented from righting itself. These are not equally developed in all animals; it is well known, for instance, that the best way to keep a horse lying on its side is to sit on its head. Here the body is not righted independently, though righting movements follow once the head is released.

By the co-operation of these reflexes an animal with intact brain stem can bring its body into the normal standing posture. To maintain its equilibrium during movement a further series of reflexes comes into play depending partly on impulses from the eyes and labyrinths and partly on impulses from the muscles. Many of these have been worked out in detail and, as before, the nervous control is carried out by the brain stem.

There is, however, a vast difference between the behaviour of an intact animal and one deprived of its cerebrum. The latter can stand, walk and run and it may even show some spontaneous activity, but it has none of the variety of movement of a normal animal. When the cerebrum is absent, the maintenance of equilibrium is the dominating activity; when it is intact an animal like a dog or a cat can lie on its side and turn its head in all directions without turning its body. The postural reactions are no longer dominant though the animal is still dependent on them for its normal equilibrium. The greater the development of the cerebral hemispheres the less easy does it become to trace the sequence of reactions involved in balancing the body, and in man, though it is possible to detect the postural reflexes from the labyrinths, eyes and neck muscles, there is none of the mechanical obedience to them which we find in a guinea pig or a rabbit. For the adjustments necessary when movement is so largely controlled by the cerebrum, the brain stem mechanism is probably reinforced by the cerebellum which is closely linked with it and with the cerebrum.

The exact function of the cerebellum is still to some extent a puzzle, for its removal in a normal animal causes gross incoordination and no other symptoms, yet in an animal with the cerebrum destroyed the presence or absence of the cerebellum

makes no difference. The explanation appears to be that in the higher mammals the cerebellum has become a subordinate part of the cerebral apparatus and so has little function when the cerebral control is removed. Until we know more of the cerebellar mechanism, the finer details of muscular adjustment will remain uncertain, and this applies particularly to the balancing reactions which are acquired after infancy; *e.g.*, those involved in riding a bicycle. But the basic reactions of equilibrium are those of the brain stem and their analysis has already shown what may be achieved by the co-operation of a few fairly simple reflexes.

For equilibrium of forces, etc., *see* MECHANICS; for chemical equilibrium *see* CHEMICAL ACTION; for other forms of physical equilibria *see* RADIATION, THEORY OF; THERMODYNAMICS; RADIOACTIVITY. (E. D. A.)

EQUINOX, a term used to express either the moment at which, or the point at which, the sun apparently crosses the celestial equator. (From the Lat. *aequus*, equal, and *nox*, night.) Since the sun moves in the ecliptic, it is in the last-named sense the point of intersection of the ecliptic and the celestial equator. This is the usual meaning of the term in astronomy. There are two such points, opposite each other, at one of which the sun crosses the equator toward the north and at the other toward the south. They are called vernal and autumnal respectively, from the relation of the corresponding times to the seasons of the northern hemisphere. The line of the equinoxes is the diameter of the celestial sphere which joins them. The vernal equinox, alternatively called the First Point of Aries, is the initial point from which the right ascensions and the longitudes of the heavenly bodies are measured (*see* ASTRONOMY; *Spherical;* also PRECESSION OF THE EQUINOXES).

Equinoctial Gales.—At the time of the equinox it is commonly believed that strong gales may be expected. This popular idea has no foundation in fact, for continued observations have failed to show any unusual prevalence of gales at this season. In one case observations taken for 50 years show that during the five days from March 21 to 25, and from September 21 to 25, there were fewer gales and storms than during the preceding and succeeding five days.

EQUITABLE DEFENCE, in English law, the defence made in a court of equity, differing from the defence made in a court of law, in that it requires equitable jurisdiction, as in cases of fraud (*see* EQUITY).

EQUITABLE TRUST COMPANY OF NEW YORK, THE, founded on April 19, 1871, as the Traders Deposit Company, began business with an authorized capital of $50,000. In 1902 the name was changed to The Equitable Trust Company of New York and its activities extended to include every banking and trust function. On April 2, 1902, the paid-in capital stock was increased to $1,000,000 and in 1903 to $3,000,000. Subsequent growth in capitalization has been as follows: (1917) $6,000,000; (1919) $12,000,000; (1922) $20,000,000; (1923) $23,000,000; (1926) $30,000,000. The Equitable Trust Company has developed into a bank of world-wide connections with capital, surplus and undivided profits of over $50,000,000 and total resources of over $500,000,000. It recently erected a 42 storey bank and office building at 11 Broad street, New York. The bank's activities include every form of domestic and foreign banking service, personal and corporate fiduciary service and bond investment service. Subsidiary companies are the Equitable Eastern Banking Corporation, handling the company's Far East business; The Equitable Securities Co. Inc. and The Equitable Safe Deposit Company of New York. (A. W. L.)

EQUITES (Lat. *eques*, a horseman), originally a division of the Roman army, but subsequently a political order. Romulus is said to have instituted a patrician cavalry corps, consisting of three *centuriae* ("hundreds"), called after the three tribes from which they were taken (Ramnes, Tities, Luceres). Servius Tullius found six centuries in existence, to which he added 12, including plebeians, making 18 in all, a number which remained unchanged throughout the republican period. In the early constitution the *equites* had the privilege of leading the voting, but after 220 B.C. the *centuria praerogativa,* which enjoyed that right, was selected by lot from the *equites* and the *prima classis*.

Origin of the Order.—Although the *equites* were selected from the wealthiest citizens, service in the cavalry was so expensive that the state gave financial assistance (*aes equestre, aes hordearium*); hence the name *equites equo publico*. In later times, pay was substituted for the *aes hordearium,* three times as much as that of the infantry.

As the demands upon the services of the cavalry increased, it was decided to supplement the regulars by the enrolment of wealthy citizens who kept horses of their own. The origin of these *equites equo privato* dates back, according to Livy (v. 7), to the siege of Veii, when a number of young men came forward and offered their services. In later times vacancies in the ranks were filled in this manner, with the result that service in the cavalry, with either a public or a private horse, became obligatory upon all Roman citizens possessed of a certain income. Thus, at a comparatively early period, three classes of equites may be distinguished: (a) The patrician equites *equo publico* of the *sex suffragia*; (b) the plebeian equites in the twelve remaining centuries; (c) the equites *equo privato,* both patrician and plebeian.

The *equites* were chosen by the *curiae*, then in succession by the kings, by the consuls, and (after 443 B.C.) by the censors, by whom they were reviewed every five years in the Forum. Those whose physique and character, horses, and equipments were satisfactory, were bidden to lead their horse on (*traducere equum*), those who failed to pass the scrutiny were expelled from the corps. This inspection (*recognitio*) must not be confounded with the procession (*transvectio*) on July 15 from the temple of Mars to the temple of Castor, to commemorate the miraculous intervention of Castor and Pollux at the battle of Lake Regillus. Inspection and procession were discontinued before the end of the republic, but revived and combined by Augustus.

In theory, the twelve plebeian centuries were open to all free born youths of the age of seventeen, although in practice preference was given to the members of the older families. Other requirements were sound health, high moral character and an honourable calling. At the beginning of the republican period senators were included in the equestrian centuries. The only definite information as to the amount of fortune necessary for an *eques* refers to later republican and early imperial times, when it is known to have been 400,000 sesterces (about £3,500 to £4,000). The insignia of the *equites* were at first military—such as the purple-edged, short military cloak (*trabea*).

Later Development.—With the extension of the Roman dominions, the *equites* lost their military character. They remained at home, or only went out as members of the general's staff, their places being taken by the cavalry of the allies and subject populations. There grew up in Rome a class of wealthy men, who amassed large fortunes by speculation, and who handled state contracts and the farming of the public revenues. These tax-farmers (*see* PUBLICANI) were already in existence at the time of the second Punic War; their numbers and influence increased as provinces were added to the Roman dominions. The change of the *equites* into a body of financiers was promoted (a) by the lex Claudia (218 B.C.), which prohibited senators from engaging in commercial pursuits; (b) by the enactment in the time of Gaius Gracchus (*q.v.*) excluding members of the senate from the equestrian centuries. These two measures distinguished the landed aristocracy from the capitalists. The term *equites* came to be applied to all who possessed the property qualification of 400,000 sesterces.

As the *equites* monopolized the farming of the taxes, they came to be regarded as identical with the *publicani* not, as Pliny remarks, because any particular rank was necessary to secure a concession for farming the taxes, but because such an occupation was beyond the reach of all except those who were possessed of considerable means. At the time of the Gracchi, these *equites-publicani* formed a close financial corporation, keenly alive to their own interests. Although looked down upon by the senate, they had as a rule sided with it, as less hostile to them than the democratic party. To obtain the support of the capitalists, Gaius

Gracchus handed over to them the control (a) of the jury-courts, and (b) of the revenues of Asia.

(a) Hitherto, the list of jurymen, civil and criminal, had been composed exclusively of senators. The result was that charges of corruption and extortion failed, when brought against members of that order, even in cases where there was little doubt of their guilt. Popular indignation rendered a change in the composition of the courts imperative. By the *lex Sempronia* (123 B.C.) the list was drawn from free men over thirty years of age, who must possess the equestrian census and must not be senators. This measure increased the burden of the provincials, whose only appeal lay to a body of men whose interests were identical with those of the *publicani*. Provided he left the tax-gatherer alone, the governor might squeeze what he could out of the people, while on the other hand, if he were humanely disposed, it was dangerous for him to remonstrate.

(b) The taxes of Asia had formerly been paid by the inhabitants in a fixed sum. Gracchus ordered that the taxes should be increased, and that the farming of them should be put up to auction at Rome. By this arrangement everything was left in the hands of the capitalists.

From this time the existence of the equestrian order was officially recognized. The *ordo iudicum* (the official title) and the *ordo equester* were regarded as identical. Certain privileges of the *equites*, the gold ring, special seats in the theatre and the narrow band on the tunic, were probably due to Gracchus.

In 82 B.C. Sulla restored the right of serving as *iudices* to the senate, to which he elevated 300 of the most influential *equites*, whose support he thus hoped to secure. By the *lex Aurelia* (70 B.C.) the *iudices* were chosen in equal numbers from senators, *equites* and *tribuni aerarii* (*see* AERARIUM), the last-named being closely connected with the *equites*. About this time the influence of the equestrian order reached its height, and Cicero's great object was to reconcile it with the senate. In this he was successful at the time of the Catilinarian conspiracy. But the union did not last long; shortly afterwards the majority ranged themselves on the side of Julius Caesar, who did away with the *tribuni aerarii* as *iudices*, and replaced them by *equites*.

The Equites under the Empire.—Augustus undertook the thorough reorganization of the equestrian order on a military basis. The term *equites* was officially limited to the *equites equo publico*, although all who possessed the property qualification were still considered to belong to the "equestrian order." For the *equites equo publico* high moral character, good health, and the equestrian fortune were necessary. Although free birth was considered indispensable, the right of wearing the gold ring (*jus anuli aurei*) was frequently bestowed by the emperor upon freedmen, who thereby became *ingenui* and eligible as equites. Tiberius, however, insisted upon free birth on the father's side to the third generation. Extreme youth was no bar; the emperor Marcus Aurelius had been an eques at the age of six. The sons of senators were eligible by right of birth, and appear to have been known as *equites illustres*. The right of bestowing the *equus publicus* was vested in the emperor; once given, it was for life, and was only forfeitable through degradation for some offence, or the loss of the equestrian fortune.

Augustus divided the *equites* into six *turmae* (troops), each under the command of a *sevir*, who was appointed by the emperor. During their term of command the *seviri* had to exhibit games (*ludi sevirales*). It is not known whether the *turmae* contained a fixed number of *equites;* Augustus certainly went far beyond the earlier figure of 1,800. Thus, Dionysius of Halicarnassus mentions 5,000 *equites* as taking part in a review at which he himself was present. The old insignia were retained and seats in the circus added to those in the theatre. The old *recognitio* was replaced by the *probatio*, conducted by the emperor assisted by an advisory board of senators. The ceremony was combined with a procession, which, like the earlier *transvectio*, took place on July 15. As in earlier times, offenders were punished by expulsion. The *equites* were required to serve in certain subordinate posts; *e.g.*, the command of an auxiliary cohort, the tribunate of a legion, etc., on the nomination of the emperor. After this they were eligible for a number of positions, civil and military, chiefly those under the emperor's personal control. Their influence over taxation was greatly reduced, while their judicial authority increased owing to the imperial jealousy of the senate. Certain minor religious functions were reserved to them, and they were eligible for official posts of which it would have been unwise to deprive senators.

The control of the imperial correspondence and purse was at first in the hands of freedmen and slaves. The Emperor Claudius entrusted certain posts connected with these to the *equites;* in the time of Hadrian this became the regular custom. Thus a civil career was open to the *equites* without the obligation of preliminary military service, and the emperor was freed from the pernicious influence of freedmen. After the reign of Marcus Aurelius, equestrian officials were divided into: (a) *viri eminentissimi*, the prefects of the praetorian guard; (b) *viri perfectissimi*, the other prefects and the heads of the financial and secretarial departments; (c) *viri egregii*, first mentioned in the reign of Antoninus Pius, a title by right of the procurators generally. The power of the *equites* was at its highest in the time of Diocletian. After the transference of the capital to Constantinople, they sank to the position of a mere city-guard, under the control of the prefect of the watch. Their history may be said to end with the reign of Constantine the Great.

Mention may also be made of the *equites singulares Augusti*. The body-guard of Augustus, consisting of foreign soldiers (chiefly Germans and Batavians), abolished by Galba, was revived from the time of Trajan or Hadrian under the above title. It was chiefly recruited from the pick of the provincial cavalry, but contained some Roman citizens. It never left the city except to accompany the emperor. In the time of Severus, these *equites* were divided into two corps, each having its separate quarters, and was commanded by a tribune under the orders of the prefect of the praetorian guard. They were subsequently replaced by the *protectores Augusti*. *See* ROME: *History*.

Heitland, *The Roman Republic* (1923).

EQUITY. The term equity has two meanings, one professional, the other popular. When lawyers speak of equity they are thinking merely of that part of the law of England which is derived not from the custom of the realm nor the enactments of parliament but from the decisions of the old court of chancery. On the other hand, when the man in the street talks of equity he is thinking of ideal justice which is not regulated by the law and may be even contrary to the law. The popular meaning of equity is that which it originally bore in the court of chancery.

Fictions.—Sir Henry Maine has classified the agencies by which primitive law has been adapted to the requirements of an advancing society and an improving morality according to the order in which these agencies most forcibly exert their influence. First come fictions by which unavowed reforms of the primitive law are brought about either by the courts applying the old law on the assumption that a state of facts exists which in fact does not exist or by their so interpreting the old law as to make it apply to matters it was never intended to cover. The common law courts relied much on fictions of both kinds. As an example of the first, down to the Judicature Act of 1873, the law was that a trespass was not actionable unless it was perpetrated *vi et armis*. Whether the trespass was committed *vi et armis* or not, the common law courts allowed the plaintiff to plead that it was and refused to let the defendant call evidence to show that it was not. As an example of the second, the Statute *in consimili casu*, which was intended by the legislature merely to enable courts to give remedies for new forms of tort, was so applied as to give remedies for promises based on valuable consideration by treating breaches of these as torts. Hence the whole law of simple contracts.

The common law courts never went beyond fictions as a means of reforming the law; the court of chancery never appealed to them. It appealed openly to abstract justice. The king, as *pater*

patriae, had a duty to see that none of his subjects was denied a remedy where conscience required that he should have one, and this duty he delegated to his chancellor who became the keeper of the king's conscience and kept that conscience clean by insisting that every litigant coming before him should act as a conscientious man should. Hence the maxim that the king's bench was a court of law but the court of chancery a court of conscience.

For generations equity consisted in whatever the chancellor or the masters of the rolls thought just in any particular case. No attention was paid to precedent or to principle; even in the time of the Stuarts, nobody thought a knowledge of law necessary for a chancellor. Sir Thomas More was the first professional lawyer chancellor. His successors were sometimes lawyers, sometimes priests and sometimes laymen. The last layman chancellor was the famous earl of Shaftesbury in the reign of Charles II.

Precedent.—A change, however, was impending. Before Shaftesbury's time young practitioners in the chancery had begun to report the court's decisions. As soon as this took place old practitioners began to cite to chancellor all the decisions of previous chancellors which favoured the decision they desired. When the facts were identical, the chancellor felt bound, as a rule, to follow the decisions of his predecessors. As lawyers became the only chancellors, the practice grew. Lord Nottingham in William's reign observed this practice; Lord Hardwicke, a generation later, established it as binding and Lord Eldon in his long chancellorship consolidated it as part of the law of the land. After the Eldon era equity may be said to have been hardened into a set of principles as unalterable by subsequent decisions as those of the common law.

A legal remedy is given *ex debito justiciae;* an equitable remedy is given by grace of the king. When a plaintiff asks the court to grant him his legal remedy he is demanding his legal right—the right which the law gives him. If he can prove facts which establish his right to the remedy, the court has no option but to give it. But the court is never obliged to give an equitable remedy. There the plaintiff (formerly called the suitor or petitioner) prays for a remedy he is not by law entitled to, and he is given it by grace of the king in obedience to conscience. The court before granting an equitable remedy enquires into the conduct of all parties to the action, and where it is not satisfied that justice requires it, refuses the remedy or grants it subject to conditions. Thus equitable remedies are always in the discretion of the court.

Stipulations in Equity.—The principles regulating the exercise of this discretion are now fairly well settled. One is that "he who seeks equity must do equity." Thus a debtor who seeks to recover securities which he has deposited with an unregistered money-lender to cover a loan must repay the loan, though it is a bad debt in law, before the court will assist him. Again, "he who comes into equity must come with clean hands." Thus a trustee who has in breach of trust, though honestly, paid trust money to one not entitled to it cannot recover the money back, as he would have to rely on what was his own breach of trust. Again, "delay defeats equity." The Statutes of Limitation do not *prima facie* apply to actions for equitable remedies, but if a person knowing he has a claim against another unduly delays enforcing his claim, the court will refuse to entertain his action. Again, the remedy of the common law for breaches of contract or torts was damages and damages mean compensation. This did not appear to equity to be satisfactory. It held that A must purge his conscience in the first case by carrying out his promise specifically (*e.g.*, to sell land) and in the second case by surrendering all profits he made through his wrong (*e.g.*, breach of copyright). In other words, the equitable remedies were specific performance of the contract and restitution of the wrongful gains. Again, common law never gave a remedy till a wrong was done. Equity was always willing, where possible, to prevent a defendant soiling his conscience by doing what was wrong. Sometimes it refused to interfere unless the person complaining did not apply to it before the wrong was done. Thus A has an ancient light over B's land. B begins to build on his land on a plan that if completed must obstruct A's lights. A can claim damages at law only after his light is actually obstructed, but ordinarily if he wants his equitable remedy by injunction he must apply for it before obstruction has taken place (see *Stanley* v. *Shrewsbury*, L.R. 19 Equity 616). Thus, often the equitable remedy comes to an end as soon as the legal remedy begins. Under Lord Cairns' Act, equity can now give equitable damages for a contemplated wrong. (See *Leeds Industrial Society Ltd.* v. *Slack*, 1924, A.C., 1924.)

It used to be said that equity followed the law, which amounted to no more than this: that it followed the law when it saw no good reason not to do so. This maxim seems on the way to being reversed. Recent legislation has been all tending towards making the law follow equity. Thus now all interests in lands, save fee simples and absolute leases, are declared to be equitable. Moreover, the old notion of equity as justice independent of law is returning in the shape of judicial discretions. To take one example: formerly a restraint upon anticipation prevented a married woman or anyone else from alienating her separate property during coverture. Whether it does so now or not depends on the discretion of the court. How that discretion will be exercised in any particular case no counsel can tell. Selden complained in his time that what was equity depended on the length of the chancellor's foot. It seems that before long what is law will depend on the state of the judge's digestion. *See* CHANCERY. (J. A. St.)

EQUIVALENT, in chemistry, the proportion of an element which will combine with or replace unit weight of hydrogen. When multiplied by the valency it formerly gave the atomic weight; in 1905, however, the standard for the calculation of atomic weights was changed from hydrogen = 1 to oxygen = 16. (*See* ATOMIC WEIGHTS; and CHEMISTRY.) In a more general sense the term "chemical equivalent" is used to denote quantities of elements, compounds or radicals which combine with, displace or in any way cause the migration of unit weight of hydrogen. This more extended conception of the term is fundamental in volumetric analysis and indicates the amounts of each reagent to be taken for a normal solution, as, for example, NaOH, HCl, $\frac{1}{2}H_2SO_4$, $\frac{1}{2}Ba(OH)_2$, $HgNO_3$, $\frac{1}{5}KMnO_4$, $\frac{1}{6}K_2Cr_2O_7$.

ERARD, SEBASTIEN (1752–1831), French manufacturer of musical instruments, distinguished especially for the improvements which he effected in the harp and the pianoforte, was born at Strasbourg on April 5, 1752. He constructed (1780) in Paris his first pianoforte, one of the first manufactured in France. He was soon overwhelmed with commissions, and sent for his brother, Jean Baptiste, in conjunction with whom he established in the rue de Bourbon, in the Faubourg St. Germain, his famous piano manufactory. On the outbreak of the Revolution he went to London where he continued to make pianos. Returning to Paris in 1796, he began to build grand pianofortes, made in the English fashion, with improvements of his own. In 1808 he again visited London, where, two years later, he produced his first double-movement harp. In 1812 he returned to Paris where, in 1823, he crowned his work by producing his model grand pianoforte with the double escapement. He died at Passy on Aug. 5, 1831. (*See* also HARP and PIANOFORTE.)

ERASISTRATUS, *fl.* 300 B.C., Alexandrian anatomist, was born at Chios, and lived first at the court of Nicanor Seleucus and then at Alexandria, where he formed a school of anatomy. Like Herophilus, he traced the origin of the nerve trunks to the brain and distinguished sensory and motor nerves. But unlike Herophilus, he rejected the old humoral pathology and supposed that the arteries contained pneuma or "vital spirits" which, when it escapes, allows the blood to flow from the veins into the arteries, thus making it possible for the arteries to bleed. Any hindrance in the action of the pneuma, or any overflow of the blood into the arteries, resulted in disease, yet, curiously enough, he did not advocate blood-letting. Erasistratus is to be credited with a detailed knowledge of the convolutions of the brain, the investigation of the bile, spleen and liver, and of the anatomy of the heart, the naming of the trachea, and the invention of a catheter.

ERASMUS, DESIDERIUS (?1466–1536), the greatest humanist of the Renaissance, theologian, was born on the night of the 27/28 of October, probably in 1466; but his statements about his age are conflicting, and in view of his own uncertainty (*Ep.* x. 29, 466) the year of his birth cannot be definitely fixed.

His father's name seems to have been Rogerius Gerardus. He himself was christened Herasmus; but he assimilated the name to a fancied Greek original, which he Latinized into Desyderius. He styled himself Desiderius Erasmus Roterodamus (*Adagia*, 2nd ed., Paris, 1906), and believed that he was born at Rotterdam, though a contemporary tradition assigned Gouda, his father's native place, as the place of his birth[1].

His first schooling was at Gouda under Peter Winckel, who was afterwards vice-pastor of the church. In the dull round of "grammar" he was surpassed by his early friend and companion, William Herman. From Gouda the two boys went to the school attached to St. Lebuin's church at Deventer, which was one of the first in northern Europe to feel the influence of the Renaissance. Erasmus was there from 1475 to 1484, and when he left, had learnt from Johannes Sinthius (Syntheim) and Alexander Hegius, who had come as headmaster in 1483, the love of letters which was the ruling passion of his life. At some period, perhaps in an interval of his time at Deventer, he was a chorister at Utrecht under the famous organist of the cathedral, Jacob Obrecht.

About 1484 Erasmus' father died, leaving him and an elder brother Peter, both born out of wedlock, to the care of guardians, their mother having died of plague shortly before. Erasmus was eager to go to a university, but the guardians sent the boys to another school at Hertogenbosch to be prepared for a monastic life; the discipline was severe, directed to the subjugation of the spirit, and inspired Erasmus with a hatred of the pedagogic method of the day. Peter entered the monastery of Sion, near Delft; Erasmus after prolonged reluctance became an Augustinian canon in St. Gregory's at Steyn, a house of the same chapter near Gouda. There he seems to have been allowed to read the classics and the Fathers with his friends to his heart's content, and he formed a close friendship with Servatius Roger of Rotterdam. The monastery once entered, there was no drawing back; and Erasmus passed through the various stages which culminated in his ordination as priest on April 25, 1492.

The young humanist found a patron in Henry of Bergen, bishop of Cambrai; and about 1494 permission was obtained for him to leave Steyn and become Latin secretary to the bishop. Erasmus found the life of a court unfavourable to study. His friend, James Batt, a schoolmaster of Bergen, secured for him an opportunity to go to Paris university. The bishop consented and promised a small pension; and in August 1495 Erasmus entered the "domus pauperum" of the college of Montaigu, then under the rule of Jan Standonck, a leader of the *devotio moderna*, the Dutch movement for the purification of the monastic orders. Erasmus made the acquaintance of Robert Gaguin (1425–1502) and published a small volume of poems; and he became intimate with Johann Mauburnus (Mombaer). But the severe régime at Montaigu with its abstinence and discomfort was too hard for him. Every Lent he fell ill and had to return to Holland to recover. On his return to Paris in 1496, he lodged in the town, and took pupils. He was now occupied with some of the works which, later, made his fame; to this period belong the first drafts of the *Colloquies* and the *De Conscribendis Epistolis*.

Erasmus was then, and for a long time to come, dependent on the benevolence of patrons for the leisure he needed to satisfy his ardent craving for learning. The faithful Batt had sought a pension for him from Anne of Borsselen, the Lady of Veere, whose son Batt was now teaching. But as nothing promised at once, Erasmus accepted an invitation from one of his Paris pupils, William Blount, 4th Baron Mountjoy, to whom he was much attached, to visit England (1499–1500). In October he went to Oxford, where he found John Colet lecturing on the Epistle to the Romans. In Colet he found a kindred mind, and to Colet's influence must be ascribed the decision he then took to make serious theological study the real work of his life. He was happy in England, where he associated with Linacre Grocyn and More, as well as with Colet. Unfortunately a tiresome incident destroyed part of his happy impressions, for the small sum of money he had amassed in England was taken from him by the customs officer at Dover, as the law allowed no money to leave the country. Consequently he arrived in Paris (Jan. 1500) as poor as he left it.

In Paris he supported himself by pupils' fees and the dedications of books: the *Collectanea adagiorum*, a collection of short sayings from classical authors, in June 1500 to Mountjoy, and some devotional and moral compositions to Batt's patroness and her son. When the plague drove him from Paris, he went to Orleans or Tournehem or St. Omer, as the way opened. From 1502 to 1504 he was at Louvain, still declining to teach publicly; among his friends being the future Pope Adrian VI. He had been working hard at Greek, at the Fathers (above all at Jerome), and at the Epistles of St. Paul, fulfilling the promise made to Colet in Oxford, to give himself to sacred learning. But the bent of his reading is shown by the manuscript with which he returned to Paris at the close of 1504—Valla's *Annotations on the New Testament*, which Badius printed for him in 1505. In 1504 appeared at Antwerp his *Enchiridion Militis Christiani*. The book shows clearly the bent of his mind. It was a plea for a return to the source of Christianity in its primitive simplicity. He did not condemn, but he left aside as irrelevant the complicated mass of dogma and ceremonial of the church; he would return to the Bible and the early Fathers for the interpretation of Christian duty and Christian doctrine.

IN ENGLAND AND ITALY

In the autumn of 1505 Lord Mountjoy invited him again to England. He was introduced to William Warham, archbishop of Canterbury, Richard Foxe, bishop of Winchester and others. At length the opportunity came to fulfil his dream of seeing Italy. Baptista Boerio, the king's physician, engaged him to accompany his two sons thither as supervisor of their studies. In September 1506 he set foot on that sacred soil, and took his D.D. at Turin. For a year he remained with his pupils at Bologna, and then, his engagement completed, negotiated with Aldus Manutius at Venice for a new edition of his *Adagia* upon a very different scale. The volume of 1500 had been jejune, written when he knew nothing of Greek; 800 adages put together with scanty elucidations. In 1508 he had three thousand and more collected and gave the work a new title—*Chiliades adagiorum*.

To print the *Adagia* he had gone to Venice, where he lived with Andrea Torresano of Asola (Asulanus) and did the work of two men, writing and correcting proof at the same time. When it was finished, with an ample re-dedication to Mountjoy, a new pupil presented himself, Alexander Stewart, natural son of James IV. of Scotland—perhaps through a connection formed in early days at Paris. They went together to Siena and Rome and then on to Campania. When they returned to Rome, his pupil departed to Scotland; Erasmus also found a summons from Lord Mountjoy to England. At first Erasmus hesitated. He had made many friends in Aldus's circle—Marcus Musurus, John Lascaris, Baptista Egnatius, Paul Bombasius, Scipio Carteromachus; and his reception had been flattering, especially in Rome. In Rome he might have had the leisure which was so indispensable, but at price of the freedom to read, think, write what he liked. He decided, therefore, to go, though with regrets.

In the autumn he reached London, and in Thomas More's house in Bucklersbury wrote the witty satire which Milton found "in every one's hands" at Cambridge in 1628. The *Moriae encomium* remains the most read of the works of Erasmus, though he, himself, regarded it as of slight importance. In it kings and princes, bishops and popes alike are shown to be in bondage to Folly; and no class of men is spared. Its author was willing to be beholden to any one for leisure; but he would be no man's slave. For the next eighteen months he is lost to view; when he reappears in April 1511, he is leaving More's house and taking the *Moria* to be printed privily in Paris. Wherever they were spent, these must have been months of hard work. The long preparation and training, bought by privation and uncongenial toil, was over, and he was ready to apply himself to the scientific study of sacred letters. His English patrons were liberal. Fisher

[1]Erasmus himself possibly made his parent's story more romantic than it really was. His allusions to it supplied Charles Reade with the starting point for the novel he wrote on the troubled background of the day, *The Cloister and the Hearth*.

sent him in August 1511 to teach in Cambridge; Warham gave him a benefice, Aldington in Kent, and in violation of his own rule commuted it for a pension of £20 charged on the living; and the dedications of his books were fruitful. In Cambridge he completed his work on the New Testament, the Letters of Jerome, and Seneca; and then in 1514 he removed to Basle to superintend the publication of his works. The last few months spent in England had seen the production, generally supposed to be his, of the *Julius Exclusus*, the satire on the lately-deceased warrior pope, Julius II.

The origin of Erasmus's connection with Johann Froben is not clear. In 1511 he was preparing to reprint his *Adagia* with Jodocus Badius, who was also to have Seneca and Jerome. But in 1513 Froben, who had just reprinted the Aldine *Adagia*, acquired through a bookseller-agent Erasmus's amended copy which had been destined for Badius. Within a few months Erasmus went to Basle, bearing with him Seneca and the *Letters* of Jerome, the latter to be incorporated in the great edition which Johannes Amerbach and Froben had had in hand since 1510. In Germany he was widely welcomed and fêted. Through the winter of 1514–1515 Erasmus worked with the strength of ten; and after a brief visit to England in the spring, he had printed his New Testament containing the Greek text, with notes, and his own new Latin translation. It was dedicated to Pope Leo X., who accepted the dedication. Around him was a circle of students—the three sons of Froben's late partner, Johannes Amerbach, Beatus Rhenanus, Wilhelm Nesen, Ludwig Ber, Heinrich Glareanus, Nikolaus Gerbell, Johannes Oecolampadius—who were proud to serve him.

Though from this time forward Basle became the centre of occupation and interest for Erasmus, yet for the next few years he was mainly in the Netherlands. On the completion of the New Testament in 1516 he returned to his friends in England; but his appointment, then recent, as councillor to the young king Charles, brought him back to Brussels in the autumn. In 1514 he had refused a summons to return to his monastery at Steyn, and in the spring of 1517 he went for the last time to England, to receive a dispensation from wearing his canonical dress, obtained originally from Julius II. and recently confirmed by Leo X., and in 1518 he spent three months in Basle to set the second edition of the New Testament in progress. He lived much at Louvain, where he took great interest in the foundation of Hieronymus Busleiden's Collegium Trilingue. He was now at the height of his fame. The general ardour for the restoration of the arts and of learning created an aristocratic public, of which Erasmus was supreme pontiff. Luther spoke to the people and the ignorant; Erasmus had the ear of the educated class. His friends and admirers were distributed over all the countries of Europe, and his letters, those witty and humane letters which mirror the man's tolerant, liberal mind, were coveted by scholars and princes. He received many rich presents, and with these and the proceeds of his works, lived comfortably, though not luxuriously. The excessive delicacy of his constitution exacted some unusual indulgences. He could not bear the stoves of Germany, and required an open fireplace in the room in which he worked. He was afflicted with the stone, and obliged to be particular as to what he drank. Beer he could not touch. The white wines of Baden or the Rhine did not suit him; he could only drink those of Burgundy or Franche-Comté. He could neither eat, nor bear the smell of, fish. "His heart," he said, "was Catholic, but his stomach was Lutheran." For his constant journeys he required two horses, one for himself and one for his attendant. And he had to maintain amanuenses and couriers. Nevertheless he refused offers of preferment from many countries, because he was determined, at all costs, to maintain his liberty.

In November 1521 he settled permanently at Basle, as general editor and literary adviser of Froben's press. As a subject of the emperor, and attached to his court by a pension, it would have been convenient to him to have fixed his residence in Louvain. But the atmosphere of the university, overrun with Dominicans and Franciscans, united for once in their enmity to the new classical learning, inclined Erasmus to Basle. During the years of Erasmus's co-operation the Froben press took the lead of all the presses in Europe, both in the standard value of the works published and in typographical execution. The series of the Fathers alone issued from it contains Jerome (1516), Cyprian (1520), Pseudo-Arnobius (1522), Hilarius (1523), Irenaeus (Latin, 1526), Ambrose (1527), Augustine (1528), Chrysostom (Latin, 1530), Basil (Greek, 1532, the first Greek author printed in Germany), and Origen (Latin, 1536). In these editions, partly texts, partly translations, it is impossible to determine the respective shares of Erasmus and his many helpers. The prefaces and dedications are all written by him, and some of them, as that to the Hilarius, are of importance for the history of the times and of Erasmus.

In this "mill," as he calls it, Erasmus continued to grind incessantly for eight years. Besides his work as editor, he was always writing himself some book or pamphlet called for by the event of the day, by some general fray in which he was compelled to mingle, or by some personal assault which it was necessary to repel. These years at Basle saw a revised edition of the *Colloquies* (1522), and he continued to add to the book until the *Familiarum Colloquiorum Opus* in its final state (1526) contained twenty more dialogues. He also wrote at this time homiletic works, and the *Institutis Christiani Matrimonii* for Catherine of Aragon. He was besieged for dedications, and for letters. "I receive daily," he writes, "letters from remote parts, from kings, princes, prelates and men of learning, and even from persons of whose existence I was ignorant." Meanwhile he steadily refused to take definite sides against Luther, though he repeatedly said he was not acquainted with him and his works, and that his business was with the revival of letters. In 1524 the steady pressure on him induced him at last to enter into controversy with Luther. He chose a point on which they must always differ. Erasmus, whose life was spent in vindicating the dignity and liberty of the human spirit, would have nothing to do with the Lutheran determinism, and wrote the *De Libero Arbitrio* (1524), which drove Luther in *De Servo Arbitrio* to formulate his own doctrine more clearly.

Shortly after Froben's death (1527) the disturbances at Basle and the triumph of the reformers made it necessary for Erasmus to leave Basle in 1529. He selected Freiburg in the Breisgau, where he was received with public marks of respect by the authorities, who granted him the use of an unfinished palace intended for the late emperor Maximilian. Erasmus eventually bought a house of his own, and remained there six years. He returned to Basle in 1535. He lived now a very retired life, and saw only a small circle of intimate friends. A last attempt was made by the papal court to persuade him to declare against the Reformation. On the election of Paul III. in 1534, he had, as usual, sent the new pope a congratulatory letter. He received a complimentary answer, together with the nomination to the deanery of Deventer, the income of which was reckoned at 600 ducats, and an intimation that steps would be taken to provide for him the income, viz., 3,000 ducats, which was necessary to qualify for the cardinal's hat. The offer was made in the hope of obtaining the help of Erasmus as a mediator in the council projected to restore union in the Church. But Erasmus declined. In the winter of 1535–1536 he was confined entirely to his chamber, many days to his bed. He worked up to the end. His last letter is dated the 28th of June, 1536, and subscribed "Eras. Rot. aegra manu." He died on July 11, 1536, in his 70th year.

By his will, made on the 12th of February 1536, he left his fortune, with the exception of some legacies, to Bonifazius Amerbach, partly for himself, partly in trust for the benefit of the aged and the infirm, or to be spent in portioning young girls, and in educating young men of promise. He left none of the usual legacies for masses or other clerical purposes, and was not attended by any priest or confessor in his last moments.

PERSONALITY AND CHARACTER

Erasmus's features are familiar to all, from Holbein's many portraits or their copies. Beatus Rhenanus describes him as short of stature, but graceful in build. His complexion was fair; light blue eyes, and yellowish hair. Though his voice was weak, his enunciation was distinct; the expression of his face cheerful; his manner and conversation polished, affable, even charming. His

highly nervous organization made his feelings acute, and his brain incessantly active. Erasmus had many moods and each mood imprinted itself in turn on his words. Hence, on a superficial view, Erasmus is set down as the most inconsistent of men. Further acquaintance makes us feel a unity of character underlying this susceptibility to impressions. His seeming inconsistencies were the fruits of the many-sidedness of a highly impressible nature. In the words of J. Nisard, Erasmus was one of those "dont la gloire a été de beaucoup comprendre et d'affirmer peu."

This equal openness to every vibration of his environment is the key to the middle attitude which he adopted towards the religious conflict. He was accused by Catholics of collusion with the enemies of the faith. His powerful friends, the pope, Wolsey, Henry VIII., the emperor, called upon him to declare against Luther. Theological historians from that time forward have presented Erasmus in the odious light of a trimmer; yet it was not mere timidity or weakness which kept Erasmus neutral, but the reasonableness of his nature. His intellect revolted against the narrowness of party, and his whole being repudiated its clamorous and vulgar excesses. He loathed clerical fanaticism. And when out of Luther's revolt there arose a new fanaticism, Erasmus recoiled from the violence of the new preachers. "Is it for this," he writes to Melanchthon (*Ep.* xix. 113, 703), "that we have shaken off bishops and popes, that we may come under the yoke of such madmen as Otto and Farel?" In the words of Drummond: "Erasmus was in his own age the apostle of common sense and of rational religion. He did not care for dogma, and accordingly the dogmas of Rome, which had the consent of the Christian world, were in his eyes preferable to the dogmas of Protestantism. . . . From the beginning to the end of his career he remained true to the purpose of his life, which was to fight the battle of sound learning and plain common sense against the powers of ignorance and superstition, and amid all the convulsions of that period he never once lost his mental balance."

In the mind of Erasmus there was no metaphysical inclination; he was a man of letters, with a general tendency to rational views on every subject which came under his pen. He is at his weakest in defending free will against Luther, and indeed he can hardly be said to enter on the metaphysical question. He treats the dispute entirely from the outside. It is impossible in reading Erasmus not to be reminded of the rationalists of the 18th century. Erasmus has been called the "Voltaire of the Renaissance." But there is a vast difference in the relations in which they respectively stood to the church and to Christianity. Voltaire, though he did not originate, yet adopted a moral and religious scheme which he sought to substitute for the church tradition. He waged war, not only against the clergy, but against the church and its sovereigns. Erasmus drew the line at the first of these. He was not an anticipation of the 18th century; he was the man of his age, as Voltaire of his; though Erasmus did not intend it, he undoubtedly shook the ecclesiastical edifice in all its parts; and, as Melchior Adam says of him, "pontifici Romano plus nocuit jocando quam Lutherus stomachando." But though he remained Catholic and mourned the disruption, he was yet a true rationalist in principle. The principle that reason is the one only guide of life, the supreme arbiter of all questions, politics and religion included, has its earliest and most complete exemplar in Erasmus. He does not dogmatically announce the rights of reason, but he practically exercises them. Apart from the charm of style, the great attraction of the writings of Erasmus is this unconscious freedom by which they are pervaded.

In the annals of classical learning Erasmus may be regarded as intermediary between the humanists of the Latin Renaissance and the learned men of the age of Greek scholarship, between Angelo Poliziano and Joseph Scaliger. Erasmus, though justly styled by Muretus (*Varr.* Lectt. 7, 15) "eruditus sane vir, ac multae lectionis," was not a "learned" man in the special sense of the word—not an "érudit." He was a "man of letters"—the first who had appeared in Europe since the fall of the Roman empire. In editing a Father, or a classic, he had in view the practical utility of the general reader, not the accuracy required by the gild of scholars. It must be remembered that the commercial interests of Froben's press led to the introduction of Erasmus's name on many a title page when he had little to do with the book, *e.g.*, the Latin *Josephus* of 1524 to which Erasmus only contributed one translation of 14 pages; or the *Aristotle* of 1531, of which Simon Grynaeus was the real editor.

Of Erasmus's works the Greek Testament is the most memorable. Its influence upon opinion was profound and durable. As an edition of the Greek Testament it has no critical value. But it was the first, and it revealed the fact that the Vulgate, the Bible of the church, was not only a second-hand document, but in places an erroneous document. A shock was thus given to the credit of the clergy in the province of literature, equal to that which was given in the province of science by the astronomical discoveries of the 17th century. Even if Erasmus had had at his disposal the mss. subsidia for forming a text, he had not the critical skill required to use them. He had at hand a few late Basle mss., one of which he sent straight to press, correcting them in places by collations of others which had been sent to him by Colet in England. In four reprints, 1519, 1522, 1527, 1535, Erasmus gradually weeded out many of the typographical errors of his first edition, but the text remained essentially such as he had first printed it. The Greek text indeed was only a part of his scheme. An important feature of the volume was the new Latin version, the original being placed alongside as a guarantee of the translator's good faith. This translation, with the justificatory notes which accompanied it, became the starting-point of modern exegetical science. Erasmus did not solve the problem, but to him belongs the honour of having first propounded it.

Besides translating and editing the New Testament, Erasmus paraphrased the whole, except the Apocalypse, between 1517 and 1524. The paraphrases were received with great applause, even by those who had little appreciation for Erasmus. In England a translation of them made in 1548 was ordered to be placed in all parish churches beside the Bible. His correspondence is perhaps the part of his works which has the most permanent value; it comprises about 3,000 letters, which form an important source for the history of that period. For the same purpose his *Colloquia* may be consulted. They are a series of dialogues, written first for pupils in the early Paris days as formulae of polite address, but afterwards expanded into lively conversations, in which many of the topics of the day are discussed. Later in the century they were read in schools, and some of Shakespeare's lines are direct reminiscences of Erasmus.

His complete works have been printed twice; by the Froben firm under the direction of his literary executors (9 vols., Basle, 1540); and by Leclerc at Leiden (11 vols., 1703–06). The letters were edited by P. S. Allen (5 vols., 1906–12). For his life the chief contemporary sources are a *Compendium vitae* written by himself in 1524, and a sketch prefixed by Beatus Rhenanus to the Basle edition of 1540. Of his writings he gives an account in his *Catalogus lucubrationum,* composed first in January 1523 and enlarged in September 1524; and also in a letter to Hector Boece of Aberdeen, written in 1539. An elaborate bibliography, entitled *Bibliotheca Erasmiana* was undertaken by the officials of the Ghent University Library; it is divided into three sections, for Erasmus's writings, the books he edited, and the literature about him. *Listes sommaires* were issued in 1893; and since 1897 the completed volumes have been appearing at intervals. There is an excellent sketch of Erasmus's life down to 1519 in F. Seebohm's *Oxford Reformers* (3rd ed., 1887); and of the many biographies those by S. Knight (1726), J. Jortin (2 vols., 1758–1760) and R. B. Drummond (2 vols., 1873); Preserved Smith, *Erasmus, A Study of his Life, Ideals and Place in History* (Lond. and New York, 1923); J. Huizinga, *Erasmus* (New York, 1924) may be mentioned. There are also three volumes (1901–17) of translations by F. M. Nichols from Erasmus's letters down to 1517, with an ample commentary which amounts almost to a biography. *See* also P. S. Allen, *The Age of Erasmus* (Oxford, 1914); and Preserved Smith, *The Age of Erasmus* (New York, 1920). (M. PA.; X.)

ERASTUS, THOMAS (1524–1583), German-Swiss theologian, whose surname was Lüber, Lieber or Liebler, was born of poor parents on Sept. 7, 1524, probably at Baden, Aargau, Switzerland. His adopted name survives in the word "Erastian." He was physician to the count of Henneberg, Saxe-Meiningen, and in 1558 held the same post with the elector-palatine, Otto Heinrich, being at the same time professor of medicine at Heidelberg. His patron's successor, Frederick III., made him (1559) a privy councillor and member of the church consistory. In theology he followed Zwingli,

and at the sacramentarian conferences of Heidelberg (1560) and Maulbronn (1564) he advocated the Zwinglian doctrine of the Holy Communion, replying (1565) to the counter arguments of the Lutheran, Johann Marbach, of Strasbourg. He ineffectually resisted the efforts of the Calvinists, led by Caspar Olevianus, to introduce the Presbyterian polity and discipline, which were established at Heidelberg in 1570, on the Genevan model. One of the first acts of the new church system was to excommunicate Erastus on a charge of Socianianism, founded on his correspondence with Transylvania. The ban was not removed till 1575. In 1580 Erastus returned to Basel, where in 1583 he was made professor of ethics. He died on Dec. 31, 1583.

His name is permanently associated with a posthumous publication, written in 1568. Its immediate occasion was the disputation at Heidelberg (1568) for the doctorate of theology by George Wither or Withers, an English Puritan (subsequently archdeacon of Colchester), silenced (1565) at Bury St. Edmunds by Archbishop Parker. Withers had proposed a disputation against vestments, which the university would not allow; his thesis affirming the excommunicating power of the presbytery was sustained. Hence the Latin treatise of Erastus on excommunication, *Explicatio*, etc., published (1589) by Giacomo Castelvetri, who had married his widow. It consists of seventy-five *Theses,* followed by a *Confirmatio* in six books, and an appendix of letters to Erastus by Bullinger and Gualther, showing that his *Theses,* written in 1568, had been circulated in manuscript. An English translation of the *Theses,* with a brief life of Erastus (based on Melchior Adam's account), was issued in 1659, entitled *The Nullity of Church Censures;* it was reprinted as *A Treatise of Excommunication* (1682), and, as revised by Robert Lee, D.D., in 1844. The aim of the work is to show, on Scriptural grounds, that sins of professing Christians are to be punished by civil authority, and not by withholding of sacraments on the part of the clergy. In the Westminster Assembly a party holding this view included Selden, Lightfoot, Coleman and Whitelocke, whose speech (1645) is appended to Lee's version of the *Theses;* but the opposite view, after much controversy, was carried, Lightfoot alone dissenting. "Erastianism" denotes the doctrine of the supremacy of the state in ecclesiastical causes; but the problem of the relations between church and state is one on which Erastus nowhere enters. The only direct reply made to the *Explicatio* was the *Tractatus de vera excommunicatione* (1590) by Theodore Beza.

See A. Bonnard, *Thomas Éraste et la discipline ecclésiastique* (1894); Gass, in *Allgemeine deutsche Biog.* (1877); G. V. Lechler and R. Stähelin, in A. Hauck's *Realencyklop. für prot. Theol. u. Kirche* (1898).

ERATOSTHENES OF ALEXANDRIA (*c.* 276–*c.* 194 B.C.), Greek scientific writer, was born at Cyrene. He studied grammar under Callimachus at Alexandria, and philosophy under the Stoic Ariston and the Academic Arcesilaus at Athens, but returned to Alexandria as chief librarian. His two mathematical books *On means* (Περὶ μεσοτήτων), now lost, appear, from a remark of Pappus, to have dealt with "loci with reference to means." He devised a mechanical construction for two mean proportionals, reproduced by Pappus and Eutocius (Comm. on Archimedes). His *κόσκινον* or *sieve* (*cribrum Eratosthenis*) was a device for discovering all prime numbers. He laid the foundation of mathematical geography in his *Geographica.* His greatest achievement was his measurement of the earth. Being informed that at Syene (Assuan), on the day of the summer solstice at noon, a well was lit up through all its depth, so that Syene lay on the tropic, he measured, at the same hour, the zenith distance of the sun at Alexandria. He thus found the distance between Syene and Alexandria (known to be 5,000 stadia) to correspond to $\frac{1}{50}$ of a great circle, and so arrived at 250,000 stadia (which he seems subsequently to have corrected to 252,000) as the circumference of the earth. His *Erigone,* of which a few fragments remain, was probably a part of his astronomical poem *Hermes.*

Eratosthenes was the founder of scientific chronology in his *χρονογραφία* in which he endeavoured to fix the dates of the chief literary and political events from the conquest of Troy. An important work was his treatise on the old comedy, dealing with theatres and theatrical apparatus generally, and discussing the works of the principal comic poets themselves. Works on moral philosophy, history and a number of letters were also attributed to him.

The fragments were edited by Bernhardy (1822); poetical fragments, Hillier (1872); geographical, Seidel (1799) and Berger (1880); *τκαασταριςμοί*, Schaubach (1795) and Robert (1878). *See* Sandys, *Hist. Class. Schol.* (3rd ed. 1921).

ERBACH, a town of Germany, in the republic of Hesse, on the Mümling, 22 m. S.E. of Darmstadt. Pop. (1925) 3,466. It has long been the residence of the counts of Erbach, who trace their descent back to the 12th century. In 1532 the emperor Charles V. made the county a direct fief of the Empire. The county was mediatized in 1806.

Erbach has cloth mills and ivory-turning, for which last branch it possesses a technical school. Wool and cattle fairs are held twice a year. The castle contains an interesting collection of weapons and pictures, and in the chapel are the coffins of Einhard, the friend and biographer of Charlemagne, and his wife, Emma.

ERBIUM, a metallic element belonging to the rare-earth group. It was discovered in 1843 by Mosander who originally named the oxide terbia; the names terbia and erbia were interchanged a few years later by men working in this field. In 1878 Marignac separated erbium into erbium and "ytterbium," and in 1879 Soret and Cleve separated this purified erbium into holmium, erbium and thulium. Erbium occurs with its allied elements in the minerals gadolinite, euxenite, xenotime, etc. It has the symbol Er, atomic number 68, atomic weight 167·7. It is best separated by the crystallization of the bromates and by boiling the nitrate solution with sodium nitrite, when a basic erbium nitrate is precipitated before that of yttrium. Erbium forms a rose-pink oxide, Er_2O_3, which dissolves slowly in many acids, giving rose-coloured salts, solutions of which show a strong characteristic absorption spectrum. (*See* RARE EARTHS.)

ERCILLA Y ZÚNIGA, ALONSO DE (1533–1594), Spanish soldier and poet, distinguished himself in the campaign in Chile against the Araucanians, but, having quarrelled with one of his comrades, was condemned to death by his general, García Hurtado de Mendoza. The sentence was commuted to imprisonment, but Ercilla was speedily released and fought at the battle of Quiapo (Dec. 14, 1558). He returned to Spain in 1562 with the first 15 cantos of his epic poem, *La Araucana* (1569). Continuations appeared in 1578 and 1589-90. *La Araucana* reveals the qualities of an orator rather than a poet; it lacks symmetry and abounds in irrelevant episodes and mythological digressions. In spite of its defects, however, it remains the best artistic epic of its kind in Spain.

ERCKMANN-CHATRIAN, the joint name of two French writers who wrote in close collaboration. ÉMILE ERCKMANN (1822–1899) was born on May 20, 1822, at Phalsbourg and died at Lunéville on March 14, 1899. ALEXANDRE CHATRIAN (1826–1890) was born on Dec. 18, 1826 at Soldatenthal, Lorraine, and died at Villemomble, near Paris, on Sept. 3, 1890. In 1847 they began to write together, and continued doing so till 1889. They wrote *Histoires et contes fantastiques* (1849; reprinted from the *Démocrate du Rhin*), *L'Illustre Docteur Mathéus* (1859), *Madame Thérèse* (1863), *L'Ami Fritz* (1864), *Histoire d'un conscrit de 1813* (1864), *Waterloo* (1865), *Le Blocus* (1867), *Histoire d'un paysan* (4 vols., 1868–70), *L'Histoire du plébiscite* (1872), to *Le Grand-père Lebigue* (1880). Erckmann wrote some successful plays, among them being *Le Juif polonais* (1869) and *Les Rantzau* (1882). Without any special literary claim, the Erckmann-Chatrian stories are distinguished by simplicity and genuine descriptive power, particularly in the battle scenes and in connection with Alsatian peasant life. They are marked by a sincere democratic spirit. Some of the tales written after 1870 are strongly anti-German, but the main body of their work dealing with the Napoleonic wars is anti-imperialistic. The authors attacked militarism by depicting the horrors of war in the plainest terms.

See also J. Claretie, *Erckmann-Chatrian* (1883), in the series of "Célébrités contemporaines."

ERDÉLYI, JÁNOS (1814–1868), Hungarian poet and author, was born on April 1, 1814 at Kapos. His fame was made by his collection of Hungarian national poems and folk-tales, *Magyar Népköltési Gyüjtemény, Népdalok és Mondák* (Budapest, 1846–47). This work, published by the Kisfaludy Society, was supplemented by a dissertation upon Hungarian national poetry, afterwards partially translated into German by Stier (1850). He died on Jan. 23, 1868. A collection of folklore was published the year after his death, entitled *A Nép Költészete népdalok, népmesék és közmondások* (Budapest, 1869). This work contains 300 national songs, 19 folk-tales and 7,362 Hungarian proverbs.

See J. Erdélyi, and others, *The Folk-Tales of the Magyars*, publ. by the Folk-Lore Society (trans. and ed. by W. H. Jones and L. L. Kropf 1889); M. Lajos, *Janos Erdélyi 1814–1868* (Budapest, 1914).

ERDMANN, BENNO (1851–1921), German philosopher, was born on May 30, 1851, at Guhrau, in Prussian Silesia. Educated at Berlin and Heidelberg, he was appointed professor successively at Kiel (1878), Breslau (1884), Halle (1890), Bonn (1898) and Berlin (1909). He occupied himself mainly with Kantian philosophy and the investigation of thought-processes. He died on Jan. 7, 1921, in Berlin. His publications include: *Kants Kritizismus* (1878); *Nachträge zu Kants Kritik der reinen Vernunft* (1881); *Reflexionen Kants zur kritischen Philosophie* (1882–84); *Logik* (1892; 2nd ed., 1907); *Psych. Untersuchungen über das Lesen auf experimentaler Grundlage* (1898); *Immanuel Kant* (1904); *Wissenschaftliche Hypothesen über Leib und Seele* (1908) and *Reproduktions-psychologie* (1920).

See E. Wentscher in *Kant Studien*, vol. xxvi. (1921), and Überweg, *Gesch. der Philosophie* (bd. iv., 1923).

ERDMANN, DAVID (1821–1905), German Protestant theologian, was born on July 20, 1821, at Güstebiese, and was educated at Berlin. He was appointed professor of theology at Königsberg in 1856, and eight years later general-superintendent of Silesia at Breslau, becoming superior consistorial counsellor in 1889. Erdmann died at Dresden on March 11, 1905.

His chief works are: *Lieben und Leiden der ersten Christen* (1854); *Die Reformation und ihre Märtyrer in Italien* (1855), and *Luther und die Hohenzollern* (2nd ed., 1884). *See* also Eberlein, *Aus einem reichen Leben: Blätter der Erinnerung an D. Erdmann* (1907).

ERDMANN, JOHANN EDUARD (1805–1892), German philosophical writer, was born at Wolmar, Livonia, on June 13, 1805. He studied theology at Dorpat and afterwards at Berlin, where he fell under the influence of Hegel. From 1829 to 1832 he was a pastor in Wolmar. He qualified in philosophy at Berlin in 1834, and in 1836 became professor at Halle, where he died on June 12, 1892. Erdmann's fame rests on his elaborate *Grundriss der Geschichte der Philosophie* (2 vols., 1866, Eng. trans. 1892).

ERDMANN, OTTO LINNÉ (1804–1869), German chemist, son of Karl Gottfried Erdmann (1774–1835), the physician who introduced vaccination into Saxony, was born at Dresden on April 11, 1804. He studied at the University of Leipzig where in 1827 he became extraordinary professor, and in 1830 ordinary professor of chemistry. This office he held until his death at Leipzig on Oct. 9, 1869. The laboratory established at Leipzig under his direction in 1843 was long regarded as a model institution. As an investigator he is best known for his work on nickel and indigo and other dye-stuffs. With R. F. Marchand (1813–50) he also carried out a number of determinations of atomic weights. In 1828, in conjunction with A. F. G. Werther (1815–69), he founded the *Journal für technische und ökonomische Chemie*, which became in 1834 the *Journal für praktische Chemie*. He was also the author of *Über das Nickel* (1827), *Lehrbuch der Chemie* (1828), *Grundriss der Waarenkunde* (1833) and *Über das Studium der Chemie* (1861).

EREBUS, the "darkness" of the western region where lie Hades and the sunless Cimmerian land (Gr. ἔρεβος); in Hesiod (*Theog.* 123), personified as son of Chaos, brother and husband of Night, father of Αἰθήρ (upper air) and Day.

ERECH (in Sumerian *Uruk*, Greek *Orchoë*, modern Warka), an ancient city in Mesopotamia in 31° 30′ N., 46° E., on the west bank of the old bed of the Euphrates, now Shatt-ek-Kar, whose course runs some miles to the east. The city was partially excavated by Loftus in 1850 and 1854 and was recently visited by Weld who reported that it was almost inaccessible, so that it still awaits a modern excavator. The outer walls are about six miles in circumference, and enclose an area of about eleven hundred acres. Within this area there are three great mounds and numerous smaller ones. The temple of E-Anna, "the house of heaven," apparently the earlier name of the city and the principal shrine, stood on the bank of the river in the eastern part of the town. The walls here were built by Ur-Engur and are of huge size and still more or less intact. They are built of bricks with a course every four feet of reed mats, from which the Arabic name of Buwaniya is derived. The base of the *ziggurat*, or temple tower, is 200 ft. square, and stood together with the temple at the western corner of the great platform, which was built with its angles facing the cardinal points. It was here that Loftus uncovered a kind of mosaic made of painted cone heads and cone shaped pots, with narrow tips and shallow cavities. The walls are built of cones or pots with the heads outwards. To the west of the temple separated by a ravine in the centre of the city is the huge mound of Wuswas, which it has been suggested may have been the site of the palace of the Pre-Sargonic kings and *patesis* (prince-priests). A large number of valuable religious texts from the temple library have been discovered dating from as late as 70 B.C. They show the religious ideas of the priestly school at Erech. The town was strongly nationalist during the struggles against the Elamites at the end of the third millennium B.C., in strong contrast to its neighbour Larsa which had an Elamite dynasty, probably to hold Erech in check. The city continued to exist in Persian and later times and became like some of the modern Holy Cities a centre for the burial of the dead, but the ancient ruins which have as yet only been superficially examined are probably some of the most important in Mesopotamia.

BIBLIOGRAPHY.—W. K. Loftus, *Travels and Researches in Chaldaea and Susiana* (1857); S. Langdon in *Cambridge Ancient History*, vol. i. (1923) with bibliography.

ERECHTHEUM, a temple on the acropolis at Athens, socalled after the legendary founder of the city, Erechtheus, to whom a portion of it was dedicated. The date of the beginning of the building is uncertain; apparently, it was either just before the Peloponnesian War, 431 B.C., or immediately after the Peace of Nicias, 421 B.C. It remained, however, uncompleted until 409 B.C., when a commission was appointed to report upon its condition and carry it to completion. This was achieved, according to inscribed records, in 407 B.C. A fire seriously damaged it soon after it was finished, and extensive repairs were carried out in the first decade of the 4th century B.C. During the Roman period, probably towards the end of the 1st century A.D., the west end was reconstructed with the addition of the present windows. During the middle ages it served as a church, and after the Turkish occupation became the harem of the commandant. Lord Elgin carried away to London, 1801–03, one of the columns of the east portico and one of the caryatides. These were later replaced by terra-cotta replicas. The building was much injured during the siege of the Acropolis, 1827, and was partially reconstructed between 1838 and 1846. In 1852 the west wall fell during a storm. In the 20th century a great deal of work has been done in reconstructing the building, using as far as possible the original blocks which remained on the site, together with information gathered from the detailed references in the inscriptions containing an account of the completion between 409 and 407 B.C. This work still (1928) continues.

Architectural Features.—The fame of the Erechtheum depends largely upon the exquisite perfection of its details. Particularly noticeable is the delicate strength of the bases with the reeding and the guilloche or interlacing that decorate them. The Ionic capitals are the most exquisite that Greece has produced, and the band of anthemion decoration, which runs around the walls and circles the column shafts just below the capitals, is characteristically refined. Many traces of colour were found on this carving. The volutes or spirals of the capitals were picked out with blue and gold on a red ground. The anthemion band had a red background and in the egg and dart moulding the ground was

blue with the eggs gilded.

The Erechtheum, as originally completed, consisted of a rectangular cella or enclosed portion with a door and two windows opening on the east into an entrance portico of six columns. The western end of this enclosed portion is at a lower level and forms a narrow chamber entered from the north by a door of great richness under a portico with four columns at the front and one at each side. At the other end of the western chamber another door and a small flight of steps lead up to the famous caryatid porch at a higher level. The plan of the building seems obviously incomplete as the western wall meets both the northern portico and the caryatid porch in an awkward manner.

A recent stone by stone examination of the Erechtheum carried out under the direction of Gorham Stevens of the American School of Classical Studies at Athens seems to have proved, however, that the present plan, whatever its awkwardness, was the plan of the building as first built. Instead of the Roman windows of the present west front, there were, originally, merely wooden screens placed between columns. The same study has made more clear the original interior arrangement. The central foundation walls which suggested to earlier students the idea that the building was divided into nave and aisles like the Parthenon (*q.v.*) are now definitely known to belong to the interior reconstruction made when the building was turned into a Christian church in the 5th or 6th century. The roof is shown by the inscriptions to have been in one span from wall to wall with a central great girder, braced with diagonal braces in a wooden coffered ceiling.

Between the eastern and western portions a marble partition ran through the entire height, dividing the building into two portions, entirely separate, without communication. The western section was apparently divided by low screen walls into a passage leading from the north porch to the caryatid porch and two chambers to the east. From the passage a third door led south into the sacred precinct known as the Pandroseion. In the south-west corner of the passage, large blocks of marble bridged over a deep hole or crypt. During the mediaeval period a cistern was built under this portion of the building and destroyed all vestiges of what was below. It is probable, however, that here was located the legendary salt spring or sea and the mark of Poseidon's trident in the rock. In the wall above this corner there was a curious section of projecting stone like a canopy, with a recess in the wall above it as if for a sacred object. In the north portico a square hole in the floor gives access to a crypt below; immediately above this there was a similar hole through the ceiling and roof. Recent research has proved that around the hole in the floor there was a hollow altar. The opening in the roof at once suggests a connection with the sky powers and the altar would thus be that of Zeus Hypatos, mentioned by Pausanius. Deep depressions in the floor of the crypt under the hole would then be identified as marks of the thunderbolt of Zeus.

According to Pausanius the Erechtheum contained a shrine of Athena Polias, an altar dedicated to Poseidon and Erechtheus, one to Butes and one to Hephaestus, as well as the golden lamp of Callimachus and portraits of the family of the Butadae.

See Stuart and Revett, *Antiquities of Athens* (1825); W. Dörpfeld, "Der ursprungliche Plan des Erechtheion" in *Mitteil. Athen.* (1904); A. Choisy, *Etude sur l'Architecture Grecque, III.* (1884); and for a most thorough examination of the problems presented by the Erechtheum, and a restoration, together with the complete text and a translation of the inscriptions, *see* G. P. Stevens and others, J. M. Paton, ed., *The Erechtheum, Measured, Drawn and Restored* (1927). *See* also ATHENS. (T. F. H.)

ERECHTHEUS, in Greek legend, a mythical king of Athens, sometimes identified with Erichthonius, oftener distinguished from him. According to Homer, who knows nothing of Erichthonius, he was the son of the earth, brought up by Athena, with whom his story is closely connected. In the later story, Erichthonius, son of Hephaestus and *Ge* (Earth), was handed over by Athena to the three daughters of Cecrops—Aglauros (or Agraulos), Herse and Pandrosos—in a chest, which they were forbidden to open. Two of them disobeyed the injunction, and when they saw the child (which had the form of a snake, or round which a snake was coiled) they went mad with fright, and threw themselves from the Acropolis (or were killed by the snake). Athena herself then undertook the care of Erichthonius, who, when he grew up, drove out Amphictyon and took possession of the kingdom of Athens. Here he established the worship of Athena, instituted the Panathenaea, and built an Erechtheum. The Erechtheus of later times was supposed to be the grandson of Erechtheus-Erichthonius, and was also king of Athens. When Athens was attacked by Eumolpus (*q.v.*) victory was promised Erechtheus if he sacrificed one of his daughters. Eumolpus was slain and Erechtheus was victorious, but was himself killed by Poseidon, the father of Eumolpus, or by a thunderbolt from Zeus. The contest between Erechtheus and Eumolpus formed the subject of a lost tragedy by Euripides. The name Erichthonius (perhaps "good earth") and his connection with snakes may indicate that he is an earth-god.

ERESHKIGAL, also known as ALLATU, the name of the chief Babylonian goddess of the nether-world where the dead are gathered. Her name signifies "lady of the nether-world." She is known to us chiefly through two myths, both symbolizing the change of seasons, but intended also to illustrate certain doctrines developed in the temple schools of Babylonia. One of these myths is the famous story of Ishtar's descent to Irkalla or Arālu, the lower world, and her reception by her sister who presides over it; the other is the story of Nergal's offence against Ereshkigal, his banishment to the kingdom controlled by the goddess and the reconciliation between Nergal and Ereshkigal through the latter's offer to have Nergal share the honours of the rule over Irkalla. The story of Ishtar's descent illustrates the possibility of an escape from Irkalla, while the other myth reconciles the existence of two rulers of Irkalla—a goddess and a god.

Originally a goddess was supposed to be in control of Irkalla, corresponding to Ishtar in control of fertility and vegetation on earth. Ereshkigal is therefore the sister of Ishtar and from one point of view her counterpart, the symbol of nature during the non-productive season of the year. As the doctrine of two kingdoms, one of this world and one of the world of the dead, becomes crystallized, the dominions of the two sisters are sharply differentiated from one another. The addition of Nergal represents the harmonizing tendency to unite with Ereshkigal as the queen of the nether-world, the god who, in his character as god of war and of pestilence, passes judgment upon the souls who arrive in Irkalla and thus becomes the one who presides over the dead. Ereshkigal was also worshipped by the Hittites as early as the 17th century B.C.

ERETRIA (mod. *Aletria*), an ancient coast town of Euboea about 15 m. S.E. of Chalcis, opposite to Oropus. Eretria, like its neighbour Chalcis (*q.v.*), founded colonies in the west and north of Greece. It also acquired dependencies among the Cyclades and had close alliance with Miletus. Defeated by Chalcis in the Lelantine War, it lost importance, and its interference in the Ionian revolt (498) brought upon it the vengeance of the Persians, who destroyed it shortly before the battle of Marathon (490). The city was soon rebuilt, and was a member of both the Delian Leagues. The Athenians twice rescued it from the tyrants suborned by Philip of Macedon (354 and 341). Under Macedonian and Roman rule it fell into insignificance; for a short period under Mark Antony, it became a possession of Athens. Eretria was the birthplace of the tragedian Achaeus and of the "Megarian" philosopher Menedemus.

The modern village, which is sometimes called Nea Psará because the inhabitants of Psará, off Chios, were transferred there in 1821, is on unhealthy low-lying ground near the sea. The ancient site was excavated by the American School of Athens (1890–95). At the foot of the Acropolis lies the theatre, where only seven rows of seats remain, but much of the scena is preserved: beneath which there runs a tunnel, which has raised in-

teresting questions, the orchestra being at present about 12 ft. below that of the rooms in the scena. Near by are a temple of Dionysus, a large altar and a gymnasium. In 1900 a temple of Apollo Daphnephoros was found. The wall of the Acropolis remains to the height of eight courses; other walls, to north and south connect it with the harbour and mole.

ERETRIAN SCHOOL OF PHILOSOPHY. This Greek school was the continuation of the Elian school, which was transferred to Eretria by Menedemus. It was of small importance, and in the absence of certain knowledge must be supposed to have adhered to the doctrines of Socrates. (*See* Menedemus.)

ERFURT, a city of Germany, in Prussian Saxony, on the Gera and the railway, about midway between Gotha and Weimar. Pop. (1925) 135,219. The origin of Erfurt (Med. *Erpesfurt, Erphorde,* Lat. *Erfordia*) is obscure, but in 741 it was sufficiently important for St. Boniface to found here a bishopric, which was, however, reabsorbed in that of Mainz. In 805 the place received certain market rights from the emperor Charlemagne. Later the overlordship was claimed by the archbishops of Mainz, on the strength of charters granted by the emperor Otto I., and they succeeded in upholding their claims to it in spite of many vicissitudes. In 1255, however, the archbishop granted the city municipal rights, and Erfurt became practically a free town. Its power was at its height early in the 15th century, when it joined the Hanseatic League. It had acquired by force or purchase various countships and other fiefs in the neighbourhood, and ruled a considerable territory; and its wealth was so great that in 1378 it established a university, the first in Europe that embraced the four faculties. Feuds with Mainz and the religious struggles of the 16th century caused its decay and during the Thirty Years' War Erfurt was for a while occupied by the Swedes. In 1664 it was captured by the troops of the archbishop of Mainz, and remained in the possession of the electorate till 1802, when it came into the possession of Prussia. In 1808 Napoleon and the emperor Alexander I. of Russia, with the kings of Bavaria, Saxony, Westphalia and Württemberg met here at the congress of Erfurt, and here in 1850 the parliament of the short-lived Prussian Northern Union (known as the Erfurt parliament) sat.

The city, which is dominated on the west by the two citadels of Petersberg and Cyriaxburg, is irregularly built, the only feature in its plan being the Friedrich Wilhelmsplatz. On the south-western side of this square is the Domberg, an eminence on which stand, side by side, the cathedral and the great church of St. Severus with its three spires (14th century). The cathedral (*Beatae Mariae Virginis*) was begun in the 12th century, but the nave was rebuilt in the 13th in the Gothic style. The chancel (1349–72), with the 14th-century crypt below, rests on massive substructures, known as the *Cavate*. The cathedral contains, besides fine 15th century glass, some very rich portal sculptures and bronze castings, among others the coronation of the Virgin by Peter Vischer. Besides the cathedral and St. Severus, Erfurt possesses several very interesting mediaeval churches; among these may be mentioned the Predigerkirche, dating from the latter half of the 12th century; the Reglerkirche, with a 12th century tower; and the Barfüsserkirche, a Gothic building containing fine 14th century monuments. All these were originally monastic churches. Of the former religious houses there survive a Franciscan convent, and an Ursuline convent. The Augustinian monastery, in which Luther lived as a friar, is now used as an orphanage, while a statue of the reformer stands in the chief street. At one time Erfurt had a university, whose charter dated from 1392; but it was suppressed in 1816, and its funds devoted to other purposes, among these being the endowment of an institution founded in 1758 and called the academy of sciences, and the support of the library, which now contains 60,000 volumes and over 1,000 manuscripts. On the west and south-west new quarters have grown up. Erfurt possesses a picture gallery and an antiquarian collection.

The educational establishments of the town include a school of agriculture, and an academy of music. The most notable industry of Erfurt is the culture of flowers and of vegetables. This industry had its origin in the large gardens attached to the monasteries. It has also manufactures of rolling stock, machines, furniture, woollen goods, ladies' mantles, boots, musical instruments, agricultural implements, leather, tobacco, chemicals, etc. Brewing, bleaching and dyeing are also carried on on a large scale.

ERGOT, a drug consisting of the sclerotium (or hard resting condition) of a fungus, *Claviceps purpurea,* parasitic on the pistils of many grasses, but obtained almost exclusively from rye. In the ear of rye infected with ergot there exudes a sweet, yellowish mucus, which after a time disappears. The ear loses its starch and ceases to grow, and its ovaries become permeated by the mycelium of the fungus which forms the sclerotium in autumn.

The drug consists of curved dark-purple grains ⅓ to 1½in. long, and 1 to 4 lines broad, having two lateral furrows, a rancid taste, and fishy odour, intensified by potash solution.

The active principle of ergot is the alkaloid ergotine which is given intra-muscularly. Other ingredients are a fixed oil, present to the extent of 30%, ergotinic acid, a glucoside, trimethylamine, which gives the drug its unpleasant odour, and sphacelinic acid, a non-nitrogenous resinoid body.

Ergot has no external action. Given internally the drug itself and ergotine cause contraction of unstriped muscle generally but act particularly on that of the arterioles, bronchioles and uterus. By its action on the blood-vessels it raises blood pressure and is locally and remotely haemostatic. By its action on the bronchioles it may induce a condition resembling asthma. With regard to uterine muscle ergot is the most powerful known stimulant of the pregnant uterus. The action is a double one. At least four of its constituents act directly on the muscular fibre of the uterus, whilst the ergotine acts through the nerves. Of great practical importance is the fact that ergotine causes rhythmic contractions such as naturally occur, whilst the sphacelinic acid produces a *tonic* contraction of the uterus, which is unnatural and endangers the life of the foetus.

Chronic poisoning, or *ergotism,* used frequently to occur amongst the poor fed on rye infected with the *Claviceps.* There were two types of ergotism. In the gangrenous form various parts of the body underwent gangrene from arrest of their blood-supply. In the spasmodic form the symptoms were nervous. The disease began with cutaneous itching, tingling and formication, which gave place to loss of cutaneous sensation, first observed in the extremities. Amblyopia, deafness and mental failure also occurred. With weakness of the voluntary muscles went intermittent spasms which weakened the patient and ultimately led to death by implicating the respiratory muscles. The last known "epidemic" of ergotism occurred in Lorraine and Burgundy in the year 1816, but sporadic cases are still met with.

ERIC XIV. (1533–1577), king of Sweden, was the only son of Gustavus Vasa and Catherine of Saxe-Lauenburg. He became king in 1561, and owing to his morbid fear of the nobility, he gave his confidence to Göran Persson, an upstart. Having quarrelled with, and imprisoned, the royal duke John, Eric harassed the aristocracy, and finally in 1566 imprisoned many of them at Uppsala. He murdered Nils Sture with his own hand and ordered the despatch of other prisoners. The order for the detention of the prisoners was ratified by the estates after the murders had taken place, and probably in ignorance of them, under pressure from Göran Persson. Two years later Eric's insanity was so apparent that a committee of senators was appointed to govern the kingdom, and finally on Sept. 30, 1568, he was replaced by the royal duke John, who became John III. In spite of several rebellions, John retained his throne, and on Feb. 24, 1577, Eric died suddenly in his prison at Orbyhus, poisoned, it is said, by his governor, Johan Henriksen.

ERICACEAE, in botany, a family of plants belonging to the higher or sympetalous division of dicotyledons. They are

mostly woody plants, with a slender creeping stem as in bilberry (blueberry), *Vaccinium* (fig. 1), or forming low bushes as in the heaths, or sometimes becoming tree-like, as in species of *Rhododendron*. The leaves are alternate, opposite or whorled in arrangement, and in form and structure show well-marked adaptation to life in dry or exposed situations. Thus in the true heaths they are needle-like, with the margins often rolled back to form a groove or an almost closed chamber on the under side. In others such as *Rhododendron* they are often leathery and evergreen, the strongly cuticularized upper surface protecting a water-storing tissue situated above the green layers of the leaf. The flowers are sometimes solitary and axillary or terminal as in *Andromeda*, but are generally arranged in racemose inflorescences at the end of the branches as in *Rhododendron*, or on small lateral shoots as in *Erica*. They are hermaphrodite and generally regular with parts in 4's or 5's, thus: sepals 4 or 5, petals 4 or 5, stamens 8 or 10 in two series, the outer opposite the petals, and carpels 4 or 5. The corolla is usually more or less bell-shaped, and in the heaths persists in a dry state in the fruit. The petals with the stamens are situated on the outer edge of a honey-secreting disk. The anthers show great variety in shape, the halves being often more or less free and often appendaged; they open to allow the escape of the pollen by

FIG. 1.—BILBERRY (VACCINIUM MYRTILLUS), CLOSELY ALLIED TO THE HUCKLEBERRY AND VERY COMMON IN BRITAIN

FIG. 2.—RHODODENDRON (RHODODENDRON ARBOREUM)

a terminal pore or slit. The carpels are united to form a 4- or 5-chambered ovary, which bears a simple elongated style ending in a capitate stigma; each ovary chamber contains one to many ovules attached to a central placenta. The brightly coloured corolla, the presence of nectar and the scent render the flowers attractive to insects, and the projection of the stigma beyond the anthers favours crossing. The fruit is generally a capsule containing many seeds, as in *Erica* or *Rhododendron* (fig. 2); sometimes a berry, as in *Arbutus*.

The family falls into four distinct tribes, characterized by the relative position of the ovary and by the fruit and seed. They are:—

1. *Rhododendroideae*, characterized by capsular fruit, seed with a loose coat, deciduous petals and anthers without appendages. It consists mainly of the large genus *Rhododendron* (in which *Azalea* is included), which is chiefly developed in the mountains of eastern Asia, many species occurring on the Himalayas. *Dabeocia*, St. Dabeoc's heath, occurs in Ireland. In eastern America, *Kalmia* (laurel) is the prominent genus after *Rhododendron*.
